Fischer (1889) illustrates the relation of jokes to the comic with the help of caricature, which in his account he places between them. The comic is concerned with the ugly in one of its manifestations: 'If it is concealed, it must be uncovered in the light of the comic way of looking at things; if it is noticed only a little or scarcely at all, it must be brought forward and made obvious, so that it lies clear and open to the light of day . . . In this way caricature comes about.' (Ibid., 45.) - 'Our whole spiritual world, the intellectual kingdom of our thoughts and ideas, does not unfold itself before the gaze of external observation, it cannot be directly imagined pictorially and visibly; and yet it too contains its inhibitions, its weaknesses and its deformities - a wealth of ridiculous and comic contrasts. In order to emphasize these and make them accessible to aesthetic consideration, a force is necessary which is able not merely to imagine objects directly but itself to reflect on these images and to clarify them: a force that can illuminate thoughts. The only such force is *judgement*. A joke is a judgement which produces a comic contrast; it has already played a silent part in caricature, but only in judgement does it attain its peculiar form and the free sphere of its unfolding.' (Ibid., 49-50.)

It will be seen that the characteristic which distinguishes the joke within the class of the comic is attributed by Lipps to action, to the active behaviour of the subject, but by Fischer to its relation to its *object*, which he considers is the concealed ugliness of the world of thoughts. It is impossible to test the validity of these definitions of the joke - indeed, they are scarcely intelligible - unless they are considered in the context from which they have been torn. It would therefore be necessary to work through these authors' accounts of the comic before anything could be learnt from them about jokes. Other passages, however, show us that these same authors are able to describe essential and generally valid characteristics of the joke without any regard to its connection with the comic.

The characterization of jokes which seems best to satisfy Fischer himself is as follows: 'A joke is a *playful* judgement.' (Ibid., 51.) By way of illustration of this, we are given an analogy: 'just as aesthetic freedom lies in the playful contemplation of things' (ibid., 50). Elsewhere (ibid., 20) the aesthetic attitude towards an object is characterized by the condition that we do not ask anything of the object, especially no satisfaction of our serious needs, but content ourselves with the enjoyment of contemplating it. The aesthetic attitude is *playful* in contrast to work. - 'It might be that from aesthetic freedom there might spring too a sort of judging released from its usual rules and regulations, which, on account of its origin, I will call a "playful judgement", and that in this concept is contained the first determinant, if not the whole formula, that will solve our problem. "Freedom produces jokes and jokes produce freedom", wrote Jean Paul. "Joking is merely playing with ideas."' (Ibid., 24.)

A favourite definition of joking has long been the ability to find similarity between dissimilar things - that is, hidden similarities. Jean Paul has expressed this thought itself in a joking form: 'Joking is the disguised priest who weds every couple.' Vischer carries this further: 'He likes best to wed couples whose union their relatives frown upon.' Vischer objects, however, that there are jokes where there is no question of comparing - no question, therefore, of finding a similarity. So he, slightly diverging from Jean Paul, defines joking as the ability to bind into a unity, with surprising rapidity, several ideas which are in fact alien to one another both in their internal content and in the nexus to which they belong. Fischer, again, stresses the fact that in a large number of joking judgements *differences* rather than similarities are found, and Lipps points out that these definitions relate to joking as an ability possessed by the joker and not to the jokes which he makes.

Other more or less interrelated ideas which have been brought up as defining or describing jokes are: 'a contrast of ideas', 'sense in nonsense', 'bewilderment and illumination'.

Definitions such as that of Kraepelin lay stress on contrasting ideas. A joke is 'the arbitrary connecting or linking, usually by means of a verbal association, of two ideas which in some way contrast with each other'. A critic like Lipps had no difficulty in showing the total inadequacy of this formula; but he does not himself exclude the factor of contrast, but merely displaces it elsewhere. 'The contrast remains, but it is not some contrast between the ideas attached to the words, but a contrast or contradiction between the meaning and the meaninglessness of the words.' (Lipps, 1898, 87.) He gives examples to show how this is to be understood. 'A contrast arises only because . . . we grant its words a meaning which, again, we nevertheless cannot grant them.' (Ibid., 90.)

If this last point is developed further, the contrast between 'sense and nonsense' becomes significant. 'What at one moment has seemed to us to have a meaning, we now see is completely meaningless. That is what, in this case, constitutes the comic process . . . A remark seems to us to be a joke, if we attribute a significance to it that has psychological necessity and, as soon as we have done so, deny it again. Various things can be understood by this "significance". We attach *sense* to a remark and know that logically it cannot have any. We discover *truth* in it, which nevertheless, according to the laws of experience or our general habits of thought, we cannot find in it. We grant it logical or practical consequences in excess of its true content, only to deny these consequences as soon as we have clearly recognized the nature of the remark. In every instance, the psychological process which the joking remark provokes in us, and on which the feeling of the comic rests, consists in the immediate transition, from this attaching of sense, from this discovering of truth, and from this granting of consequences, to the consciousness or impression of relative nothingness.' (Ibid., 85.)

However penetrating this discussion may sound the question may be raised here whether the contrast between what has meaning and what is meaningless, on which the feeling of the *comic* is said to rest, also contributes to defining the concept of the *joke* in so far as it differs from that of the comic.

The factor of 'bewilderment and illumination', too, leads us deep into the problem of the relation of the joke to the comic. Kant says of the comic in general that it has the remarkable characteristic of being able to deceive us only for a moment. Heymans (1896) explains how the effect of a joke comes about through bewilderment being succeeded by illumination. He illustrates his meaning by a brilliant joke of Heine's, who makes one of his characters, Hirsch-Hyacinth, the poor lottery-agent, boast that the great Baron Rothschild had treated him quite as his equal - quite 'famillionairely'. Here the word that is the vehicle of the joke appears at first simply to be a wrongly constructed word, something unintelligible, incomprehensible, puzzling. It accordingly bewilders. The comic effect is produced by the solution of this bewilderment, by understanding the word. Lipps (1898, 95) adds to this that this first stage of enlightenment - that the bewildering word means this or that - is followed by a second stage, in which we realize that this meaningless word has bewildered us and has then shown us its true meaning. It is only this second illumination, this discovery that a word which is meaningless by normal linguistic usage has been responsible for the whole thing - this resolution of the problem into nothing - it is only this second illumination that produces the comic effect.

Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine's 'famillionairely' depends on the solution of the apparently meaningless word, the 'joke' must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed.

Another peculiarity of jokes, quite unrelated to what we have just been considering, is recognized by all the authorities as essential to them. '*Brevity* is the body and the soul of wit, it is its very self,' says Jean Paul (1804, Part II, Paragraph 42), merely modifying what the old chatterbox Polonius says in Shakespeare's *Hamlet* (II, 2):

'Therefore, since brevity is the soul of wit
And tediousness the limbs and outward flourishes,
I will be brief.'

In this connection the account given by Lipps (1898, 90) of the brevity of jokes is significant: 'A joke says what it has to say, not always in few words, but in *too* few words - that is, in words that are insufficient by strict logic or by common modes of thought and speech. It may even actually say what it has to say by not saying it.'

We have already learnt from the connection of jokes with caricature that they 'must bring forward something that is concealed or hidden' (Fischer, 1889, 51). I lay stress on this determinant once more, because it too has more to do with the nature of jokes than with their being part of the comic.

I am well aware that these scanty extracts from the works of writers upon jokes cannot do them justice. In view of the difficulties standing in the way of my giving an unmistakably correct account of such complicated and subtle trains of thought, I cannot spare curious enquirers the labour of obtaining the information they desire from the original sources. But I am not sure that they will come back fully satisfied. The criteria and characteristics of jokes brought up by these authors and collected above - activity, relation to the content of our thoughts, the characteristic of playful judgement, the coupling of dissimilar things, contrasting ideas, 'sense in nonsense', the succession of bewilderment and enlightenment, the bringing forward of what is hidden, and the peculiar brevity of wit - all this, it is true, seems to us at first sight so very much to the point and so easily confirmed by instances that we cannot be in any danger of underrating such views. But they are *dijecta membra*, which we should like to see combined into an organic whole. When all is said and done, they contribute to our knowledge of jokes no more than would a series of anecdotes to the description of some personality of whom we have a right to ask for a biography. We are entirely without insight into the connection that presumably exists between the separate determinants - what, for instance, the brevity of a joke can have to do with its characteristic of being a playful judgement. We need to be told, further, whether a joke must satisfy *all* these determinants in order to be a proper joke, or need only satisfy *some*, and if so which can be replaced by others and which are indispensable. We should also wish to have a grouping and classification of jokes on the basis of the characteristics considered essential. The classification that we find in the literature rests on the one hand on the technical methods employed in them (e.g. punning or play upon words) and on the other hand on the use made of them in speech (e.g. jokes used for the purposes of caricature or of characterization, or joking snubs).

We should thus find no difficulty in indicating the aims of any new attempt to throw light on jokes. To be able to count on success, we should have either to approach the work from new angles or to endeavour to penetrate further by increased attention and deeper interest. We can resolve that we will at least not fail in this last respect. It is striking with what a small number of instances of jokes recognized as such the authorities are satisfied for the purposes of their enquiries, and how each of them takes the same ones over from his predecessors. We must not shirk the duty of analysing the same instances that have already served the classical authorities on jokes. But it is our intention to turn besides to fresh material so as to obtain a broader foundation for our conclusions. It is natural then that we should choose as the subjects of our investigation examples of jokes by which we ourselves have been most struck in the course of our lives and which have made us laugh the most.

Is the subject of jokes worth so much trouble? There can, I think, be no doubt of it. Leaving on one side the personal motives which make me wish to gain an insight into the problems of jokes and which will come to light in the course of these studies, I can appeal to the fact that there is an intimate connection between all mental happenings - a fact which guarantees that a psychological discovery even in a remote field will be of an unpredictable value in other fields. We may also bear in mind the peculiar and even fascinating charm exercised by jokes in our society. A new joke acts almost like an event of universal interest; it is passed from one person to another like the news of the latest victory. Even men of eminence who have thought it worth while to tell the story of their origins, of the cities and countries they have visited, and of the important people with whom they have associated, are not ashamed in their autobiographies to report their having heard some excellent joke.¹

¹ Von Falke's *Memoirs*, 1897.

II

THE TECHNIQUE OF JOKES

Let us follow up a lead presented to us by chance and consider the first example of a joke that we came across in the preceding chapter.

In the part of his *Reisebilder* entitled 'Die Bäder von Lucca' Heine introduces the delightful figure of the lottery-agent and extractor of corns, Hirsch-Hyacinth of Hamburg, who boasts to the poet of his relations with the wealthy Baron Rothschild, and finally say: 'And, as true as God shall grant me all good things, Doctor, I sat beside Salomon Rothschild and he treated me quite as his equal - quite famillionairely.'

Heymans and Lipps used this joke (which is admittedly an excellent and most amusing one) to illustrate their view that the comic effect of jokes is derived from 'bewilderment and illumination' (see above). We, however, will leave that question on one side and ask another: 'What is it that makes Hirsch-Hyacinth's remark into a joke?' There can be only two possible answers: either the thought expressed in the sentence possesses in itself the character of being a joke or the joke resides in the expression which the thought has been given in the sentence. In whichever of these directions the character of being a joke may lie, we will pursue it further and try to lay hands on it.

A thought can in general be expressed in various linguistic forms - in various words, that is - which can represent it with equal aptness. Hirsch-Hyacinth's remark presents his thought in a particular form of expression and, as it seems to us, a specially odd form and not the one which is most easily intelligible. Let us try to express the same thought as accurately as possible in other words. Lipps has already done so, and in that way has to some extent explained the poet's intention. He writes (1898, 87): 'Heine, as we understand it, means to say that his reception was on familiar terms - of the not uncommon kind, which does not as a rule gain in agreeableness from having a flavour of millionairedom about it.' We shall not be altering the sense of this if we give it another shape which perhaps fits better into Hirsch-Hyacinth's speech: 'Rothschild treated me quite as his equal, quite familiarly that is, so far as a millionaire can.' 'A rich man's condescension', we should add, 'always involves something not quite pleasant for whoever experiences it.'¹

¹ We shall return to this same joke later on; and we shall then have occasion to make a correction in the translation of it given by Lipps which our own version has taken as its starting-point. This, however, will not affect the discussion that follows here.

Whether, now, we keep to the one or the other of the two equally valid texts of the thought, we can see that the question we asked ourselves is already decided. In this example the character of being a joke does not reside in the thought. What Heine has put into Hirsch-Hyacinth's mouth is a correct and acute observation, an observation of unmistakable bitterness, which is understandable in a poor man faced by such great wealth; but we should not venture to describe it as in the nature of a joke. If anyone is unable in considering the translation to get away from his recollection of the shape given to the thought by the poet, and thus feels that nevertheless the thought in itself is also in the nature of a joke, we can point to a sure criterion of the joking character having been lost in the translation. Hirsch-Hyacinth's remark made us laugh aloud, whereas its accurate translation by Lipps or our own version of it, though it may please us and make us reflect, cannot possibly raise a laugh.

But if what makes our example a joke is not anything that resides in its thought, we must look for it in the form, in the wording in which it is expressed. We have only to study the peculiarity of its form of expression to grasp what may be termed the verbal or expressive technique of this joke, something which must stand in an intimate relation with the essence of the joke, since, if it is replaced by something else, the character and effect of the joke disappear. Moreover, in attributing so much importance to the verbal form of jokes we are in complete agreement with the authorities. Thus Fischer (1889, 72) writes: 'It is in the first place its sheer *form* that makes a judgement into a joke, and we are reminded of a saying of Jean Paul's which, in a single aphorism, explains and exemplifies this precise characteristic of jokes - "Such is the victorious power of sheer position, whether among warriors or words."'

In what, then, does the 'technique' of this joke consist? What has happened to the thought, as expressed, for instance, in our version, in order to turn it into a joke that made us laugh so heartily? Two things - as we learn by comparing our version with the poet's text. First, a considerable *abbreviation* has occurred. In order to express fully the thought contained in the joke, we were obliged to add to the words 'R. treated me quite as his equal, quite familiarly' a postscript which, reduced to its shortest terms, ran 'that is, so far as a millionaire can'. And even so we felt the need for a further explanatory sentence.¹ The poet puts it far more shortly: 'R. treated me quite as his equal - quite famillionairely.' In the joke, the whole limitation added by the second sentence to the first, which reports the familiar treatment, has disappeared.

But not quite without leaving a substitute from which we can reconstruct it. For a second change has also been made. The word '*familiär* [familiarly]' in the unjoking expression of the thought has been transformed in the text of the joke into '*famillionär* [famillionairly]'; and there can be no doubt that it is precisely on this verbal structure that the joke's character as a joke and its power to cause a laugh depend. The newly constructed word coincides in its earlier portion with the '*familiär*' of the first sentence, and in its final syllables with the '*Millionär*' of the second sentence. It stands, as it were, for the '*Millionär*' portion of the second sentence and thus for the *whole* second sentence, and so puts us in a position to infer the second sentence that has been omitted in the text of the joke. It can be described as a 'composite structure' made up of the two components '*familiär*' and '*Millionär*', and it is tempting to give a diagrammatic picture of the way in which it is derived from those two words:²

F A M I L I	Ä R
<u> M I L I O N</u>	Ä R
F A M I L I O N	Ä R

¹ This is equally true of Lipps's translation.

² The two words are printed one in Roman and the other in Italic type, and the syllables common to them both are printed in thick type. The second 'l', which is scarcely pronounced, could of course be left out of account. It seems probable that the fact of the two words having several syllables in common offered the joke-technique the occasion for constructing the composite word.

The process which has converted the thought into a joke can then be represented in the following manner, which may at first sight seem fantastic, but nevertheless produces precisely the outcome that is really before us:

'R. treated me quite *familiär*,
that is, so far as a *Millionär* can.'

Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word '*Millionär*', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it - '*familiär*'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated:

'R. treated me quite *famili on är*.'
/ \
(*mili*) (*är*)

If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed - that is, the joke-technique - in this instance might be described as 'condensation accompanied by the formation of a substitute'; and in the present example the formation of the substitute consists in the making of a 'composite word'. This composite word '*famillionär*', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter compelling effect - the mechanism of which, however, is not made in any way clearer by our discovery of the joke-technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes.

Our expectation that the technique of jokes cannot be a matter of indifference from the point of view of discovering their essence leads us at once to enquire whether there are other examples of jokes constructed like Heine's '*famillionär*'. There are not very many of them, but nevertheless enough to make up a small group which are characterized by the formation of composite words. Heine himself has derived a second joke from the word '*Millionär*' - copying from himself, as it were. In Chapter XIV of his '*Ideen*' he speaks of a '*Millionarr*', which is an obvious combination of '*Millionär*' and '*Narr*'¹ and, just as in the first example, brings out a suppressed subsidiary thought.

Here are some other examples I have come upon. - There is a certain fountain [*Brunnen*] in Berlin, the erection of which brought the Chief Burgomaster Forckenbeck into much disfavour. The Berliners call it the '*Forckenbecken*', and there is certainly a joke in this description, even though it was necessary to replace the word '*Brunnen*' by its obsolete equivalent '*Becken*' in order to combine it into a whole with the name of the Burgomaster. - The voice of Europe once made the cruel joke of changing a potentate's name from Leopold to Cleopold, on account of the relations he had at one time with a lady with the first name of Cleo. This undoubted product of condensation keeps alive an annoying allusion at the cost of a single letter. - Proper names in general fall easy victims to this kind of treatment by the joke-technique. There were in Vienna two brothers named Salinger, one of whom was a *Börsensensal*. This provided a handle for calling him 'Sensalinger', while his brother, to distinguish him, was given the unflattering name of 'Scheusalinger'² This was convenient, and certainly a joke; I cannot say whether it was justified. But jokes do not as a rule enquire much into that.

¹ [The German for 'fool'.]

² ['*Scheusal*' means 'monstrous creature'.]

I have been told the following condensation joke. A young man who had hitherto led a gay life abroad paid a call, after a considerable absence, on a friend living here. The latter was surprised to see an *Ehering* [wedding-ring] on his visitor's hand, 'What?' he exclaimed, 'are you married?' 'Yes', was the reply, '*Trauring* but true.'¹ The joke is an excellent one. The word '*Trauring*' combines both components: '*Ehering*' changed into '*Trauring*' and the sentence '*traurig, aber wahr* [sad but true]'. The effect of the joke is not interfered with by the fact that here the composite word is not, like '*famillionär*', an unintelligible and otherwise non-existent structure, but one which coincides entirely with one of the two elements represented.

In the course of conversation I myself once unintentionally provided the material for a joke that is once again quite analogous to '*famillionär*'. I was talking to a lady about the great services that had been rendered by a man of science who I considered had been unjustly neglected. 'Why,' she said, 'the man deserves a monument.' 'Perhaps he will get one some day,' I replied, 'but *momentan* he has very little success.' '*Monument*' and '*momentan*' are opposites. The lady proceeded to unite them: 'Well, let us wish him a *monumentan*² success.'

¹ ['*Traurig*' would have meant 'sad'. '*Trauring*' is a synonym for '*Ehering*.']

² [A non-existing word. '*Monumental*' (as in English) would have been expected.]

I owe a few examples in foreign languages, which show the same mechanism of condensation as our '*famillionär*', to an excellent discussion of the same subject in English by A. A. Brill (1911).

The English author De Quincey, Brill tells us, somewhere remarked that old people are inclined to fall into their 'anecdoteage'. This word is a fusion of the partly overlapping words

and ANECDOTE
DOTAGE.

In an anonymous short story Brill once found the Christmas season described as 'the alcoholidays' - a similar fusing of

and ALCOHOL
HOLIDAYS.

After Flaubert had published his celebrated novel *Salammbô*, the scene of which is laid in ancient Carthage, Sainte-Beuve laughed at it, on account of its elaboration of detail, as being 'Carthaginoiserie';

CARTHAGINOIS
CHINOISERIE.

But the best example of a joke of this group originated from one of the leading men in Austria, who, after important scientific and public work, now fills one of the highest offices in the State. I have ventured to make use of the jokes which are ascribed to him, and all of which in fact bear the same impress, as material for these researches,¹ above all because it would have been hard to find any better.

Herr N.'s attention was drawn one day to the figure of a writer who had become well-known from a series of undeniably boring essays which he had contributed to a Vienna daily paper. All of these essays dealt with small episodes in the relations of the first Napoleon with Austria. The author had red hair. As soon as Herr N. heard his name mentioned he asked: 'Is not that the *roter Fadian*² that runs through the story of the Napoleonids?'

¹ Have I the right to do so? At least I have not obtained my knowledge of these jokes through an indiscretion. They are generally known in this city (Vienna) and are to be found in everyone's mouth. A number of them have been given publicity by Eduard Hanslick in the *Neue Freie Presse* and in his autobiography. As regards the others, I must offer my apologies for any possible distortions, which, in the case of oral tradition, are scarcely to be avoided.

² ['*Roter*' means 'red', 'scarlet'. '*Fadian*' means 'dull fellow'. The termination '-ian' is occasionally added to an adjective, giving the somewhat contemptuous sense of 'fellow'. Thus '*grob*' means 'coarse', '*Grobian*' means 'coarse fellow'; '*dumm*' means 'stupid', '*Dummian*' means 'stupid fellow'. The adjective '*fade*' or '*fad*' means (like its French equivalent) 'insipid', 'dull'. Finally, '*Faden*' means 'thread'.]

In order to discover the technique of this joke, we must apply to it the process of reduction which gets rid of the joke by changing the mode of expression and instead introducing the original complete meaning, which can be inferred with certainty from a good joke. Herr N.'s joke about the '*roter Fadian*' proceeds from two components - a depreciatory judgement upon the writer and a recollection of the famous simile with which Goethe introduces the extracts 'From Ottilie's Diary' in the *Wahlverwandtschaften*.¹ The ill-tempered criticism may have run: 'So this is the person who is for ever and ever writing nothing but boring stories about Napoleon in Austria!' Now this remark is not in the least a joke. Nor is Goethe's pretty analogy a joke, and it is certainly not calculated to make us laugh. It is only when the two are brought into connection with each other and submitted to the peculiar process of condensation and fusion that a joke emerges - and a joke of the first order.²

¹ 'We hear of a peculiar practice in the English Navy. Every rope in the king's fleet, from the strongest to the weakest, is woven in such a way that a *roter Faden* [scarlet thread] runs through its whole length. It cannot be extracted without undoing the whole rope, and it proves that even the smallest piece is crown property. In just the same way a thread of affection and dependence runs through Ottilie's diary, binding it all together and characterizing the whole of it.' Goethe, *Sophienausgabe*, 20, 212.)

² I need hardly point out how little this observation, which can invariably be made, fits in with the assertion that a joke is a playful judgement.

The linking of the disparaging judgement upon the boring historian with the pretty analogy in the *Wahlverwandtschaften* must have taken place (for reasons which I cannot yet make intelligible) in a less simple manner than in many similar cases. I shall try to represent what was probably the actual course of events by the following construction. First, the element of the constant recurrence of the same theme in the stories may have awoken a faint recollection in Herr N. of the familiar passage in the *Wahlverwandtschaften*, which is as a rule wrongly quoted: 'it runs like a *roter Faden* [scarlet thread].' The '*roter Faden*' of the analogy now exercised a modifying influence of the expression of the first sentence, as a result of the chance circumstance that the person insulted was also *rot* [red] - that is to say had red hair. It may then have run: 'So it is that red person who writes the boring stories about Napoleon!' And now the process began which brought about the condensation of the two pieces. Under its pressure, which had found its first fulcrum in the sameness of the element '*rot*', the 'boring' was assimilated to the '*Faden* [thread]' and was changed into '*fad* [dull]'; after this the two components were able to fuse together into the actual text of the joke, in which, in this case, the quotation has an almost greater share than the derogatory judgement, which was undoubtedly present alone to begin with.

'So it is that *red* person who writes this *fade* stuff about N[apoleon].
The *red* *Faden* that runs through everything.'

'Is not that the *red Fadian* that runs through the story of the N[apoleonids]?'

In a later chapter I shall add a justification, but also a correction, to this account, when I come to analyse this joke from points of view other than purely formal ones. But whatever else about it may be in doubt, there can be no question that a condensation has taken place. The result of the condensation is, on the one hand, once again a considerable abbreviation; but on the other hand, instead of the formation of a striking composite word, there is an interpenetration of the constituents of the two components. It is true that '*roter Faden*' would be capable of existing as a mere term of abuse; but in our instance it is certainly a product of condensation.

If at this point a reader should become indignant at a method of approach which threatens to ruin his enjoyment of jokes without being able to throw any light on the source of that enjoyment, I would beg him to be patient for the moment. At present we are only dealing with the technique of jokes; and the investigation even of this promises results, if we pursue it sufficiently far.

The analysis of the last example has prepared us to find that, if we meet with the process of condensation in still other examples, the substitute for what is suppressed may be not a composite structure, but some other alteration of the form of expression. We can learn what this other form of substitute may be from another of Herr N.'s jokes.

'I drove with him *tête-à-bête*.' Nothing can be easier than the reduction of this joke. Clearly it can only mean: 'I drove with X *tête-à-tête*, and X is a stupid ass.'

Neither of these sentences is a joke. They could be put together: 'I drove with that stupid ass X *tête-à-tête*', and that is not a joke either. The joke only arises if the 'stupid ass' is left out, and, as a substitute for it, the 't' in one '*tête*' is turned into a 'b'. With this slight modification the suppressed 'ass' has nevertheless once more found expression. The technique of this group of jokes can be described as 'condensation accompanied by slight modification', and it may be suspected that the slighter the modification the better will be the joke.

The technique of another joke is similar, though not without its complication. In the course of a conversation about someone in whom there was much to praise, but much to find fault with, Herr N. remarked: 'Yes, vanity is one of his four Achilles heels.'¹ In this case the slight modification consists in the fact that, instead of the *one* Achilles heel which the hero himself must have possessed, *four* are here in question. Four heels - but only an ass has four heels. Thus the two thoughts that are condensed in the joke ran: 'Apart from his vanity, Y is an eminent man; all the same I don't like him - he's an ass rather than a man.'²

¹ [Footnote added 1912:] It seems that this joke was applied earlier by Heine to Alfred de Musset.

² One of the complications in the technique of this example lies in the fact that the modification by which the omitted insult is replaced must be described as an *allusion* to the latter, since it only leads to it by a process of inference. For another factor that complicates the technique here, see below.

I happened to hear another similar, but much simpler, joke *in statu nascendi* in a family circle. Of two brothers at school, one was an excellent and the other a most indifferent scholar. Now it happened once that the exemplary boy too came to grief at school; and their mother referred to this while expressing her concern that it might mean the beginning of a lasting deterioration. The boy who had hitherto been overshadowed by his brother readily grasped the opportunity. 'Yes', he said, 'Karl's going backwards on all fours.'

The modification here consists in a short addition to the assurance that he too was of the opinion that the other boy was going backwards. But this modification represented and replaced a passionate plea on his own behalf: 'You mustn't think he's so much cleverer than I am simply because he's more successful at school. After all he's only a stupid ass - that's to say, much stupider than I am.'

Another, very well-known joke of Herr N.'s offers a neat example of condensation with slight modification. He remarked of a personage in public life: 'he has a great future behind him.' The man to whom this joke referred was comparatively young, and he had seemed destined by his birth, education and personal qualities to succeed in the future to the leadership of a great political party and to enter the government at its head. But times changed; the party became inadmissible as a government, and it could be foreseen that the man who had been predestined to be its leader would come to nothing as well. The shortest reduced version by which this joke could be replaced would run: 'The man has had a great future before him, but he has it no longer.' Instead of the 'had' and the second clause, there was merely the small change made in the principal clause of replacing 'before' by its contrary, 'behind'.¹

¹ There is another factor operating in the technique of this joke which I reserve for later discussion. It concerns the actual nature of the modification (representation by the opposite or by something absurd). There is nothing to prevent the joke-technique from simultaneously employing several methods; but these we can only get to know one by one.

Herr N. made use of almost the same modification in the case of a gentleman who became Minister for Agriculture with the sole qualification of being himself a farmer. Public opinion had occasion to recognize that he was the least gifted holder of the office that there had ever been. When he had resigned his office and retired to his farming interests, Herr N. said of him, 'Like Cincinnatus, he has gone back to his place before the plough.'

The Roman, however, who had also been called away to office from the plough, returned to his place *behind* the plough. What went *before* the plough, both then and to-day, was only - an ox.¹

Karl Kraus was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by '*Orienterpresszug*'.² There is no doubt that this word combines two others: '*Orientexpresszug* [Orient Express]' and '*Erpressung* [blackmail]'. Owing to the context, the element '*Erpressung*' emerges only as a modification of the '*Orientexpresszug*' - a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.

This series of examples could easily be further increased; but I do not think we require any fresh instances to enable us to grasp clearly the characteristics of the technique in this second group - condensation with modification. If we compare the second group with the first, whose technique consisted in condensation with the formation of composite words, we shall easily see that the difference between them is not an essential one and that the transitions between them are fluid. Both the formation of composite words and modification can be subsumed under the concept of the formation of substitutes; and, if we care to, we can also describe the formation of a composite word as a modification of the basic word by a second element.

¹ ['*Ochs*' in German has much the same meaning as 'ass' in English.]

² [A non-existent word.]

But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (*The Interpretation of Dreams*) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the *manifest*, and often strange, *content of the dream* with the *latent*, but perfectly logical, *dream-thoughts* from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

The first thing that we want to learn is whether the process of condensation with substitute-formation is to be discovered in every joke, and can therefore be regarded as a universal characteristic of the technique of jokes.

Here I recall a joke which has remained in my memory owing to the special circumstances in which I heard it. One of the great teachers of my young days, whom we thought incapable of appreciating a joke and from whom we had never heard a joke of his own, came into the Institute one day laughing, and, more readily than usual, explained to us what it was that had caused his cheerful mood. 'I have just read an excellent joke', he said. 'A young man was introduced into a Paris *salon*, who was a relative of the great Jean-Jacques Rousseau and bore his name. Moreover he was red-haired. But he behaved so awkwardly that the hostess remarked critically to the gentleman who had introduced him: "Vous m'avez fait connaître un jeune homme *roux* et *sot*, mais non pas un *Rousseau*.'"¹ And he laughed again.

By the nomenclature of the authorities this would be classed as a '*Klangwitz*',² and one of an inferior sort, with a play upon a proper name - not unlike the joke, for instance, in the Capuchin monk's sermon in *Wallensteins Lager*, which, as is well known, is modelled on the style of Abraham a Santa Clara:

Lässt sich nennen den *Wallenstein*,
ja freilich ist er uns *allen* ein *Stein*
des Anstosses und Ärgernisses.³

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. 'You had raised my expectations about a relative of Jean-Jacques Rousseau - perhaps a spiritual relative - and here he is: a red-haired silly young man, a *roux et sot*.' It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words

ROSSEAU

ROUX SOT

It thus proved that condensation with substitute-formation has no share in the production of this joke.

¹ ['You have made me acquainted with a young man who is *roux* (red-haired) and *sot* (silly), but not a Rousseau.' '*Roux-sot*' would be pronounced exactly like '*Rousseau*'.]

² ['Sound-joke.']

³ [Literally: 'He gets himself called Wallenstein, and indeed he is for *allen* (all) of us a *Stein* (stone) of offence and trouble.'] - Nevertheless, as a result of another factor, this joke deserves to be more highly thought of. But this can only be indicated later on.

What besides? Fresh attempts at reduction can teach me that the joke remains resistant until the name 'Rousseau' is replaced by another. If, for instance, I put 'Racine' instead of it, the lady's criticism, which remains just as possible as before, loses every trace of being a joke. I now know where I have to look for the technique of this joke, though I may still hesitate over formulating it. I will try this: the technique of the joke lies in the fact that one and the same word - the name - appears in it *used in two ways*, once as a whole, and again cut up into its separate syllables like a charade.

I can bring up a few examples which have an identical technique.

An Italian lady is said to have revenged herself for a tactless remark of the first Napoleon's with a joke having this same technique of the double use of a word. At a court ball, he said to her, pointing to her fellow countrymen: 'Tutti gli Italiani danzano si male.' To which she made the quick repartee: 'Non tutti, ma buona parte.'¹ (Brill, 1911.)

Once when the *Antigone* was produced in Berlin, the critics complained that the production was lacking in the proper character of antiquity. Berlin wit made the criticism its own in the following words: '*Antik? Oh, nee.*'² (Vischer, 1846-57, 1, 429, and Fischer, 1889.)

An analogous dividing-up joke is at home in medical circles. If one enquires from a youthful patient whether he has ever had anything to do with masturbation, the answer is sure to be: 'O na, nie!'³

¹ ['All Italians dance so badly!' 'Not all, but *buona parte* (a good part)' - the original, Italian version of Napoleon's surname.]

² ['Antique? Oh, no.' The words, in Berlin dialect, approximate in pronunciation to 'Antigone'.]

³ ['Oh, no, never!' '*Onanie* (onanism)' is the common German word for 'masturbation'.]

In all three of these examples, which should suffice for this species, we see the same joke-technique: in each of them a name is used twice, once as a whole and again divided up into its separate syllables, which, when they are thus separated, give another sense.¹

The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly-discovered technique can scarcely be limited to this one method. There are a number of possible ways - how many it is as yet quite impossible to guess - in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it.

¹ The goodness of these jokes depends on the fact that another technical method of a far higher order is simultaneously brought into use (see below). - At this point I may also draw attention to a connection between jokes and riddles. The philosopher Brentano composed a kind of riddle in which a small number of syllables had to be guessed which when they were put together into words gave a different sense according as they were grouped in one way or another. For instance: '. . . liess mich das Platanenblatt ahnen' ['the plane-tree leaf (*Platanenblatt*) led me to think (*ahnen*)', where '*Platanen*' and '*blatt ahnen*' sound almost the same]. Or: 'wie du dem Inder hast verschrieben, in der Hast verschrieben' ['when you wrote a prescription for the Indian, in your haste you made a slip of the pen', where '*Inder hast* (have to the Indian)' and '*in der hast* (in your haste)' sound the same.]

The syllables to be guessed were inserted into the appropriate place in the sentence under the disguise of the repeated sound 'dal'. [Thus the English example would be stated: 'he said he would daldaldal daldaldal.'] A colleague of the philosopher's took a witty revenge on him when he heard of the elderly man's engagement. He asked: 'Daldaldal daldaldal?' - 'Brentano brennt-a-no?' ['Brentano - does he still burn?']

What is the difference between these daldal riddles and the jokes in the text above? In the former the technique is given as a precondition and the wording has to be guessed; while in the jokes the wording is given and the technique is disguised.

In the first place, one can take the same verbal material and merely make some alteration in its *arrangement*. The slighter the alteration - the more one has the impression of something different being said in the same words - the better is the joke technically.

'Mr. and Mrs. X live in fairly grand style. Some people think that the husband has earned a lot and so has been able to lay by a bit [*sich etwas zurückgelegt*]; others again think that the wife has lain back a bit [*sich etwas zurückgelegt*] and so has been able to earn a lot.'¹

A really diabolically ingenious joke! And achieved with such an economy of means! 'Earned a lot - lay by a bit [*sich etwas zurückgelegt*]; lain back a bit [*sich etwas zurückgelegt*] - earned a lot.' It is merely the inversion of these two phrases that distinguishes what is said about the husband from what is hinted about the wife. Here again, by the way, this is not the whole technique of the joke.²

A wide field of play lies open to the technique of jokes if we extend the 'multiple use of the same material' to cover cases in which the word (or words) in which the joke resides may occur once unaltered but the second time with a slight modification. Here, for instance, is another of Herr N.'s jokes:

He heard a gentleman who was himself born a Jew make a spiteful remark about the Jewish character. 'Herr Hofrat', he said, 'your antesemitism was well-known to me; your anti-semitism is new to me.'

Here only a single letter is altered, whose modification could scarcely be noticed in careless speech. The example reminds us of Herr N.'s other modification jokes (on p. 1631 ff.), but the difference is that here there is no condensation; everything that has to be said is said in the joke itself: 'I know that earlier you were yourself a Jew; so I am surprised that *you* should speak ill of Jews.'

¹ Daniel Spitzer, 1912, 1, 280.

² [Footnote added 1912:] This is also true of the excellent joke reported by Brill from Oliver Wendell Holmes: 'Put not your trust in money, but put your money in trust.' Here there is promise of an antithesis but it does not materialize. The second part of the sentence cancels the antithesis. Incidentally, this is a good instance of the untranslatability of jokes with this technique.

An admirable example of a modification joke of this kind is the well-known cry: '*Traduttore - Traditore!*'¹ The similarity, amounting almost to identity, of the two words represents most impressively the necessity which forces a translator into crimes against his original.²

The variety of possible slight modifications in such jokes is so great that none of them exactly resembles another.

Here is a joke that is said to have been made during an examination in jurisprudence. The candidate had to translate a passage in the Corpus Juris: "'Labeo ait" . . . I fall, says he.' 'You fail, say I', replied the examiner, and the examination was at an end. Anyone who mistakes the name of the great jurist for a verbal form, and moreover one wrongly recalled, no doubt deserves nothing better. But the technique of the joke lies in the fact that almost the same words which proved the ignorance of the candidate were used to pronounce his punishment by the examiner. The joke is, moreover, an example of 'ready repartee', the technique of which, as we shall see, does not differ greatly from what we are illustrating here.

Words are a plastic material with which one can do all kinds of things. There are words which, when used in certain connections, have lost their original full meaning, but which regain it in other connections. A joke of Lichtenberg's carefully singles out circumstances in which the watered-down words are bound to regain their full meaning:

"How are you getting along?"³ the blind man asked the lame man. "As you see", the lame man replied to the blind man.'

There are, too, words in German that can be taken, according as they are 'full' or 'empty', in a different sense, and, indeed, in more than one. For there can be two different derivatives from the same stem, one of which has developed into a word with a full meaning and the other into a watered-down final syllable or suffix, both of which, however, are pronounced exactly the same. The identity of sound between a full word and a watered-down syllable may also be a chance one. In both cases the joke-technique can take advantage of the conditions thus prevailing in the linguistic material.

¹ ['Translator - traitor!']

² [*Footnote added 1912:*] Brill quotes a quite analogous modification joke: *Amantes amentes* (lovers are fools).

³ ['*Wie geht's?*' Literally, 'how do you walk?']

A joke, for instance, which is attributed to Schleiermacher, is of importance to us as being an almost pure example of these technical methods: '*Eifersucht* [jealousy] is a *Leidenschaft* [passion] which *mit Eifer sucht* [with eagerness seeks] what *Leiden schafft* [causes pain].'

This is undeniably in the nature of a joke, though not particularly effective as one. A quantity of factors are absent here which might mislead us in analysing other jokes so long as we examined each of those factors separately. The thought expressed in the wording is worthless; the definition it gives of jealousy is in any case thoroughly unsatisfactory. There is not a trace of 'sense in nonsense', of 'hidden meaning' or of 'bewilderment and illumination'. No efforts will reveal a 'contrast of ideas': a contrast between the words and what they mean can be found only with great difficulty. There is no sign of abbreviation; on the contrary, the wording gives an impression of prolixity. And yet it is a joke, and even a very perfect one. At the same time, its only striking characteristic is the one in the absence of which the joke disappears: the fact that here the same words are put to multiple uses. We can then choose whether to include this joke in the sub-class of those in which words are used first as a whole and then divided up (e.g. Rousseau or Antigone) or in the other sub-class in which the multiplicity is produced by the full or the watered-down meaning of the verbal constituents. Apart from this, only one other factor deserves notice from the point of view of the technique of jokes. We find here an unusual state of things established: a kind of 'unification' has taken place, since '*Eifersucht* [jealousy]' is defined by means of its own name - by means of itself, as it were. This, as we shall see, is also a technique of jokes. These two factors, therefore, must in themselves be sufficient to give a remark the character of a joke.

If now we enter still further into the variety of forms of the 'multiple use' of the same word, we suddenly notice that we have before us examples of 'double meaning' or 'play upon words' - forms which have long been generally known and recognized as a technique of jokes. Why have we taken the trouble to discover afresh what we might have gathered from the most superficial essay on jokes? To begin with, we can only plead in our own justification that we have nevertheless brought out another aspect of the same phenomenon of linguistic expression. What is supposed by the authorities to show the character of jokes as a kind of 'play' has been classified by us under the heading of 'multiple use'.

The further cases of multiple use, which can also be brought together under the title of 'double meaning' as a new, third group, can easily be divided into sub-classes, which, it is true, cannot be separated from one another by essential distinctions any more than can the third group as a whole from the second. We find:

(a) Cases of the double meaning of a name and of a *thing* denoted by it. For instance: 'Discharge thyself of our company, Pistol!' (Shakespeare.)

'More *Hof* than *Freiung*' said a witty Viennese about a number of pretty girls who had been admired for many years but had never found a husband. 'Hof' and 'Freiung' are the names of two neighbouring squares in the centre of Vienna.

'Vile Macbeth does not rule here in Hamburg: the ruler here is *Banko*.' (Heine.)

Where the name cannot be used (we should perhaps say 'misused') unaltered, a double meaning can be got out of it by one of the slight modifications we are familiar with:

'Why', it was asked, in times that are now past, 'have the French rejected *Lohengrin*?' 'On Elsa's (Elsass [Alsace]) account.'

(b) Double meaning arising from the literal and metaphorical meanings of a word. This is one of the most fertile sources for the technique of jokes. I will quote only one example:

A medical friend well-known for his jokes once said to Arthur Schnitzler the dramatist: 'I'm not surprised that you've become a great writer. After all your father held a mirror up to his contemporaries.' The mirror which was handled by the dramatist's father, the famous Dr. Schnitzler, was the laryngoscope. A well-known remark of Hamlet's tells us that the purpose of a play, and so also of the dramatist who creates it, is 'to hold, as 'twere, the mirror up to nature; to show virtue her own feature, scorn her own image, and the very age and body of the time his form and pressure.' (III, 2.)

(c) Double meaning proper, or play upon words. This may be described as the ideal case of 'multiple use'. Here no violence is done to the word; it is not cut up into its separate syllables, it does not need to be subjected to any modification, it does not have to be transferred from the sphere it belongs to (the sphere of proper names, for instance) to another one. Exactly as it is and as it stands in the sentence, it is able, thanks to certain favourable circumstances, to express two different meanings.

Examples of this are at our disposal in plenty:

One of Napoleon III's first acts when he assumed power was to seize the property of the House of Orleans. This excellent play upon words was current at the time: 'C'est le premier vol de l'aigle.' ['It is the eagle's first *vol*.'] '*Vol*' means 'flight' but also 'theft'. (Quoted by Fischer, 1889.)

Louis XV wanted to test the wit of one of his courtiers, of whose talent he had been told. At the first opportunity he commanded the gentleman to make a joke of which he, the king, should be the '*sujet*'. The courtier at once made the clever reply: 'Le roi n'est pas sujet.' ['The King is not a subject.']

A doctor, as he came away from a lady's bedside, said to her husband with a shake of his head: 'I don't like her looks.' 'I've not liked her looks for a long time', the husband hastened to agree.

The doctor was of course referring to the lady's condition; but he expressed his anxiety about the patient in words which the husband could interpret as a confirmation of his own marital aversion.

Heine said of a satirical comedy: 'This satire would not have been so biting if its author had had more to bite.' This joke is more an example of metaphorical and literal double meaning than of a play upon words proper. But what is to be gained by drawing a sharp distinction here?

Another good example of play upon words is told by the authorities (Heymans and Lipps) in a form which makes it unintelligible. Not long ago I came upon the correct version and setting of the anecdote in a collection of jokes which has not proved of much use apart from this.¹

'One day Saphir and Rothschild met each other. After they had chatted for a little while, Saphir said: "Listen, Rothschild, my funds have got low, you might lend me a hundred ducats." "Oh well!", said Rothschild, "that'll suit me all right - but only on condition that you make a joke." "That'll suit me all right too", replied Saphir. "Good. Then come to my office tomorrow." Saphir appeared punctually. "Ah!", said Rothschild, when he saw him come in, "*Sie kommen um Ihre 100 Dukaten*." "No", answered Saphir, "*Sie kommen um Ihre 100 Dukaten* because I shan't dream of paying you back before the Day of Judgement."²

¹ Hermann, 1904.

² [*'Sie kommen um . . .'* may mean equally 'You are coming about' or 'You are losing'.] - "Saphir", so Heymans tells us, "was asked by a rich creditor whom he had come to visit: '*Sie kommen wohl um die 300 Gulden?*' [No doubt you've come about the 300 florins?]' and he replied: '*Nein, Sie kommen um die 300 Gulden* [No, you're going to lose the 300 florins].' In giving this answer he was expressing his meaning in a perfectly correct and by no means unusual form." That is in fact the case. Saphir's answer, *considered in itself*, is in perfect order. We understand, too, what he means to say - namely that he has no intention of paying his debt. But Saphir makes use of the same words that had previously been used by his creditor. We therefore cannot avoid also taking them in the sense in which they had been used by the latter. And in that case Saphir's answer no longer has any meaning whatever. The creditor is not "coming" at all. Nor can he be coming "about the 300 florins" - that is, he cannot be coming to bring 300 florins. Moreover, as a creditor, it is not his business to bring but to demand. Since Saphir's words are in this way recognized as being at once sense and nonsense, a comic situation arises.' (Lipps, 1898, 97.)

The version which I have given in full in the text above for the sake of clarity shows that the technique of the joke is far simpler than Lipps supposes. Saphir does not come to *bring* the 300 florins but to *fetch* them from the rich man. Accordingly the discussions of 'sense and nonsense' in this joke become irrelevant.

'What do these statues *vorstellen* [represent or put forward]?' asked a stranger to Berlin of a native Berliner, looking at a row of monuments in a public square. 'Oh, well,' was the reply: 'either their right leg or their left leg.'

'At this moment I cannot recall all the students' names, and of the professors there are some who still have no name at all.' (Heine, *Harzreise*.)

We shall be giving ourselves practice, perhaps, in diagnostic differentiation if at this point we insert another well-known joke about professors. 'The distinction between Professors Ordinary [*ordentlich*] and Professors Extraordinary [*ausserordentlich*] is that the ordinary ones do nothing extraordinary and the extraordinary ones do nothing properly [*ordentlich*].' This, of course, is a play on the two meanings of the words '*ordentlich*' and '*ausserordentlich*': viz. on the one hand 'inside' and 'outside' the '*ordo* (the Establishment)' and on the other hand 'efficient' and 'outstanding'. But the conformity between this joke and some others we have already met reminds us that here the 'multiple use' is far more noticeable than the 'double meaning'. All through the sentence we hear nothing but a constantly recurring '*ordentlich*', sometimes in that form and sometimes modified in a negative sense. (Cf. p. 1639.) Moreover, the feat is again achieved here of defining a concept by means of its own wording (cf. the example of '*Eifersucht*', p. 1640), or, more precisely, of defining (even if only negatively) two correlative concepts by means of one another, which produces an ingenious interlacement. Finally, the aspect of 'unification' can also be stressed here - the eliciting of a more intimate connection between the elements of the statement than one would have had a right to expect from their nature.

'The beadle¹ Sch[äfer] greeted me quite as a colleague, for he too is a writer, and has often mentioned me in his half-yearly writings; and apart from that, he has often *cited*² me, and if he did not find me at home he was always kind enough to write the *citation* in chalk on my study door.' (Heine, *Harzreise*.)

¹ [A university officer (at Göttingen) in charge of undergraduate discipline.]

² [For breaches of discipline.]

Daniel Spitzer, in *Wiener Spaziergänge*, produced a laconic biographical description, which is certainly also a good joke, of a social type which flourished at the time of the outbreak of speculation: 'Iron front - iron cash-box - Iron Crown.' (This last was an order which carried noble rank with it.) A striking example of 'unification' - everything, as it were, made of iron! The various, but not very markedly contrasting, meanings of the epithet 'iron' make these 'multiple uses' possible.

Another example of a play upon words may make the transition to a fresh sub-species of the technique of double meaning easier. The joking medical colleague already mentioned above (on p. 1640) was responsible for this joke at the time of the Dreyfus case: 'This girl reminds me of Dreyfus. The army doesn't believe in her innocence.'

The word 'innocence', on the double meaning of which the joke is constructed, has in the one context its usual meaning, with 'fault' or 'crime' as its opposite; but in the other context it has a *sexual* meaning, of which the opposite is 'sexual experience'. Now there are a very large number of similar examples of double meaning, in all of which the effect of the joke depends quite specially on the sexual meaning. For this group we may reserve the name of '*double entendre* [*Zweideutigkeit*]'.

An excellent example of a *double entendre* of this kind is Spitzer's joke which has already been recorded on p. 1639: 'Some people think that the husband has earned a lot and so has been able to lay by a bit [*sich etwas zurückgelegt*]; others again think that the wife has lain back a bit [*sich etwas zurückgelegt*] and so has been able to earn a lot.'

But if we compare this example of double meaning accompanied by *double entendre* with other examples, a distinction becomes evident which is not without its interest from the point of view of technique. In the 'innocence' joke, the one meaning of the word was just as obvious as the other; it would really be hard to decide whether its sexual or non-sexual meaning was the more usual and familiar. But it is otherwise with Spitzer's example. In this the commonplace meaning of the words '*sich etwas zurückgelegt*' is by far the more prominent, whereas their sexual meaning is, as it were, covered and hidden and might even escape the notice of an unsuspecting person altogether. By way of a sharp contrast let us take another example of double meaning, in which no attempt is made at thus concealing the sexual meaning: for instance, Heine's description of the character of a complaisant lady: 'She could *abschlagen*¹ nothing except her own water.' This sounds like a piece of obscenity and hardly gives the impression of a joke.² This peculiarity, however, where in a case of double meaning the two meanings are not equally obvious, can also occur in jokes with no sexual reference - whether because one meaning is more usual than the other or because it is brought to the front by a connection with the other parts of the sentence. (Cf., for instance, 'C'est le premier vol de l'aigle'.) I propose to describe all these as 'double meaning with an allusion.'

¹ ['To refuse'; vulgarly 'to urinate'.]

² Cf. on this Fischer (1889, 86). He gives the name of '*Zweideutigkeit*', which I have applied differently in the text, to jokes with a double meaning in which the two meanings are not equally prominent but in which one lies behind the other. Nomenclature of this kind is a matter of convention; linguistic usage has arrived at no firm decision.

We have already made the acquaintance of such a large number of different joke-techniques that I fear there is some danger of losing our grasp of them. Let us therefore try to summarize them:

I. Condensation:

- (a) with formation of composite word,
- (b) with modification.

II. Multiple use of the same material:

- (c) as a whole and in parts,
- (d) in a different order,
- (e) with slight modification,
- (f) of the same words full and empty.

III. Double meaning:

- (g) Meaning as a name and as a thing,
- (h) metaphorical and literal meanings,
- (i) double meaning proper (play upon words),
- (j) *double entendre*,
- (k) double meaning with an allusion.

This variety and number of techniques has a confusing effect. It might make us feel annoyed at having devoted ourselves to a consideration of the technical methods of jokes, and might make us suspect that after all we have exaggerated their importance as a means for discovering the essential nature of jokes. If only this convenient suspicion were not contradicted by the one incontestable fact that the joke invariably disappears as soon as we eliminate the operation of these techniques from its form of expression! So, in spite of everything, we are led to look for the unity in this multiplicity. It ought to be possible to bring all these techniques under a single heading. As we have already said, it is not difficult to unite the second and third groups. Double meaning (play upon words) is indeed only the ideal case of the multiple use of the same material. Of these the latter is evidently the more inclusive concept. The examples of dividing up, of re-arrangement of the same material and of multiple use with slight modification (*c*, *d* and *e*) might - though only with some difficulty - be brought under the concept of double meaning. But what is there in common between the technique of the first group (condensation with substitute formation) and that of the two others (multiple use of the same material)?

Well, something very simple and obvious, I should have thought. The multiple use of the same material is, after all, only a special case of condensation; play upon words is nothing other than a condensation *without* substitute-formation; condensation remains the wider category. All these techniques are dominated by a tendency to compression, or rather to saving. It all seems to be a question of economy. In Hamlet's words: 'Thrift, thrift, Horatio!'

Let us test this economy on the different examples. 'C'est le premier vol de l'aigle.' It is the eagle's first flight. Yes, but it is a thieving flight. Luckily for the existence of this joke, '*vol*' means not only 'flight' but 'theft' as well. Has no condensation and economy been made? Most certainly. There has been a saving of the whole of the second thought and it has been dropped without leaving a substitute. The double meaning of the word '*vol*' has made such a substitute unnecessary; or it would be equally true to say that the word '*vol*' contains the substitute for the suppressed thought without any addition of change having to be made to the first one. That is the advantage of a double meaning.

Another example: 'Iron front - iron cash-box - Iron Crown'. What an extraordinary saving compared with an expression of the same thought in which 'iron' finds no place: 'With the help of the necessary boldness and lack of conscience it is not difficult to amass a large fortune, and for such services a title will of course be a suitable reward.'

Condensation, and therefore economy, is indeed quite unmistakably present in these examples. But it should be present in *every* example. Where is the economy hidden in such jokes as 'Rousseau - *roux et soif*' or 'Antigone - *antik? oh nee*', in which we first noticed the absence of condensation and which were our principal motive for putting forward the technique of the repeated use of the same material? It is true that here we should not find that condensation would meet the case; but if instead of it we take the more inclusive concept of economy, we can manage without difficulty. It is easy to point out what we save in the case of Rousseau, Antigone, etc. We save having to express a criticism or give shape to a judgement; both are already there in the name itself. In the example of '*Leidenschaft - Eifersucht* [passion-jealousy]' we save ourselves the trouble of laboriously constructing a definition: '*Eifersucht, Leidenschaft - Eifer sucht* [eagerness seeks]', '*Leidenschaft*' [causes pain]. We have only to add the linking words and there we have our definition ready made. The case is similar in all the other examples that have so far been analysed. Where there is least saving, as in Saphir's play upon words '*Sie kommen um Ihre 100 Dukaten*', there is at any rate a saving of the necessity for framing a new wording for the reply; the wording of the question is sufficient for the answer. The saving is not much, but in it the joke lies. The multiple use of the same words for question and answer is certainly an 'economy'. Like Hamlet's view of the rapid sequence of his father's death and his mother's marriage:

The funeral baked-meats
Did coldly furnish forth the marriage tables.

But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

We can evade these doubts provisionally if we transpose them to another place. Have we really already discovered all the kinds of joke-technique? It will certainly be more prudent to collect fresh examples and subject them to analysis.

We have in fact not yet considered a large - perhaps the most numerous - group of jokes, influenced, perhaps, by the contempt with which they are regarded. They are the kind which are generally known as 'Kalauer' ('*calembourgs*') ['puns'] and which pass as the lowest form of verbal joke, probably because they are the 'cheapest' - can be made with the least trouble. And they do in fact make the least demand on the technique of expression, just as the play upon words proper makes the highest. While in the latter the two meanings should find their expression in identically the same word, which on that account is usually said only once, it is enough for a pun if the two words expressing the two meanings recall each other by some vague similarity, whether they have a general similarity of structure or a rhyming assonance, or whether they share the same first few letters, and so on. A quantity of examples like this of what are not very appropriately described as '*Klangwitze* [sound-jokes]' occur in the Capuchin monk's sermon in *Wallensteins Lager*.

Kümmert sich mehr um den *Krug* als den *Krieg*,
Wetzt lieber den *Schnabel* als den *Sabel*

.....

Frisst den *Ochsen* lieber als den *Oxenstirn*,

.....

Der *Rheinstrom* ist worden zu einem *Peinstrom*,
Die *Klöster* sind ausgenommene *Nester*,
Die *Bistümer* sind verwandelt in *Wüsttümer*.

.....

Und alle die gesegneten deutschen *Länder*
Sind verkehrt worden in *Elender*.¹

¹ [Literally:-

He cares more for the *bottle* than the *battle*,
Would rather whet his *nose* than his *sword*

.....

Would rather eat *oxen* than *Oxenstirn*,

.....

The *Rhine stream* has become a *pain stream*,
The *monastries* are robbed *bird's nests*,
The *bishoprics* are transformed into *desertrics*.

.....

And all the blessed German *lands*
Have been turned into *wretched places*.]

Jokes are particularly apt to change one of the vowels in a word. Thus Hevesi (1888, 87) writes of an anti-Imperial Italian poet who was nevertheless obliged later to eulogize a German emperor in hexameters: 'Since he could not exterminate the *Cäsaren* [Caesars], he at least eliminated the *Cäsuren* [caesuras].

Out of the profusion of puns at our disposal, it will perhaps be of special interest to bring up a really bad example, of which Heine is guilty. Having for a long time represented himself to his lady as an 'Indian prince', he throws off the mask and confesses: 'Madame, I have deceived you . . . I have no more ever been in *Kalkutta* [Calcutta] than the *Kalkuttenbraten* [roast Calcutta fowl] that I ate for luncheon yesterday.' The mistake in this joke clearly lies in the fact that the two similar words in it are not merely similar but actually identical. The bird which he had eaten roast is so called, because it comes, or is supposed to come, from the same Calcutta.

Fischer (1889, 78) has devoted much attention to these forms of joke, and tries to distinguish them sharply from 'play upon words'. 'A pun is a bad play upon words, since it plays upon the word not as a word but as a sound.' The play upon words, however, 'passes from the sound of the word to the word 'itself.' On the other hand, he classes such jokes as *famillionär*, *Antigone* (*antik? oh nee*), etc. among the 'sound jokes'. I see no necessity for following him in this. In a play upon words, in our view, the word is also only a sound-image, to which one meaning or another is attached. But here, too, linguistic usage makes no sharp distinctions; and if it treats 'puns' with contempt and 'play upon words' with a certain respect, these judgements of value seem to be determined by considerations other than technical ones. It is worth while paying attention to the kind of jokes that are told one as 'puns'. There are some people who, when they are in high spirits, can for considerable periods of time, answer every remark addressed to them with a pun. One of my friends, who is a model of discretion where his serious achievements in science are concerned, is apt to boast of this ability. When on one occasion he was holding the company breathless in this way and admiration was expressed for his staying power: 'Yes', he said 'I am lying here *auf der Ka-Lauer*.'² And when he was finally begged to stop, he agreed to on condition that he was appointed '*Poeta Ka-laureatus*'. Both of these, however, are excellent jokes of condensation with formation of composite words. ('I am lying here *auf der Lauer* for making *Kalauer* [puns].')

In any case we can already gather from the disputes about the delimitation of puns and play upon words that the former will not be able to help us to discover a completely new joke technique. If, in the case of puns, we give up the claim for the use of the *same* material in more than one sense, nevertheless the accent falls on rediscovering what is familiar, on the correspondence between the two words that make up the pun; and consequently puns merely form a sub-species of the group which reaches its peak in the play upon words proper.

¹ 'Ideen', Chapter V.

² ['*Kalauer*' = 'pun'. '*Auf der Lauer*' = 'on the look-out'.]

But there really are jokes whose technique resists almost any attempt to connect it with the groups that have so far been considered.

'The story is told of Heine that he was in a Paris *salon* one evening conversing with the dramatist Soulié, when there came into the room one of those financial kings of Paris whom people compare with Midas - and not merely on account of their wealth. He was soon surrounded by a crowd who treated him with the greatest deference. "Look there!" Soulié remarked to Heine, "Look at the way the nineteenth century is worshipping the Golden Calf!" With a glance at the object of so much admiration, Heine replied, as though by way of correction: "Oh, he must be older than that by now!"' (Fischer, 1889, 82-3.)

Where shall we look for the technique of this excellent joke? In a play upon words, thinks Fischer: 'Thus, for instance, the words "Golden Calf" can mean both Mammon and idolatry. In the one case the gold is the main thing and in the other the statue of the animal; it may also serve to characterize, in not precisely flattering terms, someone who has a great deal of money and very little sense.' (Loc. cit.) If we make the experiment of removing the expression 'Golden Calf', we certainly get rid of the joke at the same time. We make Soulié say: 'Look there! Look at the way the people are crowding round the stupid fellow simply because he's rich!' This is no longer a joke and Heine's reply is also made impossible.

But we must recall that what we are concerned with is not Soulié's simile - which is a possible joke - but Heine's reply, which is certainly a much better one. That being so, we have no right to touch the phrase about the Golden Calf: it remains as the precondition of Heine's *mot* and our reduction must be directed only to the latter. If we expand the words 'Oh, he must be older than that by now!' we can only replace them by something like: 'Oh, he's not a calf any longer; he's a full-grown ox!' Thus what was necessary for Heine's joke was that he should no longer take the 'Golden Calf' in a metaphorical but in a personal sense and should apply it to the rich man himself. It may even be that this double meaning was already present in Soulié's remark.

But just a moment! It looks now as though this reduction has not done away with Heine's joke completely, but on the contrary has left its essence untouched. The position now is that Soulié says: 'Look there! Look at the way the nineteenth century is worshipping the Golden Calf!' and Heine replies: 'Oh, he's not a calf any longer; he's an ox already!' And in this reduced version it is still a joke. But no other reduction of Heine's *mot* is possible.

It is a pity that this fine example involves such complicated technical conditions. We can arrive at no clarification of it. So we will leave it and look for another one in which we seem to detect an internal kinship with its predecessor.

It is one of the 'bath jokes' which treat of the Galician Jews' aversion to baths. For we do not insist upon a patent of nobility from our examples. We make no enquiries about their origin but only about their efficiency - whether they are capable of making us laugh and whether they deserve our theoretical interest. And both these two requirements are best fulfilled precisely by Jewish jokes.

'Two Jews met in the neighbourhood of the bath-house. "Have you taken a bath?" asked one of them. "What?" asked the other in return, "is there one missing?"'

If one laughs at a joke really heartily, one is not in precisely the best mood for investigating its technique. Hence some difficulties arise over making one's way into these analyses. 'It was a comical misunderstanding', we are inclined to say. Yes but what is the technique of the joke? Clearly the use of the word 'take' in two meanings. For one of the speakers 'take' was the colourless auxiliary; for the other it was the verb with its sense unwatered down. Thus it is a case of the same word used 'full' and 'empty' (Group II (f)). If we replace the expression 'taken a bath' by the equivalent and simpler 'bathed', the joke vanishes. The reply no longer fits. Thus the joke is once again attached to the form of expression 'taken a bath'.

That is so. But nevertheless it seems as though in this case too the reduction has been applied at the wrong point. The joke lies not in the question but in the answer - the second question: 'What? is there one missing?' And this answer cannot be robbed of being a joke by any extension or modification, so long as its sense is not interfered with. We have an impression, too, that in the second Jew's reply the disregarding of the bath is more important than the misunderstanding of the word 'take'. But here once more we cannot see our way clearly, and we will look for a third example.

It is again a Jewish joke; but this time it is only the setting that is Jewish, the core belongs to humanity in general. No doubt this example too has its unwanted complications, but fortunately they are not the same ones that have so far prevented us from seeing clearly.

'An impoverished individual borrowed 25 florins from a prosperous acquaintance, with many asseverations of his necessitous circumstances. The very same day his benefactor met him again in a restaurant with a plate of salmon mayonnaise in front of him. The benefactor reproached him: "What? You borrow money from me and then order yourself salmon mayonnaise? Is *that* what you've used my money for?" "I don't understand you", replied the object of the attack; "if I haven't any money I *can't* eat salmon mayonnaise, and if I have some money I *mustn't* eat salmon mayonnaise. Well, then, when *am* I to eat salmon mayonnaise?"'

Here at last no more trace of a double meaning is to be found. Nor can the repetition of 'salmon mayonnaise' contain the joke's technique, for it is not 'multiple use' of the same material but a real repetition of identical material called for by the subject-matter of the anecdote. We may for a time be quite baffled by this analysis and may even think of taking refuge in denying that the anecdote - though it made us laugh - possesses the character of a joke.

What more is there deserving of comment in the impoverished person's reply? That it has been very markedly given the form of a logical argument. But quite unjustifiably, for the reply is in fact illogical. The man defends himself for having spent the money lent to him on a delicacy and asks, with an appearance of reason, *when* he is to eat salmon. But that is not the correct answer. His benefactor is not reproaching him with treating himself to salmon precisely on the day on which he borrowed the money; he is reminding him that in his circumstances he has no right to think of such delicacies *at all*. The impoverished *bon vivant* disregards this only possible meaning of the reproach, and answers another question as though he had misunderstood the reproach.

Can it be that the technique of this joke lies precisely in this diverting of the reply from the meaning of the reproach? If so, a similar change of standpoint, a similar shifting of the psychical emphasis, may perhaps be traceable in the two earlier examples, which we felt were akin to this one.

And, lo and behold! this suggestion is an easy success and in fact reveals the technique of those examples. Soulié pointed out to Heine that society in the nineteenth century worshipped the 'Golden Calf' just as did the Jews in the Wilderness. An appropriate answer by Heine might have been 'Yes, such is human nature; thousands of years have made no change in it' or something similar by way of assent. But Heine diverted his answer from the thought suggested to him and made no reply to it at all. He made use of the double meaning of which the phrase 'Golden Calf' is capable to branch off along a side-track. He caught hold of one component of the phrase, 'Calf', and replied, as though the emphasis in Soulié's remark had been upon it: 'Oh, he's not a calf any longer' . . . etc.¹

¹ Heine's answer combines two joke-techniques: a diversion combined with an allusion. He did not say straight out: 'He's an ox.'

The diversion in the bath-joke is even plainer. This example calls for a graphic presentation:

The first Jew asks: 'Have you taken a *bath*?' The emphasis is on the element 'bath'.

The second replies as though the question had been: 'Have you *taken* a bath?'

This shifting of the emphasis is only made possible by the wording 'taken a bath'. If it had run 'have you bathed?' no displacement would have been possible. The non-joking answer would then have been: 'Bathed? What d'you mean? I don't know what that is.' But the technique of the joke lies in the displacement of the accent from 'bath' to 'taken'.¹

Let us go back to the 'Salmon Mayonnaise', since it is the most straightforward example. What is new in it deserves our attention in various directions. First we must give a name to the technique brought to light in it. I propose to describe it as 'displacement', since its essence lies in the diversion of the train of thought, the displacement of the psychical emphasis on to a topic other than the opening one. Our next task is to enquire into the relation between the technique of displacement and the form of expression of the joke. Our example ('Salmon Mayonnaise') shows us that a displacement joke is to a high degree independent of verbal expression. It depends not on words but on the train of thought. No replacement of the words will enable us to get rid of it so long as the sense of the answer is retained. Reduction is only possible if we change the train of thought and make the gourmet reply directly to the reproach which he has evaded in the version represented in the joke. The reduced version would then run: 'I can't deny myself what tastes good to me, and it's a matter of indifference to me where I get the money from to pay for it. There you have the explanation of why I'm eating salmon mayonnaise on the very day you've lent me the money.' But that would not be a joke; it would be a piece of cynicism.

¹ The word 'take [*nehmen*]' is very well adapted to form a basis for play upon words owing to the variety of ways in which it can be used. I will give a plain example, as a contrast to the displacement jokes reported above: 'A well-known stock-exchange speculator and bank-director was walking with a friend along the Ringstrasse. As they went past a cafe he remarked: "Let's go inside and take something!" His friend held him back: "But, Herr Hofrat, the place is full of people!"'

It is instructive to compare this joke with another that is very close to it in meaning:

'A man who had taken to drink supported himself by tutoring in a small town. His vice gradually became known, however, and as a result he lost most of his pupils. A friend was commissioned to urge him to mend his ways. "Look, you could get the best tutoring in the town if you would give up drinking. So do give it up!" "Who do you think you are?" was the indignant reply. "I do tutoring so that I can drink. Am I to give up drinking so that I can get tutoring?"'

This joke gives the same appearance of being logical that we saw in the 'Salmon Mayonnaise'; but it is not a displacement joke. The reply was a direct one. The cynicism which was concealed in the former joke is openly admitted in this one: 'Drinking is the most important thing for me.' Actually the technique of this joke is extremely scanty and cannot explain its effectiveness. It consists simply in the rearrangement of the same material or, more precisely, in the reversal of the relation of means and ends between drinking and doing or getting tutoring. As soon as my reduction ceases to emphasize this factor in its form of expression, the joke fades; for instance: 'What a senseless suggestion! The important thing for me is the drinking, not the tutoring. After all, tutoring is only a means to enable me to go on drinking.' So the joke did in fact depend on its form of expression.

In the bath-joke the dependence of the joke on its wording ('Have you taken a bath?') is unmistakable, and a change in it involves the disappearance of the joke. For in this case the technique is a more complicated one - a combination of double meaning (sub-species *f*) and displacement. The wording of the question admits a double meaning, and the joke is produced by the answer disregarding the meaning intended by the questioner and catching on to the subsidiary meaning. We are accordingly in a position to find a reduction which allows the double meaning of the wording to persist and yet destroys the joke; we can do this merely by undoing the displacement:

'Have you taken a bath?' - 'What do you think I've taken? A bath? What's that?' But this is no longer a joke, but a malicious or facetious exaggeration.

A precisely similar part is played by the double meaning in Heine's joke about the 'Golden Calf'. It enables the answer to make a diversion from the suggested train of thought (which is effected in the 'Salmon Mayonnaise' joke without any such assistance from the wording). In the reduction Souliés remark and Heine's reply would perhaps run: 'The way in which the people here are crowding round the man simply because he's rich reminds one vividly of the worship of the Golden Calf.' And Heine: 'That he should be honoured in this way because of his wealth doesn't strike me as the worst of it. In what you say you're not putting enough stress on the fact that because of his wealth people forgive him his stupidity.' In this way the double meaning would be retained but the displacement joke would be destroyed.

But at this point we must be prepared to meet an objection which will assert that these fine distinctions are seeking to tear apart what belongs together. Does not every double meaning give occasion for a displacement - for a diversion of the train of thought from one meaning to the other? And are we prepared, then, to allow 'double meaning' and 'displacement' to be set up as representatives of two quite different types of joke-technique? Well, it is true that this relation between double meaning and displacement does exist, but it has nothing to do with our distinguishing the different joke-techniques. In the case of double meaning a joke contains nothing other than a word capable of multiple interpretation, which allows the hearer to find the transition from one thought to another - a transition which, stretching a point, might be equated with a displacement. In the case of a displacement joke, however, the joke itself contains a train of thought in which a displacement of this kind has been accomplished. Here the displacement is part of the work which has created the joke; it is not part of the work necessary for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it tangibly before our eyes in our attempts at reduction. But there is one merit which we will not deny to this objection. It draws our attention to the necessity of not confusing the psychical processes involved in the *construction* of the joke (the 'joke-work') with the psychical processes involved in *taking in* the joke (the work of understanding). Our present enquiry is only concerned with the former.¹

¹ For the latter, see later chapters of this book. - A few further words of explanation are perhaps not unnecessary here. Displacement habitually takes place between a remark and a reply which pursues the train of thought in a direction other than that in which it was started by the original remark. The justification for distinguishing displacement from double meaning is most convincingly shown by the examples in which the two are combined - where, that is, the wording of the remark admits of a double meaning which is not intended by the speaker, but which points the way for the reply to make a displacement. (See the examples.)

Are there other examples of the displacement technique? They are not easy to find. A straightforward instance is afforded by the following joke, which moreover is not characterized by the appearance of logic which was so much overstressed in our model case:

'A horse-dealer was recommending a saddle-horse to a customer. "If you take this horse and get on it at four in the morning you'll be at Pressburg by half-past six." - "What should I be doing in Pressburg at half-past six in the morning?"'

Here the displacement leaps to the eye. The dealer obviously mentions the early hour of arriving at the provincial town simply in order to demonstrate the horse's capacity by an example. The customer disregards the animal's capacity, which he does not question, and merely enters into the data of the example that has been chosen. The reduction of this joke is accordingly easy to give.

Greater difficulties are presented by another example the technique of which is most obscure, but which can nevertheless be solved as double meaning combined with displacement. The joke describes the prevarication of a '*Schadchen*' (a Jewish marriage-broker), and is thus one of a group with which we shall often be concerned.

'The *Schadchen* had assured the suitor that the girl's father was no longer living. After the betrothal it emerged that the father was still alive and was serving a prison sentence. The suitor protested to the *Schadchen*, who replied: "Well, what did I tell you? You surely don't call that living?"'

The double meaning lies in the word 'living', and the displacement consists in the *Schadchen* shifting the meaning of the word from its ordinary sense, as a contrast to 'dead', to the sense which it has in the phrase 'that's not living'. In doing so he explains his former pronouncement retrospectively as having had a double meaning, though any such multiple meaning was decidedly remote in this particular case. So far the technique would seem similar to that in the 'Golden Calf' joke and the bath-joke. But here there is another factor to be considered which by its prominence interferes with our understanding of the technique. It might be described as a 'characterizing' joke: it seeks by an example to illustrate a marriage-broker's characteristic mixture of mendacious impudence and readiness of repartee. We shall find that this is only the outer shell, the façade, of the joke; its meaning - that is to say, its purpose - is something different. And we must postpone the attempt at a reduction of it.¹

After these complicated examples, which have been so hard to analyse, it will be with satisfaction that we are able to turn once more to an example which can be recognized as a perfectly straightforward and transparent sample of a displacement joke:

'A *Schnorrer* [someone who is reluctant to part with his own money] approached a wealthy baron with a request for the grant of some assistance for his journey to Ostend. The doctors, he said, had recommended him sea-bathing to restore his health. "Very well", said the rich man, "I'll give you something towards it. But must you go precisely to Ostend, which is the most expensive of all sea-bathing resorts?" - "Herr Baron", was the reproachful reply, "I consider nothing too expensive for my health." This is no doubt a correct point of view, but not correct for a petitioner. The answer is given from the point of view of a rich man. The *Schnorrer* behaves as though it was his own money that he was to sacrifice for his health, as though the money and the health were the concern of the same person.

¹ See Chapter III below.

Let us start once more from that highly instructive example 'Salmon Mayonnaise'. It, too, presented us with a façade, in which a striking parade of logical thinking was exhibited; and we learnt from analysing it that this logic was used to conceal a piece of faulty reasoning - namely, a displacement of the train of thought. This may serve to remind us, if only by means of a contrasting connection, of other jokes which, quite the other way, undisguisedly exhibit a piece of nonsense or stupidity. We shall be curious to learn what may be the technique of such jokes.

I will begin with the most forcible and at the same time the plainest example of the whole group. Once again it is a Jewish joke:

'Itzig had been declared fit for service in the artillery. He was clearly an intelligent lad, but intractable and without any interest in the service. One of his superior officers, who was friendly disposed to him, took him on one side and said to him: "Itzig, you're no use to us. I'll give you a piece of advice: buy yourself a cannon and make yourself independent!"'

This advice, which may raise a hearty laugh, is obvious nonsense. Cannons are not to be bought and an individual cannot make himself independent as a military unit - set himself up in business, as it were. But it is impossible to doubt for a moment that the advice is not mere nonsense but joking nonsense - an excellent joke. How then is the nonsense turned into a joke?

Not much reflection is needed. We can infer from the authorities' comments indicated above in the introduction that there is sense behind joking nonsense such as this, and that it is this sense that makes the nonsense into a joke. The sense in our example is easy to find. The officer who gives Artilleryman Itzig this nonsensical advice is only making himself out stupid to show Itzig how stupidly he himself is behaving. He is copying Itzig: 'I'll give you some advice that's as stupid as you are.' He enters into Itzig's stupidity and makes it clear to him by taking it as the basis of a suggestion which would fit in with Itzig's wishes: if Itzig possessed a cannon of his own and carried out military duties on his own account, how useful his intelligence and ambition would be to him! In what good order he would keep his cannon and how familiar he would make himself with its mechanism so as to meet the competition of the other possessors of cannons!

I will interrupt the analysis of this example, to point out the same sense in nonsense in a shorter and simpler, though less glaring, case of a nonsensical joke:

'Never to be born would be the best thing for mortal men.' 'But', adds the philosophical comment in *Fliegende Blätter*, 'this happens to scarcely one person in a hundred thousand.'

This modern addition to an ancient saw is an evident piece of nonsense, made sillier by the ostensibly cautious 'scarcely'. But the addition is attached to the original statement as an indisputably correct limitation, and is thus able to open our eyes to the fact that this solemnly accepted piece of wisdom is itself not much better than a piece of nonsense. Anyone who is not born is not a mortal man at all, and there is no good and no best for him. Thus the nonsense in the joke serves to uncover and demonstrate another piece of nonsense, just as in the example of Artilleryman Itzig.

And here I can add a third instance, which, from its content, would scarcely deserve the lengthy description that it requires, but which once again exemplifies with special clarity the use of nonsense in a joke to demonstrate another piece of nonsense.

'A man who was obliged to go on a journey confided his daughter to a friend with the request that he should watch over her virtue during his absence. Some months later he returned, and found that she was pregnant. As was natural, he reproached his friend, who, however, seemed unable to explain the misfortune. "Well", asked the father at last, "where did she sleep?" - "In the room with my son." - "But how could you let her sleep in the same room as your son after I'd begged you so to look after her?" - "After all there was a screen between them. Your daughter's bed was on one side and my son's bed on the other, with the screen between them." - "And suppose he walked round the screen?" - "Yes, there is that", replied the other thoughtfully; "it might have happened like that."

We can arrive with the greatest ease at the reduction of this joke, whose qualities have otherwise little to recommend it. It would obviously run: 'You have no right to reproach me. How could you be so stupid as to leave your daughter in a house where she is bound to live in the constant company of a young man? How would it be possible for an outsider to answer for a girl's virtue in such circumstances?' Here, then, the friend's apparent stupidity is only a reflection of the father's stupidity. The reduction has disposed of the stupidity in the joke and at the same time of the joke itself. The element 'stupidity' itself has not been got rid of: it is to be found at another point in the context of the sentence after it has been reduced to its original meaning.

We can now attempt a reduction of the joke about the cannon. The officer should have said: 'Itzig, I know you're an intelligent man of business. But I assure you it is very stupid of you if you can't see that it is impossible to behave in the army in the same way as in business life, where each person acts for himself and against the others. In military life subordination and co-operation are the rule.'

The technique of the nonsensical jokes which we have so far considered really consists, therefore, in presenting something that is stupid and nonsensical, the sense of which lies in the revelation and demonstration of something else that is stupid and nonsensical.

Has this use of absurdity in joke technique always the same significance? Here is one more example which gives an affirmative reply:

'When on one occasion Phocion was applauded after making a speech, he turned to his friends and asked: "What have I said that's stupid, then?"'

The question sounds absurd. But we see its meaning at once: 'What have I said, then, that can have pleased these stupid people so much? I ought to feel ashamed of the applause. If what I said has pleased stupid people, it cannot itself have been very sensible.'

Other examples, however, can teach us that absurdity is very often used in joke-technique without serving the purpose of demonstrating another piece of nonsense:

'A well-known University teacher, who was in the habit of peppering his unattractive special subject with numerous jokes, was congratulated on the birth of his youngest child, who was granted to him when he had already reached an advanced age. "Yes", he replied to his well-wishers, "it is remarkable what human hands can accomplish." - This answer seems quite specially nonsensical and out of place. Children, after all, are regarded as a blessing of God, quite in contrast to human handiwork. But it soon occurs to us that after all the answer has a meaning and, at that, an obscene one. There is no question here of the happy father making himself out stupid in order to show that something or someone else is stupid. The apparently senseless answer makes a surprising, a bewildering impression on us, as the authorities would say. As we have seen they attribute the whole effect of jokes like this to an alternation between 'bewilderment and illumination'. We shall try later to form a judgement on this; for the moment we must be content to stress the fact that the technique of this joke lies in its presentation of something bewildering and nonsensical.

A joke of Lichtenberg's takes a quite special place among these 'stupid' jokes:

'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are.' To wonder about something that is in fact only the statement of an identity is undoubtedly a piece of stupidity. It reminds one of Michelet's exclamation¹ which was meant to be taken seriously, and which to the best of my recollection runs: 'How beautifully Nature has arranged it that as soon as a child comes into the world it finds a mother ready to take care of it!' Michelet's pronouncement is a real piece of stupidity, but Lichtenberg's is a joke which makes use of stupidity for some purpose and behind which something lies. But what? For the moment, we must admit, no answer can be given.

¹ *La Femme*

We have now already found from two groups of examples that the joke-work makes use of deviations from normal thinking - of displacement and absurdity - as technical methods for producing a joking form of expression. It is no doubt justifiable to expect that other kinds of faulty reasoning may find a similar use. And it is in fact possible to produce a few examples of the sort:

'A gentleman entered a pastry-cook's shop and ordered a cake; but he soon brought it back and asked for a glass of liqueur instead. He drank it and began to leave without having paid. The proprietor detained him. "What do you want?" asked the customer. - "You've not paid for the liqueur." - "But I gave you the cake in exchange for it." - "You didn't pay for that either." - "But I hadn't eaten it."

This anecdote too has an appearance of logic about it, which, as we already know, is a suitable façade for a piece of faulty reasoning. The mistake evidently lies in the crafty customer's constructing a connection which did not exist between the giving back of the cake and the taking of the liqueur in its place. The episode in fact fell into two processes, which were independent of each other so far as the vendor was concerned and were substitutes for each other only from the point of view of the purchaser's intention. First he took the cake and gave it back, and therefore owed nothing for it; then he took the liqueur, and for it he owed payment. We might say that the customer used the relation 'in exchange for' with a double meaning. But it would be more correct to say that by means of a double meaning he constructed a connection which was not in reality valid.¹

¹ [*Footnote added 1912:*] A similar nonsensical technique appears if a joke seeks to maintain a connection which seems to be excluded by the special conditions implied in its content. Such, for instance, is Lichtenberg's knife without a blade which has no handle. So, too, the joke repeated by Von Falke: 'Is this the place where the Duke of Wellington spoke those words?' - 'Yes, it is the place; but he never spoke the words.'

This is an opportunity for making a not unimportant admission. We are engaged in investigating the technique of jokes as shown in examples; and we should therefore be certain that the examples we have chosen are really genuine jokes. It is the case, however, that in a number of instances we are in doubt whether the particular example ought to be called a joke or not. We have no criterion at our disposal before our investigation has given us one. Linguistic usage is untrustworthy and itself needs to have its justification examined. In coming to our decision we can base ourselves on nothing but a certain 'feeling', which we may interpret as meaning that the decision is made in our judgement in accordance with particular criteria that are not yet accessible to our knowledge. In the case of our last example we must feel a doubt whether it should be represented as a joke, or perhaps as a 'sophistical' joke, or simply as a piece of sophistry. For the fact is that we do not yet know in what the characteristic of being a joke resides.

On the other hand, the next example, which exhibits a type of faulty reasoning that may be said to be complementary to the former instance, is an undoubted joke. It is once again a story of a marriage-broker:

'The *Schadchen* was defending the girl he had proposed against the young man's protests. "I don't care for the mother-in-law", said the latter. "She's a disagreeable, stupid person." - "But after all you're not marrying the mother-in-law. What you want is her daughter." - "Yes, but she's not young any longer, and she's not precisely a beauty." - "No matter. If she's neither young nor beautiful she'll be all the more faithful to you." - "And she hasn't much money." - "Who's talking about money? Are you marrying money then? After all it's a wife that you want." - "But she's got a hunchback too." - "Well, what *do* you want? Isn't she to have a single fault?"

What was really in question, then, was an unbeautiful girl, no longer young, with a scanty dowry and an unpleasant mother, who was moreover the victim of a serious deformity - not very inviting conditions for contracting a marriage. The marriage broker was able, in the case of each one of these defects, to point out how it would be possible to come to terms with it. He was then able to claim that the inexcusable hunchback was the single defect that every individual must be allowed to possess. Once more there is the appearance of logic which is characteristic of a piece of sophistry and which is intended to conceal the faulty reasoning. Clearly the girl had a number of defects - several that might be overlooked and one that it was impossible to disregard; she was unmarriageable. The broker behaved as though each separate defect was got rid of by his evasions, whereas in fact each one of them left a certain amount of depreciation behind which had to be added to the next one. He insisted on treating each defect in isolation and refused to add them up into a total.

The same omission is the core of another piece of sophistry which has been much laughed over, but whose right to be called a joke might be doubted:

'A. borrowed a copper kettle from B. and after he had returned it was sued by B. because the kettle now had a big hole in it which made it unusable. His defence was: "First, I never borrowed a kettle from B. at all; secondly, the kettle had a hole in it already when I got it from him; and thirdly, I gave him back the kettle undamaged.'" Each one of these defences is valid in itself, but taken together they exclude one another. A. was treating in isolation what had to be regarded as a connected whole, just as the marriage-broker treated the girl's defects. We might also say: 'A. has put an "and" where only an "either-or" is possible.'

We find another piece of sophistry in the following marriage broker story:

'The would-be bridegroom complained that the bride had one leg shorter than the other and limped. The *Schadchen* contradicted him: "You're wrong. Suppose you marry a woman with healthy, straight limbs! What do you gain from it? You never have a day's security that she won't fall down, break a leg and afterwards be lame all her life. And think of the suffering then, the agitation, and the doctor's bill! But if you take *this* one, that can't happen to you. Here you have a *fait accompli*.'

The appearance of logic is very thin in this case, and no one will be ready to prefer an already 'accomplished misfortune' to one that is merely a possibility. The fault in this train of thought can be more easily shown in another example - a story which I cannot entirely divest of its dialect:

'In the temple at Cracow the Great Rabbi N. was sitting and praying with his disciples. Suddenly he uttered a cry, and, in reply to his disciples' anxious enquiries, exclaimed: "At this very moment the Great Rabbi L. has died in Lemberg." The community put on mourning for the dead man. In the course of the next few days people arriving from Lemberg were asked how the Rabbi had died and what had been wrong with him; but they knew nothing about it, and had left him in the best of health. At last it was established with certainty that the Rabbi L. in Lemberg had not died at the moment at which the Rabbi N. had observed his death by telepathy, since he was still alive. A stranger took the opportunity of jeering at one of the Cracow Rabbi's disciples about this occurrence: "Your Rabbi made a great fool of himself that time, when he saw the Rabbi L. die in Lemberg. The man's alive to this day." "That makes no difference", replied the disciple. "Whatever you may say, the *Kück*¹ from Cracow to Lemberg was a magnificent one.'"

The faulty reasoning common to the last two examples is here undisguisedly admitted. The value of phantasy is exalted unduly in comparison with reality; a possibility is almost equated with an actual event. The distant look across the stretch of country separating Cracow and Lemberg would have been an impressive telepathic achievement if it had produced something that was true. But the disciple was not concerned with that. It might after all have possibly happened that the Rabbi in Lemberg had died at the moment at which the Cracow Rabbi announced his death; and the disciple displaced the emphasis from the condition subject to which the teacher's achievement deserved admiration on to an unconditional admiration of the achievement. '*In magnis rebus voluisse sat est*'² expresses a similar point of view. Just as in this example reality is disregarded in favour of possibility, so in the former one the marriage-broker suggests to the would-be bridegroom that the possibility of a woman being made lame by an accident should be regarded as something far more important than the question of whether she is really lame or not.

¹ [A Yiddish word] from the German '*gucken* [to look or peep]': 'look', 'distant look'.

² ['In great things it is enough to have wished.']

This group of 'sophistical' pieces of faulty reasoning is resembled by another interesting group in which the faulty reasoning can be described as 'automatic'. It may be due to no more than a whim of chance that all the examples that I shall bring forward of this new group are once more *Schadchen* stories:

'A *Schadchen* had brought an assistant with him to the discussion about the proposed bride, to bear out what he had to say. "She is straight as a pine-tree", said the *Schadchen*. - "As a pine-tree", repeated the echo. - "And she has eyes that ought to be seen!" - "What eyes she has!" confirmed the echo.- "And she is better educated than anyone!" - "What an education!" - "It's true there's one thing", admitted the broker, "she has a small hump." - "And *what* a hump!" the echo confirmed once more.' The other stories are analogous, but have more sense.

'The bridegroom was most disagreeably surprised when the bride was introduced to him, and drew the broker on one side and whispered his remonstrances: "Why have you brought me here?" he asked reproachfully. "She's ugly and old, she squints and has bad teeth and bleary eyes . . ." - "You needn't lower your voice", interrupted the broker, "she's deaf as well."

'The bridegroom was paying his first visit to the bride's house in the company of the broker, and while they were waiting in the *salon* for the family to appear, the broker drew attention to a cupboard with glass doors in which the finest set of silver plate was exhibited. "There! Look at that! You can see from these things how rich these people are." - "But", asked the suspicious young man, "mightn't it be possible that these fine things were only collected for the occasion - that they were borrowed to give an impression of wealth?" - "What an idea!" answered the broker protestingly. "Who do you think would lend these people anything?"'

The same thing happens in all three cases. A person who has reacted in the same way several times in succession repeats this mode of expression on the next occasion, when it is unsuitable and defeats his own intentions. He neglects to adapt himself to the needs of the situation, by giving way to the automatic action of habit. Thus, in the first story the assistant forgets that he was brought along in order to prejudice the would-be bridegroom in favour of the proposed bride. And since to begin with he has performed his task and underlined the bride's advantages by repeating each one as it is brought forward, he goes on to underline her timidly admitted hump, which he should have minimized. The broker in the second story is so much fascinated by the enumeration of the bride's defects and infirmities that he completes the list out of his own knowledge, though that was certainly not his business or purpose. In the third story, finally, he allows himself to be so much carried away by his eagerness to convince the young man of the family's wealth that, in order to establish one confirmatory point, he brings up something that is bound to upset all his efforts. In every case automatic action triumphs over the expedient modification of thought and expression.

This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called 'comic' as we had to produce them as 'jokes'. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction.) Are these stories perhaps only 'comic' and not 'jokes'? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?

We must keep to our view that the technique of this last group of jokes that we have examined lies in nothing else than in bringing forward 'faulty reasoning'. But we are obliged to admit that their examination has so far led us more into obscurity than understanding. Nevertheless we do not abandon our expectation that a more complete knowledge of the techniques of jokes will lead us to a result which can serve as a starting point for further discoveries.

The next examples of jokes, with which we shall pursue our enquiry, offer an easier task. Their technique, in particular, reminds us of what we already know.

First, here is a joke of Lichtenberg's:

'January is the month in which we offer our dear friends wishes, and the rest are the months in which they are not fulfilled.'

Since these jokes are to be described as refined rather than strong, and work by methods that are unobtrusive, we will begin by presenting a number of them in order to intensify their effect:

'Human life falls into two halves. In the first half we wish the second one would come; and in the second we wish the first one were back.'

'Experience consists in experiencing what we do not wish to experience.'

(Both these last two are from Fischer, 1889.)

These examples cannot fail to remind us of a group with which we have already dealt and which is distinguished by the 'multiple use of the same material'. The last example in particular will raise the question of why we did not include it in that group instead of introducing it here in a fresh connection. 'Experience' is once again described in its own terms, just as 'jealousy' was earlier (p. 1640). I should not be inclined to dispute this classification very seriously. But as regards the other two examples (which are of a similar nature), I think another factor is more striking and more important than the multiple use of the same words, in which in this case there is nothing that fringes on double meaning. I should like in particular to stress the fact that here new and unexpected unities are set up, relations of ideas to one another, definitions made mutually or by reference to a common third element. I should like to name this process 'unification'. It is clearly analogous to condensation by compression into the same words. Thus the two halves of human life are described by a mutual relation discovered to exist between them: in the first we wish the second would come and in the second we wish the first were back. Speaking more precisely, two very similar mutual relations have been chosen for representation. To the similarity of the relations there corresponds a similarity of the words, which may indeed remind us of the multiple use of the same material: 'wish . . . would come' - 'wish . . . back'. In Lichtenberg's joke January and the months contrasted with it are characterized by a (once again, modified) relation to a third element; these are the good wishes, which are received in the first month and not fulfilled in the remaining ones. Here the distinction from the multiple use of the same material (which approximates to double meaning) is very clear.¹

¹ In order to give a better description of 'unification' than the examples above allow of, I will make use of something I have already mentioned - namely the peculiar negative relation that holds between jokes and riddles, according to which the one conceals what the other exhibits. Many of the riddles with the production of which G. T. Fechner, the philosopher, passed his time when he was blind, are characterized by a high degree of unification, which lends them a special charm. Take, for instance, as a neat example, Riddle No. 203 (Dr. Mises' *Rätselbüchlein*, 4th edition, enlarged, N.D.):

Die beiden ersten finden ihre Ruhestätte
Im Paar der andern, und das Ganze macht ihr Bette.

[My two first (*Toten*, the dead) find their resting-place in my two last (*Gräber*, graves), and my whole (*Totengräber*, grave-digger) makes their bed.]

We are told nothing about the two pairs of syllables that have to be guessed except a relation that holds between them, and about the whole we are only told its relation to the first pair.

The following are two examples of description by relation to the same or a slightly modified third element:

Die erste Silb'hat Zähn' und Haare,
Die zweite Zähne in den Haaren,
Wer auf den Zähnen nicht hat Haare,
Vom Ganzen kaufe keine Waren. No. 170.

[The first syllable has teeth and hair (*Ross*, horse), the second has teeth in the hair (*Kamm*, comb). No one who has not hair on his teeth (i.e. who is not able to look after his interests) should buy goods from the whole (*Rosskamm*, horse-dealer).]

Die erste Silbe frisst,
Die andere Silbe isst,
Die dritte wird gefressen,
Das Ganze wird gegessen. No. 168.

Jokes and Their Relation To The Unconscious

[The first syllable gobbles (*Sau*, sow), the second syllable eats (*Er*, he), the third is gobbled (*Kraut*, weeds), the whole is eaten (*Sauerkraut*).]

The most perfect instance of unification is to be found in a riddle of Schleiermacher's, which cannot be denied the character of a joke:

Von der letzten umschlungen
Schwebt das vollendete Ganze
Zu den zwei ersten empor.

[Entwined by my last (*Strick*, rope), my completed whole (*Galgenstrick*, rogue) swings to the top of my two first (*Galgen*, gallows).]

The great majority of all such riddles lack unification. That is to say, the clue by which one syllable is to be guessed is quite independent of those that point to the second or third, as well as of the indication which is to lead to the separate discovery of the whole.

Here is a neat example of a unification joke which needs no explanation:

'The French poet J. B. Rousseau wrote an Ode to Posterity. Voltaire was not of opinion that the poem merited survival, and jokingly remarked: "This poem will not reach its destination.'" (Fischer, 1889.)

This last example draws attention to the fact that it is essentially unification that lies at the bottom of jokes that can be described as 'ready repartees'. For repartee consists in the defence going to meet the aggression, in 'turning the tables on someone' or 'paying someone back in his own coin' - that is, in establishing an unexpected unity between attack and counter-attack. For instance:

'An innkeeper had a whitlow on his finger and the baker said to him: "You must have got that by putting your finger in your beer." "It wasn't that", replied the innkeeper, "I got a piece of your bread under my nail."' (From Überhorst (1900, 2).)

'Serenissimus was making a tour through his provinces and noticed a man in the crowd who bore a striking resemblance to his own exalted person. He beckoned to him and asked: "Was your mother at one time in service in the Palace?"- "No, your Highness," was the reply, "but my father was."'

'Duke Charles of Württemberg happened on one of his rides to come upon a dyer who was engaged on his job. Pointing to the grey horse he was riding, the Duke called out: "Can you dye him blue?" "Yes, of course, your Highness," came the answer, "if he can stand boiling."'

In this excellent *tu quoque*, in which a nonsensical question is met by an equally impossible condition, there is another technical factor at work which would have been absent if the dyer had answered: 'No, your Highness. I'm afraid the horse wouldn't stand boiling.'

Unification has another, quite specially interesting technical instrument at its disposal: stringing things together with the conjunction 'and'. If things are strung together in this way it implies that they are connected: we cannot help understanding it so. For instance, when Heine, speaking of the city of Göttingen in the *Harzreise*, remarks: 'Speaking generally, the inhabitants of Göttingen are divided into students, professors, philistines and donkeys', we take this grouping in precisely the sense which Heine emphasizes in an addition to the sentence: 'and these four classes are anything but sharply divided.' Or, again, when he speaks of the school in which he had to put up with 'so much Latin, caning and Geography', this series, which is made even more transparent by the position of the 'caning' between the two educational subjects, tells us that the unmistakable view taken by the schoolboys of the caning certainly extended to Latin and Geography was well.

Among the examples given by Lipps of 'joking enumeration' ('co-ordination'), we find the following lines quoted as being closely akin to Heine's 'students, professors, philistines and donkeys':

Mit einer Gabel und mit Müh'
Zos ihn die Mutter aus der Brüh.

[With a fork and much to-do
His mother dragged him from the stew.]

It is as though (Lipps comments), the *Müh* [trouble, to-do] were an instrument like the fork. We have a feeling, however, that these lines, though they are very comic, are far from being a joke, while Heine's list undoubtedly is one. We may perhaps recall these examples later, when we need no longer evade the problem of the relation between the comic and jokes.

We observed in the example of the Duke and the dyer that it would remain a joke by unification if the dyer had replied: 'No, I'm afraid the horse wouldn't stand boiling.' But his actual reply was: 'Yes, your Highness, if he can stand boiling.' The replacement of the really appropriate 'no' by a 'yes' constitutes a new technical method of joking, the employment of which we will pursue in some other examples.

A joke similar to the one we have just mentioned (also quoted by Fischer) is simpler:

'Frederick the Great heard of a preacher in Silesia who had the reputation of being in contact with spirits. He sent for the man and received him with the question "You can conjure up spirits?" The reply was: "At your Majesty's command. But they don't come."' It is quite obvious here that the method used in the joke lay in nothing else than the replacing of the only possible answer 'no' by its opposite. In order to carry out the replacement, it was necessary to add a 'but' to the 'yes'; so that 'yes' and 'but' are equivalent in sense to 'no'.

This 'representation by the opposite', as we shall call it, serves the joke-work in various forms. In the next two examples it appears almost pure:

'This lady resembles the Venus of Milo in many respects: she, too, is extraordinarily old, like her she has no teeth, and there are white patches on the yellowish surface of her body.' (Heine.)

Here we have a representation of ugliness through resemblances to what is most beautiful. It is true that these resemblances can only exist in qualities that are expressed in terms with a double meaning or in unimportant details. This latter feature applies to our second example - 'The Great Spirit', by Lichtenberg:

'He united in himself the characteristics of the greatest men. He carried his head askew like Alexander; he always had to wear a *toupet* like Caesar; he could drink coffee like Leibnitz; and once he was properly settled in his armchair, he forgot eating and drinking like Newton, and had to be woken up like him; he wore his wig like Dr. Johnson, and he always left a breeches-button undone like Cervantes.'

Von Falke (1897, 271) brought home a particularly good example of representation by the opposite from a journey to Ireland, an example in which no use whatever is made of words with a double meaning. The scene was a wax-work show (as it might be, Madame Tussaud's). A guide was conducting a company of old and young visitors from figure to figure and commenting on them: 'This is the Duke of Wellington and his horse', he explained. Whereupon a young lady asked: 'Which is the Duke of Wellington and which is his horse?' 'Just as you like, my pretty child,' was the reply. 'You pays your money and you takes your choice.'

The reduction of this Irish joke would be: 'Shameless the things these wax-work people dare to offer the public! One can't distinguish between the horse and its rider! (Facetious exaggeration.) And that's what one pays one's money for!' This indignant exclamation is then dramatized, based on a small occurrence. In place of the public in general an individual lady appears and the figure of the rider is particularized: he must be the Duke of Wellington, who is so extremely popular in Ireland. But the shamelessness of the proprietor or guide, who takes money out of people's pockets and offers them no thing in return, is represented by the opposite - by a speech in which he boasts himself a conscientious man of business, who has nothing more closely at heart than regard for the rights which the public has acquired by its payment. And now we can see that the technique of this joke is not quite a simple one. In so far as it enables the swindler to insist on his conscientiousness it is a case of representation by the opposite; but in so far as it effects this on an occasion on which something quite different is demanded of him - so that he replies with business like respectability where what we expect of him is the identification of the figures - it is an instance of displacement. The technique of the joke lies in a combination of the two methods.

No great distance separates this example from a small group which might be described as 'overstatement' jokes. In these the 'yes' which would be in place in the reduction is replaced by a 'no', which, however, on account of its content, has the force of an intensified 'yes', and *vice versa*. A denial is a substitute for an overstated confirmation. Thus, for instance, in Lessing's epigram:¹

Die gute Galathee! Man sagt, sie schwärz' ihr Haar;
Da doch ihr Haar schon schwarz, als sie es kaufte, war.

[Good Galathea blacks her hair, 'tis thought;
And yet her hair was black when it was bought.]

Or Lichtenberg's malicious defence of philosophy:

'There are more things in heaven and earth than are dreamt of in your philosophy', said Prince Hamlet contemptuously. Lichtenberg knew that this condemnation is not nearly severe enough, for it does not take into account all the objections that can be made to philosophy. He therefore added what was missing: 'But there is much, too, in philosophy that is not to be found in heaven or earth.' His addition, it is true, emphasizes the way in which philosophy compensates us for the insufficiency for which Hamlet censures it. But this compensation implies another and still greater reproach.

Two Jewish jokes, though they are of a coarse type, are even clearer, since they are free from any trace of displacement:

'Two Jews were discussing baths. "I have a bath every year", said one of them, "whether I need one or not."'

It is obvious that this boastful insistence on his cleanliness only serves to convict him of uncleanness.

'A Jew noticed the remains of some food in another one's beard. "I can tell you what you had to eat yesterday." - "Well, tell me." - "Lentils, then." - "Wrong: the day before yesterday! "'

The following example is an excellent 'overstatement' joke, which can easily be traced back to representation by the opposite:

'The King condescended to visit a surgical clinic and came on the professor as he was carrying out the amputation of a leg. He accompanied all its stages with loud expressions of his royal satisfaction: "Bravo! bravo! my dear Professor!" When the operation was finished, the professor approached him and asked him with a deep bow: "Is it your Majesty's command that I should remove the other leg too?" '

¹ Modelled on one in the Greek Anthology.

The professor's thoughts during the royal applause could certainly not have been expressed unaltered: 'This makes it look as though I were taking off the poor fellows bad leg by royal command and only for the royal satisfaction. After all I really have other reasons for the operation.' But he then goes to the King and says: 'I have no reasons for carrying out an operation other than your Majesty's command. The applause you honoured me with has made me so happy that I only await your Majesty's orders to amputate the sound limb too.' In this way he succeeds in making himself understood by saying the opposite of what he thinks but must keep to himself. This opposite is an overstatement that cannot be believed.

As these examples show, representation by the opposite is an instrument of joke-technique that is used frequently and works powerfully. But there is something else that we should not overlook: namely that this technique is by no means peculiar to jokes. When Mark Antony, after he has made a long speech in the Forum and has reversed the emotional attitude of his audience round Caesar's corpse, finally exclaims once more:

'For Brutus is an honourable man . . .'

he knows that the people will now shout back to him the true sense of his words:

'They were traitors: honourable men!'

Or when *Simplicissimus* describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling', this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.

If representation by the opposite is one of the technical methods of jokes, we can expect that jokes may also make use of its contrary - representation by something *similar* or akin. A further pursuit of our enquiry will in fact show us that this is the technique of a fresh and particularly comprehensive group of conceptual jokes. We shall describe the peculiarity of this technique far more appropriately if, instead of representation by something 'akin', we say by something 'correlated' or 'connected'. We will take our start, in fact, with this latter characteristic and illustrate it at once by an example.

Here is an American anecdote: 'Two not particularly scrupulous business men had succeeded, by dint of a series of highly risky enterprises, in amassing a large fortune, and they were now making efforts to push their way into good society. One method, which struck them as a likely one, was to have their portraits painted by the most celebrated and highly paid artist in the city, whose pictures had an immense reputation. The precious canvases were shown for the first time at a large evening party, and the two hosts themselves led the most influential connoisseur and art critic up to the wall upon which the portraits were hanging side by side, to extract his admiring judgement on them. He studied the works for a long time, and then, shaking his head, as though there was something he had missed, pointed to the gap between the pictures and asked quietly: "But where's the Saviour?"' (I.e. 'I don't see the picture of the Saviour'.)

The meaning of this remark is clear. It is once again a question of the representation of something that cannot be expressed directly. How does this 'indirect representation' come about? Starting from the representation in the joke, we trace the path backwards through a series of easily established associations and inferences.

We can guess from the question 'Where's the Saviour: Where's the picture of the Saviour?' that the sight of the two pictures had reminded the speaker of a similar sight, familiar to him, as to us, which however, included an element that was missing here - the picture of the Saviour between two other pictures. There is only one such situation: Christ hanging between the two thieves. The missing element is brought into prominence by the joke. The similarity lies in the pictures, hanging to the right and left of the Saviour, which the joke passes over; it can only consist in the fact that the pictures hanging on the walls are pictures of thieves. What the critic wanted to say but could not say was: 'You are a couple of rascals' or, in greater detail: 'What do I care about your pictures? You are a couple of rascals - I know that!' And he did in fact end by saying it by means of a few associations and inferences, using the method which we speak of as an 'allusion'.

We at once recall where we have already come across allusion - in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion'. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish.)

In the American anecdote we now have before us an allusion without any double meaning, and we see that its characteristic is replacement by something linked to it in a conceptual connection. It may easily be guessed that the utilizable connection can be of more than one kind. In order not to lose ourselves in a maze of detail, we will discuss only the most marked variants and these only in a few examples.

The connection used for the replacement may be merely a resemblance in sound, so that this sub-species becomes analogous to puns among verbal jokes. Here, however, it is not the resemblance in sound between two *words*, but between whole sentences, characteristic phrases, and so on.

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence.¹ And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is suggested that is not said straight out - namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

A similar technical solution applies to another jest [*Scherz*] or joke [*Witz*] of Lichtenberg's: 'A girl scarcely twelve *Moden* old.' This sounds like 'twelve *Monden* [moons]', i.e. months, and may originally have been a slip of the pen for the latter, which is a permissible expression in poetry. But it also makes good sense to use the changing fashion instead of the changing moon as a method of determining a woman's age.

The connection may also consist in similarity except for a 'slight modification'. So that this technique, too, is parallel to a verbal technique. Both species of joke make almost the same impression, but they can be better distinguished from each other if we consider the processes of the joke-work.

Here is an example of a verbal joke or pun of this kind: Marie Wilt was a great singer, famous, however, for the compass not only of her voice. She suffered the humiliation of having the title of a play based on Jules Verne's well-known novel used as an allusion to her misshapen figure: 'Round the Wilt in 80 Days'.²

Or: 'Every fathom a queen', a modification of Shakespeare's familiar 'Every inch a king'. The allusion to this quotation was made with reference to an aristocratic and over-life-size lady. No very serious objection could really be made if anyone were to prefer to include this joke among the 'condensations accompanied by modifications as substitute'. (See 'tête-à-bête', p. 1631.)

¹ [In the German the first syllables of 'spas (*Bäder*)' and 'brooms (*Besen*)' sound alike; and in the German proverb the last word is 'well (*gut*)'.]

² [The German for 'world' is '*Welt*'.]

A friend said of someone who had lofty views but was obstinate in the pursuit of his aims: 'Er hat ein Ideal vor dem Kopf.' The current phrase is: 'Ein Brett vor dem Kopf haben'. The modification alludes to this phrase and makes use of its meaning for its own purposes. Here, once more, the technique might be described as 'condensation with modification'.

It is almost impossible to distinguish between 'allusion by means of modification' and 'condensation with substitution', if the modification is limited to a change of letters. For instance: 'Dichteritis' ¹ This allusion to the scourge of 'Diphtheritis' represents authorship by unqualified persons as another public danger.

Negative particles make very neat allusions possible at the cost of slight alterations:

'My fellow-*unbeliever* Spinoza', says Heine. 'We, by the *ungrace* of God, day-labourers, serfs, negroes, villeins . . .' is how Lichtenberg begins a manifesto (which he carries no further) made by these unfortunates - who certainly have more right to this title than kings and princes have to its unmodified form.

Finally, another kind of allusion consists in 'omission', which may be compared to condensation without the formation of a substitute. Actually, in every allusion something is omitted, viz. the train of thought leading to the allusion. It only depends on whether the more obvious thing is the gap in the wording of the allusion or the substitute which partly fills the gap. Thus a series of examples would lead us back from blatant omission to allusion proper.

¹ [A non-existent word, which might be translated 'authoritis' - from '*Dichter* (an author)'.]

Omission without a substitute is shown in the following example: There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: 'If X hears of this, he'll get his ears boxed again.' The technique of this joke includes, in the first place, bewilderment at its apparent nonsense, since we cannot see how getting one's ears boxed can be an immediate consequence of having heard something. The absurdity of the remark disappears if we insert in the gap: 'he'll write such a scathing article upon the man that . . . etc.' Allusion by means of omission, combined with nonsense, are accordingly the technical methods used in this joke.

'He praises himself so much that the price of fumigating candles is going up.' (Heine.) This gap is easy to fill. What is omitted has been replaced by an inference, which then leads back to what has been omitted, in the form of an allusion: 'self-praise stinks.'

And now once again two Jews outside the bath-house:

One of them sighed: 'Another year gone by already!'

These examples leave us in no doubt that here the omission forms part of the allusion.

There is still quite a marked gap to be seen in our next example, though it is a genuine and correct allusive joke. After an artists' carnival in Vienna a jest-book was circulated, in which, among others, the following highly remarkable epigram appeared:

'A wife is like an umbrella. Sooner or later one takes a cab.'

An umbrella is not enough protection against rain. The 'sooner or later' can only mean 'if it rains hard', and a cab is a public vehicle. But since we are only concerned here with the *form* of the analogy, we will postpone the closer examination of this joke to a later moment.

Heine's 'Bäder von Lucca' contains a regular wasp's nest of the most stinging allusions and makes the most ingenious use of this form of joke for polemical purposes (against Count Platen). Long before the reader can suspect what is afoot, there are foreshadowings of a particular theme, peculiarly ill-adapted for direct representation, by allusions to material of the most varied kind, - for instance, in Hirsch-Hyacinth's verbal contortions: 'You are too stout and I am too thin; you have a good deal of imagination and I have all the more business sense; I am a practicus and you are a *diarrheticus*; in short you are my complete *antipodex*.' - 'Venus *Urinia*' - 'the stout Gudel von *Dreckwall*' of Hamburg, and so on. In what follows, the events described by the author take a turn which seems at first merely to display his mischievous spirit but soon reveals its symbolic relation to his polemical purpose and at the same time shows itself as allusive. Eventually the attack on Platen bursts out, and thenceforward allusions to the theme (with which we have already been made acquainted) of the Count's love for men gushes out and overflows in every sentence of Heine's attack on his opponent's talents and character. For instance:

'Even though the Muses do not favour him, he has the Genius of Speech in his power, or rather he knows how to do violence to him. For he does not possess the free love of that Genius, he must unceasingly pursue this young man, too, and he knows how to capture only the outer forms, which, despite their lovely curves never speak nobly.'

'He is like the ostrich, which believes he is well hidden if he sticks his head in the sand, so that only his behind can be seen. Our exalted bird would have done better to hide his behind in the sand and show us his head.'

Allusion is perhaps the commonest and most easily manageable method of joking and is at the bottom of the majority of short-lived jokes which we are accustomed to weaving into our conversations and which will not bear being uprooted from their original soil and kept in isolation. But it precisely reminds us once more of the fact that had begun to puzzle us in our consideration of the technique of jokes. An allusion in itself does not constitute a joke; there are correctly constructed allusions which have no claim to such a character. Only allusions that possess that character can be described as jokes. So that the criterion of jokes, which we have pursued into their technique, eludes us there once again.

I have occasionally described allusion as 'indirect representation'; and we may now observe that the various species of allusion, together with representation by the opposite and other techniques that have still to be mentioned, may be united into a single large group, for which 'indirect representation' would be the most comprehensive name. 'Faulty reasoning', 'unification', 'indirect representation' - these, then, are the headings under which we can classify those techniques of conceptual jokes which we have come to know.

If we examine our material further, we seem to recognize a fresh sub-species of indirect representation which can be precisely characterized but of which few examples can be adduced. This is representation by something small or very small - which performs the task of giving full expression to a whole characteristic by means of a tiny detail. This group can be brought under the classification of 'allusion', if we bear in mind that this smallness is related to what has to be represented, and can be seen to proceed from it. For instance:

'A Galician Jew was travelling in a train. He had made himself really comfortable, had unbuttoned his coat and put his feet up on the seat. Just then a gentleman in modern dress entered the compartment. The Jew promptly pulled himself together and took up a proper pose. The stranger fingered through the pages of a notebook, made some calculations, reflected for a moment and then suddenly asked the Jew: "Excuse me, when is Yom Kippur (the Day of Atonement)?" "Oho!", said the Jew, and put his feet up on the seat again before answering.'

It cannot be denied that this representation by something small is related to the 'tendency to economy' which we were left with as the last common element after our investigation of verbal technique.

Here is a very similar example:

'The doctor, who had been asked to look after the Baroness at her confinement, pronounced that the moment had not come, and suggested to the Baron that in the meantime they should have a game of cards in the next room. After a while a cry of pain from the Baroness struck the ears of the two men: "Ah, mon Dieu, que je souffre!" Her husband sprang up, but the doctor signed to him to sit down: "It's nothing. Let's go on with the game!" A little later there were again sounds from the pregnant woman: "Mein Gott, mein Gott, what terrible pains!" - "Aren't you going in, Professor?" asked the Baron. - "No, no. It's not time yet." - At last there came from next door an unmistakable cry of "Aa-ee, aa-ee, aa-ee!" The doctor threw down his cards and exclaimed: "*Now it's time.*"

This successful joke demonstrates two things from the example of the way in which the cries of pain uttered by an aristocratic lady in child-birth changed their character little by little. It shows how pain causes primitive nature to break through all the layers of education, and how an important decision can be properly made to depend on an apparently trivial phenomenon.

There is another kind of indirect representation used by jokes, namely the 'analogy'. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material more strongly or more frequently than in jokes of analogy. There is a feeling - and this is probably true of a large number of other people under the same conditions - which tells me 'this is a joke, I can pronounce this to be a joke' even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signalizes a good joke makes it impossible for me to resolve the doubt in my usual way - by limiting myself to the best and most effective examples of a species.

It is easy to demonstrate that there are remarkably fine and effective examples of analogies that do not in the least strike us as being jokes. The fine analogy between the tenderness in Ottilie's diary and the scarlet thread of the English navy (p. 1629 n.) is one such. And I cannot refrain from quoting in the same sense another one, which I am never tired of admiring and the effect of which I have not grown out of. It is the analogy with which Ferdinand Lassalle ended one of his celebrated speeches for the defence ('Science and the Workers'): 'Upon a man such as I have shown you this one to be, who has devoted his life to the watchword "Science and the Workers", being convicted, if it were his lot, would make no more impression than would the bursting of a retort upon a chemist deep in his scientific experiments. As soon as the interruption is past, with a slight frown over the rebelliousness of his material, he will quietly pursue his researches and his labours.'

A rich selection of apt and joking analogies are to be found among Lichtenberg's writings (the second volume of the Göttingen edition of 1853), and it is from there that I shall take the material for our investigation.

'It is almost impossible to carry the torch of truth through a crowd without singeing someone's beard.'

No doubt that seems to be a joke; but on closer examination we, notice that the joking effect does not arise from the analogy itself but from a subsidiary characteristic. 'The torch of truth' is not a new analogy but one that has been common for a very long time and has become reduced to a *cliché* - as always happens when an analogy is lucky and accepted into linguistic usage. Though we scarcely notice the analogy any longer in the phrase 'the torch of truth', it is suddenly given back its full original force by Lichtenberg, since an addition is now made to the analogy and a consequence is drawn from it. But we are already familiar with a process like this of giving its full meaning to a watered-down expression as a technique of joking. It finds a place in the multiple use of the same material (p. 1639 f.). It might quite well be that the joking impression produced by Lichtenberg's remark arises only from its dependence on this joke-technique.

The same judgement may certainly apply as well to another joking analogy by the same author:

'To be sure, the man was not a great light [*Licht*], but a great candlestick [*Leuchter*] . . . He was a Professor of Philosophy.'

To describe a man of learning as a great light, a *lumen mundi*, has long ceased to be an effective analogy, whether or not it originally had an effect as a joke. But the analogy is refreshed, it is given back its full force, if a modification is derived from it and a second, new, analogy is thus obtained from it. The way in which this second analogy comes about seems to be what determines the joke, not the two analogies themselves. This would be an instance of the same joke-technique as in the example of the torch.

The following example seems to have the character of a joke for another reason, but one that must be judged similarly:

'Reviews seem to me to be a kind of childish illness to which new-born books are more or less liable. There are examples of the healthiest dying of it; and the weakest often get through it. Some escape it altogether. Attempts have often been made to guard against it by the amulets of preface and dedication, or even to inoculate against it by judgements of one's own. But this does not always help.'

The comparison of reviews to a childish illness is founded in the first instance on the fact of being exposed to them shortly after first seeing the light of day. I cannot venture to decide whether up to this point the comparison has the character of a joke. But it is then carried further: it turns out that the subsequent fate of new books can be represented within the framework of the same analogy or through related analogies. A prolongation like this of an analogy is undoubtedly in the nature of a joke, but we already know what technique it has to thank for this - it is a case of unification, the making of an unsuspected connection. The character of the unification is not altered by the fact that here it consists in making an addition to a previous analogy.

In another group of analogies one is tempted to shift what is undoubtedly an impression that has the character of a joke on to another factor, which once again has in itself nothing to do with the nature of the analogy. These are analogies which contain a striking juxtaposition, often a combination that sounds absurd, or which are replaced by something of the sort as the outcome of the analogy. The majority of the Lichtenberg examples belong to this group.

'It is a pity that one cannot see the learned entrails of authors so as to discover what they have eaten.' The 'learned' entrails is a bewildering and indeed absurd epithet, which is only explained by the analogy. What if the impression of its being a joke were due entirely to the bewildering character of the juxtaposition? If so, it would correspond to a method of joking with which we are quite familiar - 'representation by absurdity'

Lichtenberg has used the same analogy between the ingestion of reading and instructive matter and the ingestion of physical nourishment for another joke:

'He thought very highly of learning at home, and was therefore entirely in favour of learned stall-feeding.'

Other analogies by the same author exhibit the same absurd, or at least remarkable, assignment of epithets, which, as we now begin to see, are the true vehicles of the joke:

'That is the weather side of my moral constitution; I can stand things there quite well.'

'Everyone has his moral backside, which he does not show except in case of need and which he covers as long as possible with the breeches of respectability.'

'Moral backside' - the assignment of this remarkable epithet is the outcome of an analogy. But in addition, the analogy is continued further with an actual play upon words - 'need' - and a second even more unusual juxtaposition ('the breeches of respectability'), which is perhaps a joke in itself; for the breeches, since they are the breeches of respectability, themselves, as it were, become a joke. We need not be surprised, then, if the whole gives us the impression of being an analogy that is a very good joke. We begin to notice that we are inclined, quite generally, where a characteristic attaches only to a part of a whole, to extend it in our estimation to the whole itself. The 'breeches of respectability', incidentally, recall some similarly bewildering lines of Heine's:

. . . Bis mir endlich,
endlich alle Knöpfe rissen
an der Hose der Geduld.¹

There can be no doubt that these last two analogies have a characteristic that we do not find in every good (that is to say, in every apt) analogy. They are to a great degree 'debasing', as we might put it. They juxtapose something of a high category, something abstract (in these instances, 'respectability' and 'patience'), with something of a very concrete and even low kind ('breeches'). We shall have to consider in another connection whether this peculiarity has anything to do with the joke. Here we will try to analyse another example in which this disparaging characteristic is quite specially plain. Weinberl, the clerk in Nestroy's farce *Einen Jux will er sich machen* [*He wants to have a spree*], pictures to himself how one day, when he is a respectable old business man, he will remember the days of his youth: 'When the ice in front of the warehouse of memory has been hacked up like this in a friendly talk', he says, 'when the arched doorway of old times has been unlocked again and the showcase of the imagination is fully stocked with goods from the past. . . .' These are, to be sure, analogies between abstract and very commonplace concrete things; but the joke depends - whether entirely or in part - on the fact that a clerk is making use of analogies taken from the domain of his everyday activities. But the bringing of these abstractions into connection with the ordinary things with which his life is normally filled is an act of *unification*.

¹ [. . . Till at last,
at last every button bursts
on my breeches of patience.]

Let us return to the Lichtenberg analogies:

'The motives that lead us to do anything might be arranged like the thirty-two winds [= points of the compass] and might be given names in a similar way: for instance, "bread-bread fame" or "fame-fame-bread". As is so often the case with Lichtenberg's jokes, the impression of something apt, witty and shrewd is so prominent that our judgement upon the nature of what constitutes the joke is misled by it. If some amount of joke is admixed with the admirable meaning in a remark of this kind, we are probably led into declaring that the whole thing is an excellent joke. I should like, rather, to hazard the statement that everything in it that is really in the nature of a joke arises from our surprise at the strange combination 'bread bread-fame'. As a joke, therefore, it would be a 'representation by absurdity'.

A strange juxtaposition or the attribution of an absurd epithet can stand by itself as the outcome of an analogy:

'A *zweischläfrige* woman.' 'An *einschläfriger* church-pew.'¹ (Both by Lichtenberg.) Behind both these there is an analogy with a bed; in both of them, besides the 'bewilderment' the technical factor of 'allusion' is in operation - an allusion in one case to the sleepy effects of sermons and in the other to the inexhaustible topic of sexual relations.

So far we have found that whenever an analogy strikes us as being in the nature of a joke it owes this impression to the admixture of one of the joke-techniques that are familiar to us. But a few other examples seem at last to provide evidence that an analogy can in itself be a joke.

This is how Lichtenberg describes certain odes:

'They are in poetry what Jakob Böhme's immortal works are in prose - a kind of picnic, in which the author provides the words and the reader the sense.'

'When he philosophizes, he throws as a rule an agreeable moonlight over things, which pleases in general but shows no single thing clearly.'

¹ [These two German words - meaning literally 'that can sleep two' and 'that can sleep one' - are ordinarily applied to beds, i.e. 'double' and 'single'. *Einschläfrig*, however, can also mean 'soporific'.]

Or here is Heine:

'Her face resembled a palimpsest, on which, beneath the fresh black monastic manuscript of the text of a Church Father there lurk the half-obliterated lines of an ancient Greek love poem.'

Or let us take the lengthy analogy, with a highly degrading purpose, in the 'Bäder von Lucca'

'A catholic cleric behaves rather like a clerk with a post in a large business house. The Church, the big firm, of which the Pope is head, gives him a fixed job and, in return, a fixed salary. He works lazily, as everyone does who is not working for his own profit, who has numerous colleagues and can easily escape notice in the bustle of a large concern. All he has at heart is the credit of the house and still more its maintenance, since if it should go bankrupt he would lose his livelihood. A protestant cleric, on the other hand, is in every case his own principal and carries on the business of religion for his own profit. He does not, like his catholic fellow-traders, carry on a wholesale business but only retail. And since he must himself manage it alone, he cannot be lazy. He must advertise his articles of faith, he must depreciate his competitors' articles, and, genuine retailer that he is, he stands in his retail shop, full of business envy of all the great houses, and particularly of the great house in Rome, which pays the wages of so many thousands of book-keepers and packers and has its factories in all four quarters of the globe.'

In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of 'indirect representation' used by the joke-technique and we must leave unresolved the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether something is a joke or not offers greater difficulties in analogies than in other forms of expression.

This gap in our understanding gives us no grounds, however, for complaining that this first investigation has been without results. In view of the intimate connection which we must be prepared to attribute to the different characteristics of jokes, it would be imprudent to expect that we could completely explain one side of the problem before we have so much as cast a glance at the others. We shall no doubt have now to attack the problem from another direction.

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

¹ Cf. Chapter VI ('The Dream-Work') of my *Interpretation of Dreams*.

III

THE PURPOSES OF JOKES

When at the end of my last chapter I wrote down Heine's comparison of a catholic priest to an employee in a wholesale business and of a protestant one to a retail merchant, I was aware of an inhibition which was trying to induce me not to make use of the analogy. I told myself that among my readers there would probably be a few who felt respect not only for religion but for its governors and assistants. Such readers would merely be indignant about the analogy and would get into an emotional state which would deprive them of all interest in deciding whether the analogy had the appearance of being a joke on its own account or as a result of something extra added to it. With other analogies - for instance, the neighbouring one of the agreeable moonlight which a particular philosophy throws over things - there seemed to be no need for worry about the disturbing effect they might have on a section of my readers. The most pious man would remain in a state of mind in which he could form a judgement on our problem.

It is easy to divine the characteristic of jokes on which the difference in their hearers' reaction to them depends. In the one case the joke is an end in itself and serves no particular aim, in the other case it does serve such an aim - it becomes *tendentious*. Only jokes that have a purpose run the risk of meeting with people who do not want to listen to them.

Non-tendentious jokes were described by Vischer as 'abstract' jokes. I prefer to call them 'innocent' jokes.

Since we have already divided jokes into 'verbal' and 'conceptual' jokes according to the material handled by their technique, it devolves on us now to examine the relation between that classification and the new one that we are introducing. The relation between verbal and conceptual jokes on the one hand and abstract and tendentious jokes on the other is not one of mutual influence; they are two wholly independent classifications of joking products. Some people may perhaps have gained an impression that innocent jokes are predominantly verbal jokes, but that the more complex technique of conceptual jokes is mostly employed for definite purposes. But there are innocent jokes that work with play upon words and similarity of sound, and equally innocent ones that employ all the methods of conceptual jokes. And it is just as easy to show that a tendentious joke need be nothing other than a verbal joke as regards its technique. For instance, jokes that 'play about' with proper names often have an insulting and wounding purpose, though, needless to say, they are verbal jokes. But the most innocent of all jokes are once more verbal jokes; for instance, the *Schüttelreime*¹, which have recently become so popular and in which the multiple use of the same material with a modification entirely peculiar to it constitutes the technique:

Und weil er Geld in *Menge* hatte,
lag stets er in der *Hängematte*.²

It may be hoped that no one will question that the enjoyment derived from these otherwise unpretentious rhymes is the same as that by which we recognize jokes.

¹ [Literally, 'shaking-up rhymes'.]

² [And because he had money in quantities
He always lay in a hammock.]

Good examples of abstract or innocent conceptual jokes are to be found in plenty among the Lichtenberg analogies, with some of which we have already become acquainted. I add a few more:

'They had sent a small octavo volume to Göttingen, and had got back something that was a quarto in body and soul.'

'In order to erect this building properly, it is above all necessary that good foundations shall be laid; and I know of none firmer than if, upon every course of masonry *pro*, one promptly lays a course *contra*.'

'One person procreates a thought, a second carries it to be baptized, a third begets children by it, a fourth visits it on its deathbed and a fifth buries it.' (Analogy with unification.)

'Not only did he disbelieve in ghosts; he was not even frightened of them.' Here the joke lies entirely in the nonsensical form of representation, which puts what is commonly thought less of into the comparative and uses the positive for what is regarded as more important. If this joking envelope is removed, we have: 'it is much easier to get rid of a fear of ghosts intellectually than to escape it when the occasion arises.' This is no longer in the least a joke, though it is a correct and still too little appreciated psychological discovery - the same one which Lessing expressed in a well-known sentence:

'Not all are free who mock their chains.'

I may take the opportunity that this affords of getting rid of what is nevertheless a possible misunderstanding. For 'innocent' or 'abstract' jokes are far from having the same meaning as jokes that are 'trivial' or 'lacking in substance'; they merely connote the opposite of the 'tendentious' jokes that will be discussed presently. As our last example shows, an innocent - that is, a non-tendentious - joke may also be of great substance it may assert something of value. But the substance of a joke is independent of the joke and is the substance of the thought which is here, by means of a special arrangement, expressed as a joke. No doubt, just as watch-makers usually provide a particularly good movement with a similarly valuable case, so it may happen with jokes that the best achievements in the way of jokes are used as an envelope for thoughts of the greatest substance.

If now we draw a sharp distinction in the case of conceptual jokes between the substance of the thought and the joking envelope, we shall reach a discovery which may throw light of much of our uncertainty in judging jokes. For it turns out - and this is a surprising thing - that our enjoyment of a joke is based on a combined impression of its substance and of its effectiveness as a joke and that we let ourselves be deceived by the one factor over the amount of the other. Only after the joke has been reduced do we become aware of this false judgement.

Moreover, the same thing is true of verbal jokes. When we are told that 'experience consists in experiencing what one does not wish to experience', we are bewildered and think we have learnt a new truth. It is a little time before we recognize under this disguise the platitude of 'Injury makes one wise'. (Fischer.) The apt way in which the joke succeeds in defining 'experience' almost purely by the use of the word 'to experience' deceives us into overvaluing the substance of the sentence. Just the same thing is true of Lichtenberg's 'January' joke of unification (p. 1667), which has nothing more to tell us than something we have already long known - that New Year's wishes come true as seldom as other wishes. So too in many similar cases.

And we find just the contrary with other jokes, in which the aptness and truth of the thought tricks us into calling the whole sentence a brilliant joke - whereas only the thought is brilliant and the joke's achievement is often feeble. Precisely in Lichtenberg's jokes the kernel of thought is frequently far more valuable than the joking envelope to which we unjustifiably extend our appreciation. Thus, for instance, the remark about the 'torch of truth' (p. 1682) is an analogy that scarcely amounts to a joke, but it is so apt that we are inclined to insist that the sentence is a particularly good joke.

Lichtenberg's jokes are outstanding above all on account of their intellectual content and the certainty with which they hit their mark. Goethe was quite right in saying of that author that in fact his joking and jesting ideas concealed problems; it would have been even more correct to say that they touch on the solution of problems. When, for instance, he remarked as a joke: 'He had read Homer so much that he always read "*Agamemnon*" instead of "*angenommen*"' - the technique used is 'stupidity' plus 'similarity of sound' - Lichtenberg had discovered nothing less than the secret of misreading.¹

Similarly with a joke the technique of which struck us as most unsatisfactory (p. 1661): 'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are'. The stupidity that is paraded here is only apparent. In fact, behind this simple remark lies the great problem of teleology in the structure of animals. It was by no means so completely a matter of course that the palpebral fissure should open at the point at which the cornea is exposed, until the theory of evolution had thrown light on the coincidence.

We shall bear in mind the fact that we receive from joking remarks a total impression in which we are unable to separate the share taken by the thought content from the share taken by the joke-work. It may be that later on we shall find a still more significant parallel to this.

¹ See my *Psychopathology of Everyday Life* (1901b)

From the point of view of throwing theoretical light on the nature of jokes, innocent jokes are bound to be of more value to us than tendentious ones, and trivial jokes of more value than profound ones. Innocent and trivial jokes are likely to put the problem of jokes before us in its purest form, since with them we avoid the danger of being confused by their purpose or having our judgement misled by their good sense. On the basis of such material our discoveries can make fresh advances.

I will select the most innocent possible example of a verbal joke:

‘A girl to whom a visitor was announced while she was at her toilet complained: "Oh, what a shame that one mayn't let oneself be seen just when one's at one's most *anziehend*"'¹ (Kleinpaul, 1890.)

Since, however, doubts arise in me after all as to whether I have a right to describe this joke as being non-tendentious, I will replace it by another one which is extremely simple and should really not be open to that objection.

At the end of a meal in a house to which I had been invited as a guest, a pudding of the kind known as a ‘*roulard*’ was served. It requires some skill on the part of the cook to make it; so one of the guests asked: ‘Made in the house?’ To which the host replied: ‘Yes, indeed. A home-*roulard*.’

¹ [‘*Anziehend*’ means both ‘dressing’ and ‘attractive’.]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

We cannot proceed further at this point without a discussion with our philosophical authorities.

The philosophers, who count jokes a part of the comic and who treat of the comic itself under the heading of aesthetics, define an aesthetic idea by the condition that in it we are not trying to get anything from things or do anything with them, that we are not needing things in order to satisfy one of our major vital needs, but that we are content with contemplating them and with the enjoyment of the idea. 'This enjoyment, this kind of ideation, is the purely aesthetic one, which lies only in itself, which has its aim only in itself and which fulfils none of the other aims of life.' (Fischer, 1889, 20.)

We shall scarcely be contradicting this statement of Fischer's - we shall perhaps be doing no more than translating his thoughts into our mode of expression - if we insist that the joking activity should not, after all, be described as pointless or aimless, since it has the unmistakable aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake *anything* without having an intention in view. If we do not require our mental apparatus at the moment for supplying one of our indispensable satisfactions, we allow it itself to work in the direction of pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to enlarge on this statement. As regards joking, however, I can assert, on the basis of the two discoveries we have already made, that it is an activity which aims at deriving pleasure from mental processes, whether intellectual or otherwise. No doubt there are other activities which have the same aim. They are perhaps differentiated according to the fields of mental activity from which they seek to derive pleasure or perhaps according to the methods of which they make use. We cannot for the moment decide about this; but we hold firmly to the view that the joke technique and the tendency towards economy by which it is partly governed (p. 1647 ff.) have been brought into connection with the production of pleasure.

But before we set about solving the riddle of how the technical methods of the joke-work are able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all, try to throw light on the question of what the purposes of jokes are, and how they serve those purposes.

There is, first and foremost, one observation which warns us not to leave tendentious jokes on one side in our investigation of the origin of the pleasure we take in jokes. The pleasurable effect of innocent jokes is as a rule a moderate one; a clear sense of satisfaction, a slight smile, is as a rule all it can achieve in its hearers. And it may be that a part even of this effect is to be attributed to the joke's intellectual content, as we have seen from suitable examples (p. 1690). A non-tendentious joke scarcely ever achieves the sudden burst of laughter which makes tendentious ones so irresistible. Since the technique of both can be the same, a suspicion may be aroused in us that tendentious jokes, by virtue of their purpose, must have sources of pleasure at their disposal to which innocent jokes have no access.

The purposes of jokes can easily be reviewed. Where a joke is not an aim in itself - that is, where it is not an innocent one - there are only two purposes that it may serve, and these two can themselves be subsumed under a single heading. It is either a *hostile* joke (serving the purpose of aggressiveness, satire, or defence) or an *obscene* joke (serving the purpose of exposure). It must be repeated in advance that the technical species of the joke - whether it is a verbal or a conceptual joke - bears no relation to these two purposes.

It is a much lengthier business to show the way in which jokes serve these two purposes. In this investigation I should prefer to deal first not with the hostile jokes but with the exposing jokes. It is true that these have been far more rarely deemed worthy of investigation, as though aversion to the thing itself had here been transferred to the discussion of it. But we will not allow ourselves to be disconcerted by this, for we shall immediately come upon a marginal case of joking which promises to bring us enlightenment on more than one obscurity,

We know what is meant by 'smut': the intentional bringing into prominence of sexual facts and relations by speech. This definition, however, is no more valid than other definitions. In spite of this definition, a lecture on the anatomy of the sexual organs or the physiology of procreation need not have a single point of contact with smut. It is a further relevant fact that smut is directed to a particular person, by whom one is sexually excited and who, on hearing it, is expected to become aware of the speaker's excitement and as a result to become sexually excited in turn. Instead of this excitement the other person may be led to feel shame or embarrassment, which is only a reaction against the excitement and, in a roundabout way, is an admission of it. Smut is thus originally directed towards women and may be equated with attempts at seduction. If a man in a company of men enjoys telling or listening to smut, the original situation, which owing to social inhibitions cannot be realized, is at the same time imagined. A person who laughs at smut that he hears is laughing as though he were the spectator of an act of sexual aggression.

The sexual material which forms the content of smut includes more than what is *peculiar* to each sex; it also includes what is *common* to both sexes and to which the feeling of shame extends - that is to say, what is excremental in the most comprehensive sense. This is, however, the sense covered by sexuality in childhood, an age at which there is, as it were, a cloaca within which what is sexual and what is excremental are barely or not at all distinguished.¹ Throughout the whole range of the psychology of the neuroses, what is sexual includes what is excremental, and is understood in the old, infantile, sense.

¹ See my *Three Essays on the Theory of Sexuality* (1905d), which is appearing at the same time as the present work.

Smut is like an exposure of the sexually different person to whom it is directed. By the utterance of the obscene words it compels the person who is assailed to imagine the part of the body or the procedure in question and shows her that the assailant is himself imagining it. It cannot be doubted that the desire to see what is sexual exposed is the original motive of smut.

It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.¹ The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

In men a high degree of this trend persists as a portion of their libido, and it serves to introduce the sexual act. When this urge makes itself felt at the first approach to a woman, it must make use of words, for two reasons; firstly, to announce itself to her, and secondly, because if the idea is aroused by speech it may induce a corresponding excitement in the woman herself and may awaken an inclination in her to passive exhibitionism. A wooing speech like this is not yet smut, but it passes over into it. If the woman's readiness emerges quickly the obscene speech has a short life; it yields at once to a sexual action. It is otherwise if quick readiness on the woman's part is not to be counted on, and if in place of it defensive reactions appear. In that case the sexually exciting speech becomes an aim in itself in the shape of smut. Since the sexual aggressiveness is held up in its advance towards the act, it pauses at the evocation of the excitement and derives pleasure from the signs of it in the woman. In so doing, the aggressiveness is no doubt altering its character as well, just as any libidinal impulse will if it is met by an obstacle. It becomes positively hostile and cruel, and it thus summons to its help against the obstacle the sadistic components of the sexual instinct.

The woman's inflexibility is therefore the first condition for the development of smut, although, to be sure, it seems merely to imply a postponement and does not indicate that further efforts will be in vain. The ideal case of a resistance of this kind on the woman's part occurs if another man is present at the same time - a third person -, for in that case an immediate surrender by the woman is as good as out of the question. This third person soon acquires the greatest importance in the development of the smut; to begin with, however, the presence of the woman is not to be overlooked. Among country people or in inns of the humbler sort it will be noticed that it is not until the entrance of the barmaid or the innkeeper's wife that smuttiness starts up. Only at higher social levels is the opposite found, and the presence of a woman brings the smut to an end. The men save up this kind of entertainment, which originally presupposed the presence of a woman who was feeling ashamed, till they are 'alone together'. So that gradually, in place of the woman, the onlooker, now the listener, becomes the person to whom the smut is addressed, and owing to this transformation it is already near to assuming the character of a joke.

From this point onwards our attention will be drawn to two factors: the part played by the third person, the listener, and the conditions governing the subject-matter of the smut itself.

¹ Cf. Moll's instinct of 'contrectation' (Moll, 1898).

Generally speaking, a tendentious joke calls for three people: in addition to the one who makes the joke, there must be a second who is taken as the object of the hostile or sexual aggressiveness, and a third in whom the joke's aim of producing pleasure is fulfilled. We shall have later to examine the deeper reasons for this state of things; for the moment let us keep to the fact to which this testifies - namely that it is not the person who makes the joke who laughs at it and who therefore enjoys its pleasurable effect, but the inactive listener. In the case of smut the three people are in the same relation. The course of events may be thus described. When the first person finds his libidinal impulse inhibited by the woman, he develops a hostile trend against that second person and calls on the originally interfering third person as his ally. Through the first person's smutty speech the woman is exposed before the third, who, as listener, has now been bribed by the effortless satisfaction of his own libido.

It is remarkable how universally popular a smutty interchange of this kind is among the common people and how it unflinchingly produces a cheerful mood. But it also deserves to be noticed that in this complicated procedure, which involves so many of the characteristics of tendentious jokes, none of the formal requirements which characterize jokes are made of the smut itself. The uttering of an undisguised indecency gives the first person enjoyment and makes the third person laugh.

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychological process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychological organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychological force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.

We will now examine the question of whether jokes play the same part in the service of a *hostile* purpose. Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

We are now prepared to realize the part played by jokes in hostile aggressiveness. A joke will allow us to exploit something ridiculous in our enemy which we could not, on account of obstacles in the way, bring forward openly or consciously; once again, then, the joke *will evade restrictions and open sources of pleasure that have become inaccessible*. It will further bribe the hearer with its yield of pleasure into taking sides with us without any very close investigation, just as on other occasions we ourselves have often been bribed by an innocent joke into over estimating the substance of a statement expressed jokingly. This is brought out with perfect aptitude in the common phrase '*die Lacher auf seine Seite ziehen* [to bring the laughers over to our side]'

Let us, for instance, consider Herr N.'s jokes, which were scattered over the last chapter. They are all of them pieces of invective. It is as though Herr N. wanted to exclaim aloud: 'The Minister for Agriculture is himself an ox!' 'Don't talk to me about * * * *! He's bursting with vanity!' 'I've never in my life read anything more boring than this historian's essays on Napoleon in Austria!' But the high position he occupies makes it impossible for him to give out his judgements in that form. They therefore bring in a joke to their help, and this in turn guarantees them a reception with the hearer which they would never have found in a non-joking form, in spite of the truth they might contain. One of these jokes is particularly instructive - the one about the 'red *Fadian*', perhaps the most impressive of all of them. What is there about it that makes us laugh and diverts our interest so completely from the question of whether or not an injustice has been done to the poor author? The joking form, of course - that is to say, the joke; but what is there about it that we are laughing at? No doubt at the person himself, who is introduced to us as the 'red *Fadian*', and in particular at his having red hair. Educated people have broken themselves of the habit of laughing at physical defects, and moreover they do not include having red hair among the laughable physical failings. But there is no doubt that it is so regarded by schoolboys and the common people - and this is still true even at the level of education of certain municipal and parliamentary representatives. And now Herr N. has made it possible in the most ingenious manner for us, grown-up and sensitive people, to laugh like the schoolboys at the historian X's red hair. This was certainly not Herr N.'s intention; but it is most doubtful whether a person who gives free play to a joke must necessarily know its precise intention.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

The prevention of invective or of insulting rejoinders by external circumstances is such a common case that tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority. The joke then represents a rebellion against that authority, a liberation from its pressure. The charm of caricatures lies in this same factor: we laugh at them even if they are unsuccessful simply because we count rebellion against authority as a merit.

If we bear in mind the fact that tendentious jokes are so highly suitable for attacks on the great, the dignified and the mighty, who are protected by internal inhibitions and external circumstances from direct disparagement, we shall be obliged to take a special view of certain groups of jokes which seem to be concerned with inferior and powerless people. I am thinking of the anecdotes about marriage-brokers, some of which we became acquainted with in the course of our investigation of the various techniques of conceptual jokes. In a few of them, for instance in the examples 'She's deaf as well' and 'Who would lend these people anything?', the broker is laughed at for his improvidence and thoughtlessness and he becomes comic because the truth escapes him as it were automatically. But does what we have learnt of the nature of tendentious jokes on the one hand and on the other hand our great enjoyment of these stories fit in with the paltriness of the people whom these jokes seem to laugh at? Are they worthy opponents of the jokes? Is it not rather the case that the jokes only put forward the marriage-brokers in order to strike at something more important? Is it not a case of saying one thing and meaning another? It is really not possible to reject this view.

This interpretation of the broker anecdotes may be carried further. It is true that there is no *necessity* for my entering into them, that I can content myself with regarding these anecdotes as '*Schwänke* [funny stories]' and deny that they have the character of a joke. Thus jokes can also have a subjective determinant of this kind. Our attention has now been drawn to that possibility and we shall have to examine it later. It declares that only what I allow to be a joke *is* a joke. What is a joke to me may be merely a comic story to other people. But if a joke admits of this doubt, the reason can only be that it has a façade - in these instances a comic one - in the contemplation of which one person is satiated while another may try to peer behind it. A suspicion may arise, moreover, that this façade is intended to dazzle the examining eye and that these stories have therefore something to conceal.

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the *Schadchen* into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

¹ This is the same mechanism that governs slips of the tongue and other phenomena of self-betrayal. See *The Psychopathology of Everyday Life* (1901b).

Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a '*fait accompli*'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What *do* you want? Isn't she to have a single fault?', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction.

The mockery directed at the suitor in these examples, in which the broker quite appropriately plays the part of a superior, is expressed much more plainly in other anecdotes. The plainer these stories are, the less joke-technique do they contain; they are, as it were, only marginal cases of jokes, with the technique of which they no longer have anything in common but the construction of a façade. But owing to their having the same purpose and to its being concealed behind the facade, they produce the complete effect of a joke. Moreover, the poverty of their technical methods explains how it is that many of these jokes cannot, without suffering damage, dispense with the element of dialect, which has an effect similar to the joke technique.

A story of this sort, which, while possessing all the force of a tendentious joke, exhibits nothing of its technique, is the following: 'The marriage-broker asked: "What do you require of your bride?" - Answer: "She must be beautiful, she must be rich, and educated." - "Very good", said the broker, "but I count that as making three matches."' Here the rebuke to the man is delivered openly, and is no longer clothed as a joke.

In the examples we have considered hitherto, the disguised aggressiveness has been directed against *people* - in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke's attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.

I may recall the two stories - one of the impoverished *gourmet* who was caught eating 'salmon mayonnaise' and the other of the dipsomaniac tutor - which we learnt to know as sophisticated displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is *wrong*. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's '*Carpe diem*', which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - '*Carpe diem*' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? '*Di doman' non c'è certezza*.'¹

¹ ['There is no certainty about tomorrow.'] Lorenzo de' Medici.

I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods - even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution of the conflict.

We now know the name that must be given to jokes like those that we have last interpreted. They are *cynical* jokes and what they disguise are cynicisms.

Among the institutions which cynical jokes are in the habit of attacking none is more important or more strictly guarded by moral regulations but at the same time more inviting to attack than the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There is no more personal claim than that for sexual freedom and at no point has civilization tried to exercise severer suppression than in the sphere of sexuality. A single example will be enough for our purposes - the one mentioned on p. 1678, 'An Entry in Prince Carnival's Album':

'A wife is like an umbrella - sooner or later one takes a cab.'

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it *has* declared it.

A particularly favourable occasion for tendentious jokes is presented when the intended rebellious criticism is directed against the subject himself, or, to put it more cautiously, against someone in whom the subject has a share - a collective person, that is (the subject's own nation, for instance). The occurrence of self-criticism as a determinant may explain how it is that a number of the most apt jokes (of which we have given plenty of instances) have grown up on the soil of Jewish popular life. They are stories created by Jews and directed against Jewish characteristics. The jokes made about Jews by foreigners are for the most part brutal comic stories in which a joke is made unnecessary by the fact that Jews are regarded by foreigners as comic figures. The Jewish jokes which originate from Jews admit this too; but they know their real faults as well as the connection between them and their good qualities, and the share which the subject has in the person found fault with creates the subjective determinant (usually so hard to arrive at) of the joke-work. Incidentally, I do not know whether there are many other instances of a people making fun to such a degree of its own character.

¹ See his essays (1903).

As an example of this I may take the anecdote, quoted on p. 1679 f., of a Jew in a railway train promptly abandoning all decent behaviour when he discovered that the newcomer into his compartment was a fellow-believer. We made the acquaintance of this anecdote as evidence of something being demonstrated by a detail, of representation by something very small. It is meant to portray the democratic mode of thinking of Jews, which recognizes no distinction between lords and serfs, but also, alas, upsets discipline and co-operation.

Another, especially interesting group of jokes portrays the relation of poor and rich Jews to one another. Their heroes are the '*Schnorrer*' and the charitable householder or the Baron.

'A *Schnorrer*, who was allowed as a guest into the same house every Sunday, appeared one day in the company of an unknown young man who gave signs of being about to sit down to table. "Who is this?" asked the householder. "He's been my son-in law", was the reply, "since last week. I've promised him his board for the first year."

The purpose of these stories is always the same; it emerges most clearly in the next one:

'The *Schnorrer* begged the Baron for some money for a journey to Ostend; his doctor had recommended sea-bathing for his troubles. The Baron thought Ostend was a particularly expensive resort; a cheaper one would do equally well. The *Schnorrer*, however, rejected the proposal with the words: "Herr Baron, I consider nothing too expensive for my health." This is an excellent displacement joke which we might have taken as a model for that class.¹ The Baron evidently wants to save his money, but the *Schnorrer* answers as though the Baron's money was his own, which he may then quite well value less than his health. Here we are expected to laugh at the impertinence of the demand; but it is rarely that these jokes are not equipped with a façade to mislead the understanding. The truth that lies behind is that the *Schnorrer*, who in his thoughts treats the rich man's money as his own, has actually, according to the sacred ordinances of the Jews, almost a right to make this confusion. The indignation raised by this joke is of course directed against a Law which is highly oppressive even to pious people.

Here is another anecdote:

'A *Schnorrer* on his way up a rich man's staircase met a fellow member of his profession, who advised him to go no further. "Don't go up to-day," he said, "the Baron is in a bad mood to-day; he's giving nobody more than one florin." - "I'll go up all the same", said the first *Schnorrer* "Why should I give him a florin? Does he give *me* anything?" '

This joke employs the technique of absurdity, since it makes the *Schnorrer* assert that the Baron gives him nothing at the very moment at which he is preparing to beg him for a gift. But the absurdity is only apparent. It is almost true that the rich man gives him nothing, since he is obliged by the Law to give him alms and should, strictly speaking, be grateful to him for giving him an opportunity for beneficence. The ordinary, middle-class view of charity is in conflict here with the religious one; it is in open rebellion against the religious one in the other story, of the Baron who, deeply moved by a *Schnorrer's* tale of woe, rang for his servants: 'Throw him out! he's breaking my heart!' This open revelation of its purpose constitutes once more a marginal case of a joke. It is only in the fact that they present the matter as applied to individual cases that these last stories differ from a complaint which is no longer a joke: 'There is really no advantage in being a rich man if one is a Jew. Other people's misery makes it impossible to enjoy one's own happiness.'

Other stories, which are once again technically frontier cases of jokes, give evidence of a profoundly pessimistic cynicism. For instance:

'A man who was hard of hearing consulted the doctor, who correctly diagnosed that the patient probably drank too much brandy and was on that account deaf. He advised him against it and the deaf man promised to take his advice to heart. After a while the doctor met him in the street and asked him in a loud voice how he was. "Thank you", was the answer. "You needn't shout so loud, doctor. I've given up drinking and hear quite well again." A little while later they met once more. The doctor asked him how he was in his ordinary voice, but noticed that his question had not been understood. "Eh? What was that?" - "It seems to me you're drinking brandy again", shouted the doctor in his ear, "and that's why you're deaf again." "You may be right," replied the deaf man, "I *have* begun drinking brandy again and I'll tell you why. So long as I didn't drink I was able to hear. But nothing I heard was as good as the brandy." Technically this joke is nothing other than an object-lesson: dialect or skill in narrative are necessary for raising a laugh, but in the background lies the sad question: may not the man have been right in his choice?

It is on account of the allusion made by these pessimistic stories to the manifold and hopeless miseries of the Jews that I must class them with tendentious jokes.

Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's '*Kück*, the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his death-bed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.'¹ This is a disparaging comparison (technically perhaps only having the value of an allusion), since a '*métier*', a trade or profession, is what a workman or a doctor has - and he has only a single *métier*. But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).' So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to be the created being revealed itself just before its annihilation as the creator.

¹ ['Of course he'll forgive me: that's his job.']

To the classes of tendentious jokes that we have considered so far -
 exposing or obscene jokes,
 aggressive (hostile) jokes,
 cynical (critical, blasphemous) jokes -

I should like to add another, the fourth and rarest, the nature of which can be illustrated by a good example:

'Two Jews met in a railway carriage at a station in Galicia. "Where are you going?" asked one. "To Cracow", was the answer. "What a liar you are!" broke out the other. "If you say you're going to Cracow, you want me to believe you're going to Lemberg. But I know that in fact you're going to Cracow. So why are you lying to me?"'

This excellent story, which gives an impression of over-subtlety, evidently works by the technique of absurdity. The second Jew is reproached for lying because he says he is going to Cracow, which is in fact his destination! But the powerful technical method of absurdity is here linked with another technique, representation by the opposite, for, according to the uncontradicted assertion of the first Jew, the second is lying when he tells the truth and is telling the truth by means of a lie. But the more serious substance of the joke is the problem of what determines the truth. The joke, once again, is pointing to a problem and is making use of the uncertainty of one of our commonest concepts. Is it the truth if we describe things as they are without troubling to consider how our hearer will understand what we say? Or is this only jesuitical truth, and does not genuine truth consist in taking the hearer into account and giving him a faithful picture of our own knowledge? I think that jokes of this kind are sufficiently different from the rest to be given a special position. What they are attacking is not a person or an institution but the certainty of our knowledge itself, one of our speculative possessions. The appropriate name for them would therefore be 'sceptical' jokes.

In the course of our discussion of the purposes of jokes we have perhaps thrown light on a number of questions and have certainly come upon plenty of suggestions for further enquiries. But the findings of this chapter combine with those of the last one to present us with a difficult problem. If it is correct to say that the pleasure provided by jokes depends on the one hand on their technique and on the other hand on their purpose, from what common point of view can such different sources of the pleasure in jokes be brought together?

B. SYNTHETIC PART

IV

THE MECHANISM OF PLEASURE AND THE PSYCHOGENESIS OF JOKES

We can now start out from an assured knowledge of the sources of the peculiar pleasure given us by jokes. We are aware that we may be deceived into confusing our enjoyment of the intellectual content of what is stated with the pleasure proper to jokes; but we know that that pleasure itself has at bottom two sources - the technique and the purposes of jokes. What we now want to discover is the way in which the pleasure arises from these sources, the mechanism of the pleasurable effect.

We shall, I think, find the explanation we are in search of far easier from tendentious jokes than from innocent ones. We will therefore begin with the former.

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is linked with particular conditions, from which we may perhaps arrive at some further information. Two cases are to be distinguished here. The simpler one is where the satisfaction of the purpose is opposed by an external obstacle which is evaded by the joke. We found this, for instance, in the reply received by Serenissimus to his question of whether the mother of the man he was speaking to had ever lived in the Palace and in the critic's rejoinder to the two rich rascals who showed him their portraits: 'But where's the Saviour?' In the former case the purpose was to answer one insult by another, and in the latter it was to hand across an insult instead of the assessment that had been asked for. What opposed the purpose were purely external factors - the powerful position of the people at whom the insults were directed. It may nevertheless strike us that, however much these and analogous jokes of a tendentious nature may satisfy us, they are not able to provoke much laughter.

It is otherwise when what stands in the way of the direct realization of the purpose is not an external factor but an internal obstacle, when an internal impulse opposes the purpose. This condition would seem, on our hypothesis, to be fulfilled in the jokes of Herr N., in whom a strong inclination to invective is held in check by a highly developed aesthetic culture. By the help of a joke, this internal resistance is overcome in the particular case and the inhibition lifted. By that means, as in the instance of the external obstacle, the satisfaction of the purpose is made possible and its suppression, together with the 'psychical damming-up' that this would involve, is avoided. To that extent the mechanism of the generation of pleasure would be the same in the two cases.

Nevertheless, we are inclined here to go more deeply into the distinctions between the psychological situation in the cases of an external and an internal obstacle, for we have a suspicion that the removal of an internal obstacle may make an incomparably higher contribution to the pleasure. But I suggest that at this point we should exercise moderation and be satisfied for the moment with establishing what remains the essential point for us. The cases of an external and an internal obstacle differ only in the fact that in the latter an already existing inhibition is lifted and that in the former the erection of a new one is avoided. That being so, we shall not be relying too much on speculation if we assert that both for erecting and for maintaining a psychical inhibition some 'psychical expenditure' is required. And, since we know that in both cases of the use of tendentious jokes pleasure is obtained, it is therefore plausible to suppose that *this yield of pleasure corresponds to the psychical expenditure that is saved*.

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes.

A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that '*economy in expenditure on inhibition or suppression*' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.

On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the *sound* of the word instead of upon its *meaning* - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.¹

In a second group of technical methods used in jokes - unification, similarity of sound, multiple use, modification of familiar phrases, allusions to quotations - we can single out as their common characteristic the fact that in each of them something familiar is rediscovered, where we might instead have expected something new. This rediscovery of what is familiar is pleasurable, and once more it is not difficult for us to recognize this pleasure as a pleasure in economy and to relate it to economy in psychical expenditure.

¹ If I may be allowed to anticipate the exposition in the text, I can at this point throw light on the condition which seems to determine whether a joke is to be called a 'good' or a 'bad' one. If, by means of a word with two meanings or a word that is only slightly modified, I take a short cut from one circle of ideas to another, and if there is not at the same time a link between those circles of ideas which has a significant sense, then I shall have made a 'bad' joke. In a bad joke like this the only existing link between the two disparate ideas is the one word - the 'point' of the joke. The example of 'Home-Roulard' quoted above is a joke of this kind. A 'good' joke, on the other hand, comes about when what children expect proves correct and the similarity between the words is shown to be really accompanied by another, important similarity in their sense. Such, for instance, is the example 'Traduttore - Traditore'. The two disparate ideas, which are here linked by an external association, are also united in a significant relation which indicates an essential kinship between them. The external association merely takes the place of the internal connection; it serves to point it out or make it clear. A 'translator' is not only called by a similar name to a 'traitor'; he actually in a kind of traitor and bears the name, as it were by right.

The distinction that is here developed coincides with the one which is to be introduced later between a 'jest' and a 'joke'. But it would be unjust to exclude examples like 'Home-Roulard' from the discussion of the nature of jokes. As soon as we take into consideration the peculiar pleasure derived from jokes, we find that the 'bad' jokes are by no means bad as jokes - that is, unsuitable for producing pleasure.

It seems to be generally agreed that the rediscovery of what is familiar, 'recognition', is pleasurable. Groos (1899, 153) writes: 'Recognition is always, unless it is too much mechanized (as, for instance, in dressing, . . .), linked with feelings of pleasure. The mere quality of familiarity is easily accompanied by the quiet sense of comfort which Faust felt when, after an uncanny encounter, he entered his study once again . . . If the act of recognition thus gives rise to pleasure, we might expect that men would hit on the idea of exercising this capacity for its own sake - that is, would experiment with it in play. And in fact Aristotle regarded joy in recognition as the basis of the enjoyment of art, and it cannot be disputed that this principle should not be overlooked, even if it does not possess such far-reaching significance as Aristotle attributes to it.'

Groos goes on to discuss games whose characteristic lies in the fact that they intensify the joy in recognition by putting obstacles in its way - that is to say, by creating a 'psychical damming up', which is got rid of by the act of recognition. His attempt at an explanation, however, abandons the hypothesis that recognition is pleasurable in itself, since, by referring to these games, he is tracing back the enjoyment of recognition to a joy in *power*, a joy in the overcoming of a difficulty. I regard the latter factor as secondary, and I see no reason to depart from the simpler view that recognition is pleasurable in itself i.e., through relieving psychical expenditure - and that the games founded on this pleasure make use of the mechanism of damming up only in order to increase the amount of such pleasure.

It is also generally acknowledged that rhymes, alliterations, refrains, and other forms of repeating similar verbal sounds which occur in verse, make use of the same source of pleasure - the rediscovery of something familiar. The 'sense of power' plays no perceptible part in these techniques, which show so much similarity to that of 'multiple use' in the case of jokes.

In view of the close connection between recognizing and remembering, it is not rash to suppose that there may also be a pleasure in remembering - that the act of remembering is in itself accompanied by a feeling of pleasure of similar origin. Groos seems not to be averse to such a hypothesis, but he derives it once again from the 'sense of power', to which he attributes (wrongly, in my view) the chief reason for enjoyment in almost all games.

The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' does not seem to me to-day nearly so good as it did at the time when 'Home Rule' provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence', has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the *double-entendre* in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a *Verbrennung* [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge *you* three thousand as you have been *durchgebrannt* [literally 'been burnt through' - slang for 'eloped'] once already.' A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was *durchgebrannt*.

Thus a great number of the jokes in circulation have a certain length of life: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure.

Unification, which is after all no more than repetition in the sphere of thought-connections instead of in that of subject-matter, was given special recognition by Fechner as a source of the pleasure in jokes. He writes (Fechner, 1897, 1, Chapter XVII): 'In my opinion the chief part in the field we are now considering is played by the principle of the unified linking of multiplicities; it requires support, however, from auxiliary determinants in order that the enjoyment which can be derived from these cases, with its peculiar character, may be carried over the threshold.'¹

In all these cases of repeating the same connections or the same subject-matter in the words, or of rediscovering what is familiar or recent, it seems impossible to avoid deriving the pleasure felt in them from economy in psychical expenditure provided that this line of approach turns out to be fruitful in throwing light on details and in arriving at new generalities. We are aware that we have still to make it clear how the economy comes about and what the meaning is of the expression 'psychical expenditure'.

The third group of techniques of jokes - for the most part of conceptual jokes - which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at a first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object-associations by word-associations. Nevertheless it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure.

¹ The title of Chapter XVII is 'On significant and joking similes, play upon words and other cases which bear the character of being amusing, funny or ridiculous.'

It cannot be doubted that it is easier and more convenient to diverge from a line of thought we have embarked on than to keep to it, to jumble up things that are different rather than to contrast them - and, indeed, that it is *especially* convenient to admit as valid methods of inference that are rejected by logic and, lastly, to put words or thoughts together without regard to the condition that they ought also to make sense. This cannot be doubted; and these are precisely the things that are done by the joke-techniques which we are discussing. But the hypothesis that behaviour of this kind by the joke-work provides a source of pleasure will strike us as strange, since apart from jokes all such inefficient intellectual functioning produces in us nothing but unpleasurable defensive feelings.

'Pleasure in nonsense', as we may call it for short, is concealed in serious life to a vanishing point. In order to demonstrate it we must investigate two cases - one in which it is still visible and one in which it becomes visible again: the behaviour of a child in learning, and that of an adult in a toxically altered state of mind.

During the period in which a child is learning how to handle the vocabulary of his mother-tongue, it gives him obvious pleasure to 'experiment with it in play', to use Groos's words. And he puts words together without regard to the condition that they should make sense, in order to obtain from them the pleasurable effect of rhythm or rhyme. Little by little he is forbidden this enjoyment, till all that remains permitted to him are significant combinations of words. But when he is older attempts still emerge at disregarding the restrictions that have been learnt on the use of words. Words are disfigured by particular little additions being made to them, their forms are altered by certain manipulations (e.g. by reduplications or '*Zittersprache*'), or a private language may even be constructed for use among playmates. These attempts are found again among certain categories of mental patients.

Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance.

Nor, later on, does the University student cease these demonstrations against the compulsion of logic and reality, the dominance of which, however, he feels growing ever more intolerant and unrestricted. A large amount of student 'rags' are a part of this reaction. For man is a 'tireless pleasure-seeker' - I forget where I came across this happy expression - and any renunciation of a pleasure he has once enjoyed comes hard to him. With the cheerful nonsense of his *Bierschwefel*,¹ for instance, the student tries to rescue his pleasure in freedom of thinking, of which he is being more and more deprived by the schooling of academic instruction. Much later still, indeed, when as a grown man he meets others in scientific congresses and once more feels himself a learner, after the meeting is over there comes the *Kneipzeitung*,² which distorts the new discoveries into nonsense, and offers him a compensation for the fresh addition to his intellectual inhibition.

¹ [*Bierschwefel*: ludicrous speech delivered at a beer party.]

² [A comic set of minutes. Literally, 'tavern newspaper'.]

The *Bierschwefel* and the *Kneipzeitung* give evidence by their names to the fact that the criticism which has repressed pleasure in nonsense has already grown so powerful that it cannot be put aside even temporarily without toxic assistance. A change in mood is the most precious thing that alcohol achieves for mankind, and on that account this 'poison' is not equally indispensable for everyone. A cheerful mood, whether it is produced endogenously or toxically, reduces the inhibiting forces, criticism among them, and makes accessible once again sources of pleasure which were under the weight of suppression. It is most instructive to observe how the standards of joking sink as spirits rise. For high spirits replace jokes, just as jokes must try to replace high spirits, in which possibilities of enjoyment which are otherwise inhibited - among them the pleasure in nonsense - can come into their own: 'Mit wenig Witz und viel Behagen.'¹ Under the influence of alcohol the grown man once more becomes a child, who finds pleasure in having the course of his thoughts freely at his disposal without paying regard to the compulsion of logic.

I hope I have now also shown that the absurdity-techniques of jokes are a source of pleasure. It need only be repeated that this pleasure arises from an economy in psychical expenditure or a relief from the compulsion of criticism.

If we look back once more at the three separate groups of joke-techniques, we see that the first and third of these groups - the replacement of thing-associations by word-associations and the use of absurdity - can be brought together as re-establishing old liberties and getting rid of the burden of intellectual upbringing; they are psychical reliefs, which can in a sense be contrasted with the economizing which constitutes the technique of the second group. Relief from psychical expenditure that is already there and economizing in psychical expenditure that is only about to be called for - from these two principles all the techniques of jokes, and accordingly all pleasure from these techniques, are derived. The two species of technique and of obtaining pleasure coincide - in the main at all events - with the distinction between verbal and conceptual jokes.

¹ ['With little wit and much enjoyment.']

The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.

Play - let us keep to that name - appears in children while they are learning to make use of words and to put thoughts together. This play probably obeys one of the instincts which compel children to practise their capacities (Groos). In doing so they come across pleasurable effects, which arise from a repetition of what is similar, a rediscovery of what is familiar, similarity of sound, etc., and which are to be explained as unsuspected economies in psychical expenditure. It is not to be wondered at that these pleasurable effects encourage children in the pursuit of play and cause them to continue it without regard for the meaning of words or the coherence of sentences. *Play* with words and thoughts, motivated by certain pleasurable effects of economy, would thus be the first stage of jokes.

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child's cheerfulness, lifts the critical inhibition. Only in such a case does the old game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.

And with this the second preliminary stage of jokes sets in - the *jest*. It is now a question of prolonging the yield of pleasure from play, but at the same time of silencing the objections raised by criticism which would not allow the pleasurable feeling to emerge. There is only one way of reaching this end: the meaningless combination of words or the absurd putting together of thoughts must nevertheless have a meaning. The whole ingenuity of the joke-work is summoned up in order to find words and aggregations of thoughts in which this condition is fulfilled. All the technical methods of jokes are already employed here - in jests; moreover linguistic usage draws no consistent line between a jest and a joke. What distinguishes a jest from a joke is that the meaning of the sentence which escapes criticism need not be valuable or new or even good; it need merely be *permissible* to say the thing in this way, even though it is unusual, unnecessary or useless to say it in this way. In jests what stands in the foreground is the satisfaction of having made possible what was forbidden by criticism.

It is, for instance, simply a jest when Schleiermacher defines *Eifersucht* [jealousy] as the *Leidenschaft* [passion] which *mit eifer Sucht* [with eagerness seeks] what *Leiden schafft* [causes pain]. It was a jest when Professor Kästner, who taught physics (and made jokes) at Göttingen in the eighteenth century, asked a student named Kriegk, when he was enrolling himself for his lectures, how old he was. 'Thirty years old' was the reply, whereupon Kästner remarked: 'Ah! so I have the honour of meeting the Thirty Years' War [*Krieg*].' (Kleinpaul, 1890.) It was with a jest that the great Rokitansky replied to the question of what were the professions of his four sons: 'Two *heilen* [heal] and two *heulen* [howl]' (two doctors and two singers). The information was correct and therefore not open to criticism; but it added nothing to what might have been expressed in the words in brackets. There can be no mistaking the fact that the answer was given the other form only on account of the pleasure which was produced by the unification and the similar sound of the two words.

I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes - and we must in a certain sense continue to describe them so - are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought-sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose and function of jokes, however - namely, the protection of sequences of words and thoughts from criticism - can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.

We are also in a position now to assign its correct place to the factor of 'sense in nonsense' (cf. the introduction, p. 1618), to which the authorities attribute such great importance as a distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed points in what determines the nature of jokes - their purpose of continuing pleasurable play and their effort to protect it from the criticism of reason immediately explain why an individual joke, though it may seem senseless from one point of view, must appear sensible, or at least allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect of jokes from the conflict between the feelings which arise (whether directly or along the path of 'bewilderment and enlightenment') from the simultaneous sense and nonsense of jokes. Nor have we any need to enter further into the question of how pleasure could arise from the alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of jokes has taught us that the pleasure in a joke is derived from play with words or from the liberation of nonsense, and that the meaning of the joke is merely intended to protect that pleasure from being done away with by criticism.

In this way the problem of the essential character of jokes is already explained in jests. We may now turn to the further development of jests, to the point at which they reach their height in tendentious jokes. Jests still give the foremost place to the purpose of giving us enjoyment, and are content if what they say does not appear senseless or completely devoid of substance. If what a jest says possesses substance and value, it turns into a joke. A thought which would deserve our interest even if it were expressed in the most unpretentious form is now clothed in a form which must give us enjoyment on its own account.¹ A combination like this can certainly not, we must suppose, have come about unintentionally; and we must try to discover the intention underlying the construction of the joke. An observation which we made earlier (in passing, as it seemed) will put us on the track. We said above (p. 1691) that a good joke makes, as it were, a *total* impression of enjoyment on us, without our being able to decide at once what share of the pleasure arises from its joking form and what share from its apt thought-content. We are constantly making mistakes in this apportionment. Sometimes we over-estimate the goodness of the joke on account of our admiration of the thought it contains; another time, on the contrary, we over-estimate the value of the thought on account of the enjoyment given us by its joking envelope. We do not know what is giving us enjoyment and what we are laughing at. This uncertainty in our judgement, which must be assumed to be a fact, may have provided the motive for the construction of jokes in the proper sense of the word. The thought seeks to wrap itself in a joke because in that way it recommends itself to our attention and can seem more significant and more valuable, but above all because this wrapping bribes our powers of criticism and confuses them. We are inclined to give the *thought* the benefit of what has pleased us in the *form* of the joke; and we are no longer inclined to find anything wrong that has given us enjoyment and so to spoil the source of a pleasure. If the joke has made us laugh, moreover, a disposition most unfavourable for criticism will have been established in us; for in that case something will have forced us into the mood which play has previously sufficed to produce, and for which the joke has tried by every possible means to make itself a substitute. Even though we have earlier asserted that such jokes are to be described as innocent and not yet tendentious, we must not forget that strictly speaking only jests are non-tendentious - that is, serve solely the aim of producing pleasure. Jokes, even if the thought contained in them is non-tendentious and thus only serves theoretical intellectual interests, are in fact never non-tendentious. They pursue the second aim: to promote the thought by augmenting it and guarding it against criticism. Here they are once again expressing their original nature by setting themselves up against an inhibiting and restricting power - which is now the critical judgement.

¹ As an example which shows the difference between a jest and a joke proper we may take the excellent joking remark with which a member of the 'Bürger' Ministry in Austria answered a question about the cabinet's solidarity: 'How can we *einstehen* [stand up] for one another if we can't *ausstehen* [stand] one another?' Technique: use of the same material with slight (contrary) modification. Logical and apposite thought: there can be no solidarity without mutual understanding. The contrary nature of the modification (*ein* [in] - *aus* [out]) corresponds to the incompatibility asserted in the thought and serves as a representation of it.

This, the first use of jokes that goes beyond the production of pleasure, points the way to their further uses. A joke is now seen to be a psychical factor possessed of power: its weight, thrown into one scale or the other, can be decisive. The major purposes and instincts of mental life employ it for their own ends. The originally non-tendentious joke, which began as play, is *secondarily* brought into relation with purposes from which nothing that takes form in the mind can ultimately keep away. We know already what it is able to achieve in the service of the purpose of exposure, and of hostile, cynical and sceptical purposes. In the case of obscene jokes, which are derived from smut, it turns the third person who originally interfered with the sexual situation into an ally, before whom the woman must feel shame, by bribing him with the gift of its yield of pleasure. In the case of aggressive purposes it employs the same method in order to turn the hearer, who was indifferent to begin with, into a co-hater or co-despiser, and creates for the enemy a host of opponents where at first there was only one. In the first case it overcomes the inhibitions of shame and respectability by means of the bonus of pleasure which it offers; in the second it upsets the critical judgement which would otherwise have examined the dispute. In the third and fourth cases, in the service of cynical and sceptical purposes, it shatters respect for institutions and truths in which the hearer has believed, on the one hand by reinforcing the argument, but on the other by practising a new species of attack. Where argument tries to draw the hearer's criticism over on to its side, the joke endeavours to push the criticism out of sight. There is no doubt that the joke has chosen the method which is psychologically the more effective.

In this survey of the achievements of tendentious jokes, most prominence has been assumed by - what is more easily seen - the effect of jokes on the person who hears them. More important, however, from the point of view of our understanding, are the functions accomplished by jokes in the mind of the person who makes them or, to put it in the only correct way, the person to whom they occur. We have already proposed - and here we have occasion to repeat the notion - that we should try to study the psychical phenomena of jokes with reference to their distribution between two people. We will make a provisional suggestion that the psychical process provoked by the joke in the hearer is in most cases modelled on that which occurs in its creator. The external obstacle which is to be overcome in the hearer corresponds to an internal inhibition in the maker of the joke. At the least the *expectation* of an external obstacle is present in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the tendentious joke is obvious; in Herr N.'s jokes, for instance, we were able to assume (p. 1699) that not only did they make it possible for their hearers to enjoy aggressiveness in the form of insults, but that above all they made it possible for him to produce them. Among the various kinds of internal inhibition or suppression there is one which deserves our special interest, because it is the most far-reaching. It is given the name of 'repression', and is recognized by its function of preventing the impulses subjected to it, and their derivatives, from becoming conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources that have undergone repression. If, as has been suggested above, the overcoming of external obstacles can in this way be traced back to the overcoming of internal inhibitions and repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work - that of liberating pleasure by getting rid of inhibitions more clearly than any other of the developmental stages of jokes. Either they strengthen the purposes which they serve, by bringing assistance to them from impulses that are kept suppressed, or they put themselves entirely at the service of suppressed purposes.

We may be ready to admit that this is what tendentious jokes achieve; yet we must bear in mind that we do not understand how they are able to put these achievements into effect. Their power lies in the yield of pleasure which they draw from the sources of play upon words and of liberated nonsense; but if we are to judge by the impressions gained from non-tendentious jests, we cannot possibly think the amount of this pleasure great enough to attribute to it the strength to lift deeply-rooted inhibitions and repressions. What we have before us here is in fact no simple effect of force but a more complex situation of release. Instead of setting out the long detour by which I reached an understanding of this situation, I will try to give a short synthetic exposition of it.

Fechner (1897, 1, Chapter V) has put forward a 'principle of aesthetic assistance or intensification', which he has expressed as follows: *'If determinants of pleasure that in themselves produce little effect converge without mutual contradiction, there results a greater, and often a much greater, outcome of pleasure than corresponds to the pleasure-value of the separate determinants - a greater pleasure than could be explained as the sum of the separate effects. Indeed, a convergence of this kind can even lead to a positive resultant of pleasure and the threshold of pleasure may be crossed, where the separate factors are too weak to do so: though they must, in comparison with others, show a perceptible advantage in enjoyableness.'* (Ibid., 51. The italics are Fechner's.)

The topic of jokes does not, I think, give us much opportunity of confirming the correctness of this principle, which can be shown to hold good in many other aesthetic structures. As regards jokes we have learnt something else, which at least fringes upon this principle: namely, that where several pleasure-giving factors operate together we are not able to attribute to each of them the share it has really taken in bringing about the result. (p. 1691.) We can, however, vary the situation that is assumed in the 'principle of assistance' and, as a result of these fresh conditions, arrive at a number of questions which would deserve reply. What happens in general if, in a combination, determinants of pleasure and determinants of unpleasure converge? On what does the outcome depend and what decides whether that outcome is in pleasure or unpleasure?

The case of tendentious jokes is a special one among these possibilities. An impulse or urge is present which seeks to release pleasure from a particular source and, if it were allowed free play, would release it. Besides this, another urge is present which works against this generation of pleasure - inhibits it, that is, or suppresses it. The suppressing current must, as the outcome shows, be a certain amount stronger than the suppressed one, which, however, is not on that account abolished. Now let us suppose that yet another urge makes its appearance which would release pleasure through the same process, though from other sources, and which thus operates in the same sense as the suppressed urge. What can the result be in such a case?

An example will give us our bearings better than this schematic discussion. Let us assume that there is an urge to insult a certain person; but this is so strongly opposed by feelings of propriety or of aesthetic culture that the insult cannot take place. If, for instance, it were able to break through as a result of some change of emotional condition or mood, this break through by the insulting purpose would be felt subsequently with unpleasure. Thus the insult does not take place. Let us now suppose, however, that the possibility is presented of deriving a good joke from the material of the words and thoughts used for the insult - the possibility, that is, of releasing pleasure from other sources which are not obstructed by the same suppression. This second development of pleasure could, nevertheless, not occur unless the insult were permitted; but as soon as the latter is permitted the new release of pleasure is also joined to it. Experience with tendentious jokes shows that in such circumstances the suppressed purpose can, with the assistance of the pleasure from the joke, gain sufficient strength to overcome the inhibition, which would otherwise be stronger than it. The insult takes place, because the joke is thus made possible. But the enjoyment obtained is not only that produced by the joke: it is incomparably greater. It is so much greater than the pleasure from the joke that we must suppose that the hitherto suppressed purpose has succeeded in making its way through, perhaps without any diminution whatever. It is in such circumstances that the tendentious joke is received with the heartiest laughter.

An examination of the determinants of laughing will perhaps lead us to a plainer idea of what happens when a joke affords assistance against suppression. Even now, however, we can see that the case of tendentious jokes is a special case of the 'principle of assistance'. A possibility of generating pleasure supervenes in a situation in which another possibility of pleasure is obstructed so that, as far as the latter alone is concerned, no pleasure would arise. The result is a generation of pleasure far greater than that offered by the supervening possibility. This has acted, as it were, as an *incentive bonus* with the assistance of the offer of a small amount of pleasure, a much greater one, which would otherwise have been hard to achieve, has been gained. I have good reason to suspect that this principle corresponds with an arrangement that holds good in many widely separated departments of mental life and it will, I think, be expedient to describe the pleasure that serves to initiate the large release of pleasure as 'fore-pleasure', and the principle as the 'fore-pleasure principle'.

We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression - these are the forces against which it fights in succession; it holds fast to the original sources of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.¹

¹ Nonsense jokes, which have not had due attention paid to them in my account, deserve some supplementary consideration.

The importance which our views attach to the factor of 'sense in nonsense' might lead to a demand that every joke must be a nonsense joke. But this is not necessary, because it is only playing with *thoughts* that inevitably leads to nonsense; the other source of pleasure in jokes, playing with *words*, only gives that impression occasionally and does not invariably provoke the implied criticism. The twofold root of the pleasure in jokes - from playing with words and playing with thoughts, which corresponds to the very important distinction between verbal and conceptual jokes - makes it perceptibly more difficult to arrive at a concise formulation of general statements about jokes. Playing with words produces manifest pleasure as a result of the factors that have been enumerated above (recognition, and so on), and is consequently only to a small degree liable to suppression. Playing with thoughts cannot have its motive in this kind of pleasure; it meets with very energetic suppression, and the pleasure which it can yield is only pleasure in the lifting of an inhibition. It can accordingly be said that the pleasure in jokes exhibits a core of original pleasure in play and a casing of pleasure in lifting inhibitions. - We naturally do not perceive that our pleasure in a nonsense joke arises from our having succeeded in liberating a piece of nonsense in spite of its suppression; whereas we see directly that playing with words has given us pleasure. - The nonsense that still remains in a conceptual joke acquires secondarily the function of increasing our attention by bewildering us. It serves as a means of intensifying the effect of the joke, but only when it acts obtrusively, so that the bewilderment can hurry ahead of the understanding by a perceptible moment of time. The examples on p. 1659 ff. have shown that in addition to this, nonsense in a joke can be used to represent a judgement contained in the thought. But this, too, is not the primary significance of nonsense in jokes.

[Added 1912:] A number of productions resembling jokes can be classed alongside of nonsense jokes. There is no appropriate name for them, but they might well be described as 'idiocy masquerading as a joke'. There are countless numbers of them, and I will only select two samples:

'A man at the dinner table who was being handed fish dipped his two hands twice in the mayonnaise and then ran them through his hair. When his neighbour looked at him in astonishment, he seemed to notice his mistake and apologized: "I'm so sorry, I thought it was spinach."'

Or: "Life is a suspension bridge", said one man. - "Why is that?" asked the other. - "How should I know?" was the reply.'

These extreme examples have an effect because they rouse the expectation of a joke, so that one tries to find a concealed sense behind the nonsense. But one finds none: they really are nonsense. The pretence makes it possible for a moment to liberate the pleasure in nonsense. These jokes are not entirely without a purpose; they are a 'take-in', and give the person who tells them a certain amount of pleasure in misleading and annoying his hearer. The latter then damps down his annoyance by determining to tell them himself later on.

V

THE MOTIVES OF JOKES - JOKES AS A SOCIAL PROCESS

It might seem superfluous to talk about the motives of jokes, since the aim of getting pleasure must be recognized as a sufficient motive for the joke-work. But on the one hand the possibility cannot be excluded of other motives as well having a share in the production of jokes, and on the other hand, bearing in mind some familiar experiences, we must raise the general question of the subjective determinants of jokes.

Two facts in particular make this necessary. Although the joke-work is an excellent method of getting pleasure out of psychical processes, it is nevertheless evident that not everyone is equally capable of making use of that method, the joke-work is not at everyone's command, and altogether only a few people have a plentiful amount of it; and these are distinguished by being spoken of as having 'wit' [*Witz*]. 'Wit' appears in this connection as a special capacity - rather in the class of the old mental 'faculties'; and it seems to emerge fairly independently of the others, such as intelligence, imagination, memory, etc. We must therefore presume the presence in these 'witty' people of special inherited dispositions or psychical determinants which permit or favour the joke-work.

I fear that we shall not get very far in exploring this question. We can only succeed here and there in advancing from an understanding of a particular joke to a knowledge of the subjective determinants in the mind of the person who made it. It is a remarkable coincidence that precisely the example of the joke on which we began our investigations of the technique of jokes also gives us a glimpse into the subjective determinants of jokes. I refer to Heine's joke, which has also been considered by Heymans and Lipps:

'... I sat beside Salomon Rothschild and he treated me quite as his equal - quite famillionairely.' ('Bäder von Lucca.')

Heine puts this remark into the mouth of a comic character, Hirsch-Hyacinth, a Hamburg lottery-agent, extractor of corns and professional valuer, the valet of the aristocratic Baron Gristoforo Gumpelino (formerly Gumpel). The poet evidently takes the greatest satisfaction in this creation of his, for he makes Hirsch-Hyacinth into a great talker and gives him the most amusing and plain-spoken speeches, and even lets him display the practical philosophy of a Sancho Panza. It is a pity that Heine, who seems to have had no taste for dramatic construction, dropped this delightful character so soon. There are not a few passages in which the poet himself seems to be speaking, under a thing disguise, through the mouth of Hirsch-Hyacinth, and it soon becomes a certainty that this character is only a self-parody. Hirsch explains his reasons for having given up his former name and why he now calls himself 'Hyacinth'. He goes on: 'There's the further advantage that I already have an "H" on my signet, so that I don't need to have a new one cut.' But Heine himself effected the same economy when, at his baptism, he changed his first name from 'Harry' to 'Heinrich'. Everyone, too, who is familiar with the poet's biography, will recall that Heine had an uncle of the same name in Hamburg (a place which provides another connection with the figure of Hirsch-Hyacinth) who, as the rich man of the family, played a large part in his life. This uncle was also called 'Salomon', just like the old Rothschild who treated Hirsch so famillionairely. What seemed in Hirsch-Hyacinth's mouth no more than a jest soon reveals a background of serious bitterness if we ascribe it to the nephew, Harry-Heinrich. After all, he was one of the family, and we know that he had a burning wish to marry a daughter of this uncle's; but his cousin rejected him, and his uncle always treated him a little famillionairely, as a poor relation. His rich cousins in Hamburg never took him seriously. I recall a story told by an old aunt of my own, who had married into the Heine family, how one day, when she was an attractive young woman, she found sitting next her at the family dinner-table a person who struck her as uninviting and whom the rest of the company treated contemptuously. She herself felt no reason to be any more affable towards him. It was only many years later that she realized that this negligent and neglected cousin had been the poet Heinrich Heine. There is not a little evidence to show how much Heine suffered both in his youth and later from this rejection by his rich relations. It was from the soil of this subjective emotion that the 'famillionairely' joke sprang.

The presence of similar subjective determinants may be suspected in some other of the great scoffer's jokes; but I know of no other one in which this can be demonstrated so convincingly. For this reason it is not easy to try to make any more definite statement about the nature of these personal determinants. Indeed, we shall be disinclined in general to claim such complicated determinants for the origin of every individual joke. Nor are the jokes produced by other famous men any more easily accessible to our examination. We get an impression that the subjective determinants of the joke-work are often not far removed from those of neurotic illness - when we learn, for instance, of Lichtenberg that he was a severely hypochondriacal man, with all kinds of eccentricities. The great majority of jokes, and especially those that are constantly being newly produced in connection with the events of the day, are circulated anonymously; one would be curious to learn from what sort of people such productions originate. If one has occasion as doctor to make the acquaintance of one of those people who, though not remarkable in other ways, are well known in their circle as jokers and the originators of many viable jokes, one may be surprised to discover that the joker is a disunited personality, disposed to neurotic disorders. The insufficiency of documentary evidence, however, will certainly prevent our setting up a hypothesis that a psychoneurotic constitution of this kind is a habitual or necessary subjective condition for the construction of jokes.

A more transparent case is offered, once more, by the Jewish jokes, which, as I have already mentioned (p. 1705), are ordinarily made by Jews themselves, while the anecdotes about them from other sources scarcely ever rise above the level of comic stories or of brutal derision. What determines their participating in the jokes themselves seems to be the same as in the case of Heine's 'famillionairely' joke; and its significance seems to lie in the fact that the person concerned finds criticism or aggressiveness difficult so long as they are direct, and possible only along circuitous paths.

Other subjective factors which determine or favour the joke-work are less wrapped in obscurity. The motive force for the production of innocent jokes is not infrequently an ambitious urge to show one's cleverness, to display oneself - an instinct that may be equated with exhibitionism in the sexual field. The presence of numerous inhibited instincts, whose suppression has retained a certain degree of instability, will provide the most favourable disposition for the production of tendentious jokes. Thus individual components of a person's sexual constitution in particular, can appear as motives for the construction of a joke. A whole class of obscene jokes allows one to infer the presence of a concealed inclination to exhibitionism in their inventors; aggressive tendentious jokes succeed best in people in whose sexuality a powerful sadistic component is demonstrable, which is more or less inhibited in real life.

The second fact which makes an enquiry into the subjective determination of jokes necessary is the generally recognized experience that no one can be content with having made a joke for himself alone. An urge to tell the joke to someone is inextricably bound up with the joke-work; indeed, this urge is so strong that often enough it is carried through in disregard of serious misgivings. In the case of the comic as well, telling it to someone else produces enjoyment; but the demand is not peremptory. If one comes across something comic, one can enjoy it by oneself. A joke, on the contrary, *must* be told to someone else. The psychical process of constructing a joke seems not to be completed when the joke occurs to one: something remains over which seeks, by communicating the idea, to bring the unknown process of constructing the joke to a conclusion.

We cannot in the first instance guess what the basis may be of this urge to communicate the joke. But we can see another peculiarity in jokes which distinguishes them from the comic. If I come across something comic, I myself can laugh heartily at it, though it is true that I am also pleased if I can make someone else laugh by telling it to him. But I myself cannot laugh at a *joke* that has occurred to me, that I have made, in spite of the unmistakable enjoyment that the joke gives me. It is possible that my need to communicate the joke to someone else is in some way connected with the laughter produced by it, which is denied to me but is manifest in the other person.

Why is it, then, that I do not laugh at a joke of my own? And what part is played in this by the other person?

Let us take the second question first. In the case of the comic, two persons are in general concerned: besides myself, the person in whom I find something comic. If inanimate things seem to me comic, that is on account of a kind of personification which is not of rare occurrence in our ideational life. The comic process is content with these two persons: the self and the person who is the object; a third person may come into it, but is not essential. Joking as a *play* with one's own words and thoughts is to begin with without a person as an object. But already at the preliminary stage of the *jest*, if it has succeeded in making play and nonsense safe from the protests of reason, it demands another person to whom it can communicate its result. But this second person in the case of jokes does not correspond to the person who is the object, but to the *third* person, the 'other' person in the case of the comic. It seems as though in the case of a *jest* the other person has the decision passed over to him on whether the joke-work has succeeded in its task - as though the self did not feel certain in its judgement on the point. Innocent jokes, too, jokes that serve to reinforce a thought, require another person to test whether they have attained their aim. If a joke enters the service of the purpose of exposing or of a hostile purpose, it may be described as a psychical process between three persons, who are the same as in the case of the comic, though the part played by the third person is different; the psychical process in jokes is accomplished between the first person (the self) and the third (the outside person) and not, as in the case of the comic, between the self and the person who is the object.

Jokes are confronted by subjective determinants in the case of the third person too, and these may make their aim of producing pleasurable excitation unattainable. As Shakespeare (*Love's Labour Lost*, V, 2) reminds us:

A jest's prosperity lies in the ear
Of him that hears it, never in the tongue
Of him that makes it . . .

A person who is dominated by a mood concerned with serious thoughts is not fitted to confirm the fact that a jest has succeeded in rescuing the verbal pleasure. He must himself be in a cheerful or at least in an indifferent state of feeling in order to act as the jest's third person. The same obstacle applies to innocent and to tendentious jokes; but in the latter there is a further obstacle in the form of opposition to the purpose which the joke is trying to serve. The third person cannot be ready to laugh at an excellent obscene joke if the exposure applies to a highly respected relative of his own; before a gathering of priests and ministers no one would venture to produce Heine's comparison of catholic and protestant clerics to retail tradesmen and employees of a wholesale business; and an audience composed of my opponent's devoted friends would receive my most successful pieces of joking invective against him not as jokes but as invective, and would meet them with indignation and not with pleasure. Some degree of benevolence or a kind of neutrality, an absence of any factor that could provoke feelings opposed to the purpose of the joke, is an indispensable condition if the third person is to collaborate in the completion of the process of making the joke.

Where there are no such obstacles to the operation of the joke, the phenomenon which is now the subject of our enquiry emerges: the pleasure which the joke has produced is more evident in the third person than in the creator of the joke. We must be content to say more '*evident*' where we should be inclined to ask whether the hearer's pleasure is not more '*intense*' than that of the maker of the joke, since we naturally have no means of measuring and comparing. We see, however, that the hearer gives evidence of his pleasure with a burst of laughter, after the first person has as a rule produced the joke with a tensely serious look. If I repeat a joke that I have heard myself, I must, if I am not to spoil its effect, behave in telling it exactly like the person who made it. The question now arises whether we can draw any conclusions about the psychical process of constructing jokes from this factor of laughing at jokes.

It cannot be our design to consider at this point all that has been propounded and published on the nature of laughter. We may well be deterred from any such plan by the remarks with which Dugas, a pupil of Ribot's, prefaces his book *La psychologie du rire* (1902, 1): 'Il n'est pas de fait plus banal et plus étudié que le rire; il n'en est pas qui ait eu le don d'exciter davantage la curiosité du vulgaire et celle des philosophes; il n'en est pas sur lequel on ait recueilli plus d'observations et bâti plus de théories, et avec cela il n'en est pas qui demeure plus inexpliqué. On serait tenté de dire avec les sceptiques qu'il faut être content de rire et de ne pas chercher à savoir pourquoi on rit, d'autant que peut-être la réflexion tue le rire, et qu'il serait alors contradictoire qu'elle en découvrit les causes.'¹

¹ ['There is no action that is more commonplace or that has been more widely studied than laughter. There is none that has succeeded more in exciting the curiosity both of ordinary people and of philosophers. There is none on which more observations have been collected and more theories built. But at the same time there is none that remains more unexplained. It would be tempting to say with the sceptics that we must be content to laugh and not try to know why we laugh, since it may be that reflection kills laughter and it would thus be a contradiction to think that it could discover its causes.']

On the other hand we shall not miss the opportunity of making use for our purposes of an opinion on the mechanism of laughter which fits in excellently with our own line of thought. I have in mind the attempt at an explanation made by Herbert Spencer in his essay on 'The Physiology of Laughter' (1860). According to Spencer, laughter is a phenomenon of the discharge of mental excitation and a proof that the psychical employment of this excitation has suddenly come up against an obstacle. He describes the psychological situation which ends in laughter in the following words: 'Laughter naturally results only when consciousness is unawares transferred from great things to small - only when there is what we may call a *descending* incongruity.'¹

¹ Various points in this definition would call for detailed examination in an investigation of comic pleasure; this has already been undertaken by other authors and in any case does not concern us here. - I do not think Spencer has been happy in his explanation of why the discharge takes the particular paths whose excitation produces the somatic picture of laughter. The theme of the physiological explanation of laughter - that is, the tracing back or interpretation of the muscular actions characteristic of laughter - has been treated at length both before and since Darwin, but has still not been finally cleared up. I have one contribution to make to this theme. So far as I know, the grimace characteristic of smiling, which twists up the corners of the mouth, appears first in an infant at the breast when it is satisfied and satiated and lets go of the breast as it falls asleep. Here it is a genuine expression of the emotions, for it corresponds to a decision to take no more nourishment, and represents as it were an 'enough' or rather a 'more than enough'. This original meaning of pleasurable satiety may have brought the smile, which is after all the basic phenomenon of laughter, into its later relation with pleasurable processes of discharge.

In a quite similar sense French authors (e.g. Dugas) describe laughter as a '*détente*', a phenomenon of relaxation of tension. So too the formula proposed by Bain - 'laughter a release from constraint' - seems to me to diverge from Spencer's view much less than some authorities would have us believe.

Nevertheless, we feel a need to modify Spencer's notion, in part to give a more definite form to the ideas contained in it and in part to change them. We should say that laughter arises if a quota of psychical energy which has earlier been used for the cathexis of particular psychical paths has become unusable, so that it can find free discharge. We are well aware what 'evil looks' we are inviting with such a hypothesis; but we will venture to quote in our defence an apposite sentence from Lipps's book *Komik und Humor* (1898, 71), from which illumination is to be derived on more subjects than that of the comic and humour: 'Finally, specific psychological problems always lead fairly deep into psychology, so that at bottom no psychological problem can be treated in isolation.' The concepts of 'psychical energy' and 'discharge' and the treatment of psychical energy as a quantity have become habitual in my thoughts since I began to arrange the facts of psychopathology philosophically; and already in my *Interpretation of Dreams* (1900a) I tried (in the same sense as Lipps) to establish the fact that what are 'really psychically effective' are psychical processes which are unconscious in themselves, not the contents of consciousness.¹ It is only when I speak of the 'cathexis of psychical paths' that I seem to depart from the analogies commonly used by Lipps. My experiences of the displaceability of psychical energy along certain paths of association, and of the almost indestructible persistence of the traces of psychical processes, have in fact suggested to me an attempt at picturing the unknown in some such way. To avoid misunderstanding, I must add that I am making no attempt to proclaim that the cells and nerve fibres, or the systems of neurones which are taking their place to-day, are these psychical paths, even though it would have to be possible in some manner which cannot yet be indicated to represent such paths by organic elements of the nervous system.

¹ Cf. the sections 'On Psychical Force', etc. in Chapter VIII of Lipps's book quoted above. 'Thus the following general statement holds good: The factors of psychical life are not the contents of consciousness but the psychical processes which are in themselves unconscious. The task of psychology, if it does not merely wish to describe the contents of consciousness, must therefore consist in inferring the nature of these unconscious processes from the character of the contents of consciousness and their temporal connections. Psychology must be a theory of these processes. But a psychology of this kind will very soon find that there are quite a number of characteristics of these processes which are not represented in the corresponding contents of consciousness.' (Lipps, *ibid.*, 123-4.) See also Chapter VII of my *Interpretation of Dreams*.

In laughter, therefore, on our hypothesis, the conditions are present under which a sum of psychical energy which has hitherto been used for cathexis is allowed free discharge. And since laughter - not all laughter, it is true, but certainly laughter at a joke - is an indication of pleasure, we shall be inclined to relate this pleasure to the lifting of the cathexis which has previously been present. If we see that the hearer of a joke laughs but that its creator cannot laugh, this may amount to telling us that in the hearer a cathectic expenditure has been lifted and discharged, while in the construction of the joke there have been obstacles either to the lifting or to the possibility of discharge. The psychical process in the hearer, the joke's third person, can scarcely be more aptly described than by stressing the fact that he has bought the pleasure of the joke with very small expenditure on his own part. He might be said to have been presented with it. The words of the joke he hears necessarily bring about in him the idea or train of thought to the construction of which great internal inhibitions were opposed in him too. He would have had to make an effort of his own in order to bring it about spontaneously as the first person, he would have had to use at least as much psychical expenditure on doing so as would correspond to the strength of the inhibition, suppression or repression of the idea. He has saved this psychical expenditure. On the basis of our earlier discussions (p. 1711) we should say that his pleasure corresponds to this economy. Our insight into the mechanism of laughter leads us rather to say that, owing to the introduction of the proscribed idea by means of an auditory perception, the cathectic energy used for the inhibition has now suddenly become superfluous and has been lifted, and is therefore now ready to be discharged by laughter. The two ways of expressing the facts amount to the same thing in essentials, since the expenditure economized corresponds exactly to the inhibition that has become superfluous. But the second method of expression is the more illuminating, since it allows us to say that the hearer of the joke laughs with the quota of psychical energy which has become free through the lifting of the inhibitory cathexis; we might say that he laughs this quota off.

If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathectic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of *further* inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition - an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we have been more successful in throwing light on one part of our problem - on why the third person laughs - than on its other part - on why the first person does *not* laugh.

Nevertheless, if we firmly accept these views on the determinants of laughter and on the psychical process in the third person, we are now in a position to give a satisfactory explanation of a whole number of peculiarities which jokes have been known to possess but which have not been understood. If a quota of cathectic energy capable of discharge is to be liberated in the third person, there are several conditions which must be fulfilled or which are desirable in order to act as encouragements: (1) It must be ensured that the third person is really making this cathectic expenditure. (2) It is necessary to guard against the cathectic expenditure, when it is liberated, finding some other psychical use instead of offering itself for motor discharge. (3) It cannot but be an advantage if the cathexis which is to be liberated in the third person is intensified before hand, raised to a greater height. All these aims are served by particular methods of the joke-work, which may be classed together as secondary or auxiliary techniques:-

The first of these conditions lays down one of the necessary qualifications of the third person as hearer of the joke. It is essential that he should be in sufficient psychical accord with the first person to possess the same internal inhibitions, which the joke-work has overcome in the latter. A person who is responsive to smut will be unable to derive any pleasure from witty jokes of exposure; Herr N.'s attacks will not be understood by uneducated people who are accustomed to give free play to their desire to insult. Thus every joke calls for a public of its own and laughing at the same jokes is evidence of far reaching psychical conformity. Here moreover we have arrived at a point which enables us to guess still more precisely what takes place in the third person. He must be able as a matter of habit to erect in himself the same inhibition which the first person's joke has overcome, so that, as soon as he hears the joke, the readiness for this inhibition will compulsively or automatically awaken. This readiness for inhibition, which I must regard as a real expenditure, analogous to mobilization in military affairs, will at the same moment be recognized as superfluous or too late, and so be discharged *in statu nascendi* by laughter.¹

The second condition for making free discharge possible - that the liberated energy shall be prevented from being used in any other way - seems very much the more important. It provides the theoretical explanation of the uncertainty of the effect of jokes when the thoughts expressed in a joke arouse powerfully exciting ideas in the hearer; in that case the question whether the purposes of the joke agree with or contradict the circle of thoughts by which the hearer is dominated will decide whether his attention will remain with the joking process or be withdrawn from it. Of still greater theoretical interest, however, are a class of auxiliary techniques which clearly serve the end of entirely detaching the hearer's attention from the joking process, and of allowing that process to run its course automatically. I deliberately say 'automatically' and not 'unconsciously', because the latter description would be misleading. It is only a question here of holding back an increased cathexis of attention from the psychical process when the joke is heard; and the usefulness of these auxiliary techniques rightly leads us to suspect that precisely the cathexis of attention has a great share in the supervision and fresh employment of liberated cathectic energy.

¹ The notion of the *status nascendi* has been used by Heymans (1896) in a somewhat different connection.

It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke's form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke's wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a *comic* façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.¹

¹ I should like to discuss yet another interesting characteristic of joke-technique, in connection with an example of a displacement joke. Once when Gallmeyer, that actress of genius, was asked the unwelcome question 'Your age?' she is said to have replied 'in the tone of voice of a Gretchen and with her eyes bashfully cast down: "at Brünn".' This is a model displacement. When she was asked her age she replied by giving the place of her birth. She was thus anticipating the next question and was letting it be understood that she would be glad to know that this one question had been passed over. Yet we feel that in this instance the characteristic of jokes is not expressed in all its purity. It is too clear that the question is being evaded, the displacement is too obvious. Our attention understands at once that what is in question is an intentional displacement. In the other displacement jokes the displacement is disguised; our attention is held by the effort to detect it. In the displacement joke recorded on p. 1658, in the reply made to a recommendation of a riding horse 'What should I be doing in Pressburg at half-past six?' the displacement is also prominent. But to make up for this it has a confusing effect on the attention through its nonsensical nature, whereas in the actress's examination we are able to recognize her displacement-reply immediately. - [Added 1912] What are known as '*Scherzfragen* [facetious questions]' deviate from jokes in another direction, though apart from this they may make use of the best techniques. Here is an example of one of them, which uses the technique of displacement: 'What is a cannibal who has eaten his father and his mother?' - 'An orphan.' - 'And if he, has eaten all his other relations as well?' - 'The sole heir.' - 'And where will a monster of that kind find sympathy?' - 'In the dictionary under "S".' 'Facetious questions' of this kind are not proper jokes because the joking answers that they call for cannot be guessed in the same way as are the allusions, omissions, etc. of jokes.

As we can already guess, and as we shall see more clearly later on, we have discovered in the condition of distracting the attention a by no means unessential feature of the psychical process in the hearer of a joke. In connection with this there are still other things that we can understand. Firstly, there is the question why we scarcely ever know what we are laughing at in a joke, though we can discover it by an analytic investigation. The laughter is in fact the product of an automatic process which is only made possible by our conscious attention's being kept away from it. Secondly, we are able to understand the peculiar fact about jokes that they only produce their full effect on the hearer if they are new to him, if they come as a surprise to him. This characteristic of jokes (which determines the shortness of their life and stimulates the constant production of new jokes) is evidently due to the fact that the very nature of surprising someone or taking him unawares implies that it cannot succeed a second time. When a joke is repeated, the attention is led back to the first occasion of hearing it as the memory of it arises. And from this we are carried on to an understanding of the urge to tell a joke one has heard to other people who have not yet heard it. One probably recovers from the impression the joke makes on a new-comer some of the possibility of enjoyment that has been lost owing to its lack of novelty. And it may be that it was an analogous motive that drove the creator of the joke in the first instance to tell it to someone else.

In the third place I shall bring forward - but this time not as necessary conditions but only as encouragements to the process of joking - the auxiliary technical methods of the joke-work which are calculated to increase the quota which obtains discharge and in that way intensify the effect of the joke. These, it is true, also for the most part increase the attention that is paid to the joke, but they make this effect innocuous once more by simultaneously holding it and inhibiting its mobility. Anything that provokes interest and bewilderment works in these two directions - thus, in particular, nonsense, and contradiction, too, the 'contrast of ideas' which some authorities have tried to make into the essential characteristic of jokes, but which I can only regard as a means of intensifying their effect. Anything that bewilders calls up in the hearer the state of distribution of energy which Lipps has called 'psychical damming up'; and he is no doubt also correct in supposing that the discharge is the more powerful, the higher was the preceding damming up. Lipps's account, it is true, does not relate specifically to jokes but to the comic in general; but we may regard it as most probable that in jokes, too, the discharge of an inhibitory cathexis is similarly increased by the height of the damming up.

It now begins to dawn on us that the technique of jokes is in general determined by two sorts of purposes - those that make the construction of the joke possible in the first person and those that are intended to guarantee the joke the greatest possible pleasurable effect on the third person. The Janus-like, two-way-facing character of jokes, which protects their original yield of pleasure from the attacks of critical reason, and the mechanism of fore-pleasure belong to the first of these purposes; the further complication of the technique by the conditions that have been enumerated in the present chapter takes place out of regard for the joke's third person. A joke is thus a double-dealing rascal who serves two masters at once. Everything in jokes that is aimed at gaining pleasure is calculated with an eye to the third person, as though there were internal and unsurmountable obstacles to it in the first person. And this gives us a full impression of how indispensable this third person is for the completion of the joking process. But whereas we have been able to obtain a fairly good insight into the nature of this process in the third person, the corresponding process in the first person seems still to be veiled in obscurity. Of the two questions we asked, 'Why are we unable to laugh at a joke we have made ourselves?' and 'Why are we driven to tell our own joke to someone else?', the first has so far evaded our reply. We can only suspect that there is an intimate connection between the two facts that have to be explained: that we are compelled to tell our joke to someone else *because* we are unable to laugh at it ourselves. Our insight into the conditions for obtaining and discharging pleasure which prevail in the *third* person enables us to infer as regards the *first* person that in him the conditions for discharge are lacking and those for obtaining pleasure only incompletely fulfilled. That being so, it cannot be disputed that we supplement our pleasure by attaining the laughter that is impossible for us by the roundabout path of the impression we have of the person who has been made to laugh. As Dugas has put it, we laugh as it were '*par ricochet* [on the rebound]'. Laughter is among the highly infectious expressions of psychical states. When I make the other person laugh by telling him my joke, I am actually making use of him to arouse my own laughter; and one can in fact observe that a person who has begun by telling a joke with a serious face afterwards joins in the other person's laughter with a moderate laugh. Accordingly, telling my joke to another person would seem to serve several purposes: first, to give me objective certainty that the joke-work has been successful; secondly, to complete my own pleasure by a reaction from the other person upon myself; and thirdly - where it is a question of repeating a joke that one has not produced oneself - to make up for the loss of pleasure owing to the joke's lack of novelty.

At the conclusion of these discussions of the psychical processes in jokes in so far as they take place between two persons, we may glance back at the factor of economy, which has been in our mind as being of importance in arriving at a psychological view of jokes ever since our first explanation of their technique. We have long since abandoned the most obvious but simplest view of this economy - that it is a question of an avoidance of psychical expenditure in general, such as would be involved by the greatest possible restriction in the use of words and in the establishment of chains of thought. Even at that stage we told ourselves that being concise or laconic was not enough to make a joke. A joke's brevity is of a peculiar kind - 'joking' brevity. It is true that the original yield of pleasure, produced by playing with words and thoughts, was derived from mere economy in expenditure; but with the development of play into a joke the tendency to economy too must alter its aims, for the amount that would be saved by the use of the same word or the avoidance of a new way of joining ideas together would certainly count for nothing as compared with the immense expenditure on our intellectual activity. I may perhaps venture on a comparison between psychical economy and a business enterprise. So long as the turnover in the business is very small, the important thing is that outlay in general shall be kept low and administrative costs restricted to the minimum. Economy is concerned with the absolute height of expenditure. Later, when the business has expanded, the importance of the administrative cost diminishes; the height reached by the amount of expenditure is no longer of significance provided that the turnover and profits can be sufficiently increased. It would be niggling, and indeed positively detrimental, to be conservative over expenditure on the administration of the business. Nevertheless it would be wrong to assume that when expenditure was absolutely great there would be no room left for the tendency to economy. The mind of the manager, if it is inclined to economy, will now turn to economy over details. He will feel satisfaction if a piece of work can be carried out at smaller cost than previously, however small the saving may seem to be in comparison with the size of the total expenditure. In a quite analogous fashion, in our complex psychical business too, economy in detail remains a source of pleasure, as may be seen from everyday happenings. Anyone who used to have his room lighted by gas and has now had electricity installed will for quite a time be aware of a definite feeling of pleasure when he switches on the electric light; he will feel it as long as the memory is revived in him at that moment of the complicated manoeuvres that were necessary for lighting the gas. Similarly, the economies in psychical inhibitory expenditure brought about by a joke - though they are small in comparison with our total psychical expenditure - will remain a source of pleasure for us because they save us a particular expenditure which we have been accustomed to make and which we were already prepared to make on this occasion as well. The factor of the expenditure's being one that was expected and prepared for moves unmistakably into the foreground.

A localized economy, such as we have just been considering, will not fail to give us momentary pleasure; but it will not bring a lasting relief so long as what has been saved at this point can be put to use elsewhere. It is only if this disposal elsewhere can be avoided that this specialized economy is transformed into a general relief of psychical expenditure. Thus, as we come to a better understanding of the psychical processes of jokes, the factor of relief takes the place of economy. It is obvious that the former gives a greater feeling of pleasure. The process in the joke's first person produces pleasure by lifting inhibition and diminishing local expenditure; but it seems not to come to rest until, through the intermediary of the interpolated third person, it achieves general relief through discharge.

C. THEORETIC PART

VI

THE RELATION OF JOKES TO DREAMS AND TO THE UNCONSCIOUS

At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 1686 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the 'dream-work'. I further promised on the one hand that we would study these similarities more closely and on the other hand that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison - the 'dream-work' - was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my *Interpretation of Dreams*, published in 1900, provoked more 'bewilderment' than 'enlightenment' among my fellow-specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catch-word ('wish-fulfilment') which can be easily remembered and conveniently misused.

Continued concern with the problems treated there - for which my medical practice as a psychotherapist has given me abundant opportunity - has not brought me up against anything that might have called for alterations or improvements in my lines of thought; I can therefore wait quietly till my readers' understanding catches up with me or till judicious criticism has shown me the fundamental errors in my view. For the purpose of making the comparison with jokes, I will now repeat, briefly and concisely, the most essential information about dreams and the dream-work.

We know a dream from what seems as a rule a fragmentary memory of it which we have after waking. It appears as a mesh-work of sense-impressions, mostly visual but also of other kinds, which have simulated an experience, and with which thought-processes ('knowledge' in the dream) and expressions of affect may be mingled. What we thus remember of the dream I call '*the dream's manifest content*'. It is often entirely absurd and confused - sometimes only the one or the other. But even if it is quite coherent, as it is in the case of some anxiety-dreams, it confronts our mental life as something alien, for whose origin one cannot in any way account. The explanation of these characteristics of dreams has hitherto been looked for in dreams themselves, by regarding them as indications of a disordered, dissociated and so to say 'sleepy' activity of the nervous elements.

I have on the contrary shown that this strange 'manifest' content of the dream can regularly be made intelligible as a mutilated and altered transcript of certain rational psychical structures which deserve the name of '*latent dream-thoughts*'. We arrive at a knowledge of these by dividing the dream's manifest content into its component parts, without considering any apparent meaning it may have, and by then following the associative threads which start from each of what are now isolated elements. These interweave with one another and finally lead to a tissue of thoughts which are not only perfectly rational but can also be easily fitted into the known context of our mental processes. In the course of this 'analysis', the content of the dream will have cast off all the peculiarities that puzzled us. But if the analysis is to succeed, we must, while it proceeds, firmly reject the critical objections which will unceasingly arise to the reproduction of the various intermediary associations.

A comparison of the recollected manifest content of the dream with the latent dream-thoughts thus discovered gives rise to the concept of the 'dream-work'. The dream-work is the name for the whole sum of transforming processes which have converted the dream-thoughts into the manifest dream. The surprise with which we formerly regarded the dream now attaches to the dream-work.

The achievements of the dream-work can, however, be described as follows. A tissue of thoughts, usually a very complicated one, which has been built up during the day and has not been completely dealt with - 'a day's residue' - continues during the night to retain the quota of energy - the 'interest'- claimed by it, and threatens to disturb sleep. This 'day's residue' is transformed by the dream-work into a dream and made innocuous to sleep. In order to provide a fulcrum for the dream-work, the 'day's residue' must be capable of constructing a wish - which is not a very hard condition to fulfil. The wish arising from the dream-thoughts forms the preliminary stage and later the core of the dream. Experience derived from analyses - and not the theory of dreams - informs us that in children any wish left over from waking life is sufficient to call up a dream, which emerges as connected and ingenious but usually short, and which is easily recognized as a 'wish-fulfilment'. In the case of adults it seems to be a generally binding condition that the wish which creates the dream shall be one that is alien to conscious thinking - a repressed wish - or will possibly at least have reinforcements that are unknown to consciousness. Without assuming the existence of the unconscious in the sense explained above, I should not be able to develop the theory of dreams further or to interpret the material met with in dream-analyses. The action of this unconscious wish upon the consciously rational material of the dream-thoughts produces the dream. While this happens, the dream is, as it were, dragged down into the unconscious, or, more precisely, is submitted to a treatment such as is met with at the level of unconscious thought-processes and is characteristic of that level. Hitherto it is only from the results of the 'dream-work' that we are in fact acquainted with the characteristics of unconscious thinking and its differences from thinking that is capable of becoming conscious - 'preconscious' thinking.

A theory which is novel, which lacks simplicity and which runs counter to our habits of thought, can scarcely gain in clarity from a concise presentation. All I can aim at in these remarks, therefore, is to draw attention to the fuller treatment of the unconscious in my *Interpretation of Dreams* and to the writings of Lipps, which seem to me of the highest importance. I am aware that anyone who is under the spell of a good academic philosophical education, or who takes his opinions at long range from some so-called system of philosophy, will be opposed to the assumption of an 'unconscious psychical' in the sense in which Lipps and I use the term, and will prefer to prove its impossibility on the basis of a definition of the psychical. But definitions are a matter of convention and can be altered. I have often found that people who dispute the unconscious as being something absurd and impossible have not formed their impressions from the sources from which I at least was brought to the necessity of recognizing it. These opponents of the unconscious had never witnessed the effect of a post-hypnotic suggestion, and when I have told them examples from my analyses with non-hypnotized neurotics they have been filled with the greatest astonishment. They had never realized the idea that the unconscious is something which we really do not know, but which we are obliged by compelling inferences to supply; they had understood it as being something capable of becoming conscious but which was not being thought of at the moment, which did not occupy 'the focal point of attention'. Nor had they ever tried to convince themselves of the existence in their own minds of unconscious thoughts like these by analysing one of their own dreams; and when I attempted to do so with them they could only greet their own associations with surprise and confusion. I have also formed an impression that fundamental emotional resistances stand in the way of accepting the 'unconscious', and that these are based on the fact that no one wants to get to know his unconscious and that the most convenient plan is to deny its possibility altogether.

The dream-work, then - to which I return after this digression - submits the thought-material, which is brought forward in the optative mood, to a most strange revision. First, it takes the step from the optative to the present indicative; it replaces 'Oh! if only . . .' by 'It is'. The 'It is' is then given a hallucinatory representation; and this I have called the 'regression' in the dream-work - the path that leads from thoughts to perceptual images, or, to use the terminology of the still unknown topography of the mental apparatus (which is not to be taken anatomically), from the region of thought-structures to that of sensory perceptions. On this path, which is in the reverse direction to that taken by the course of development of mental complications, the dream-thoughts are given a pictorial character; and eventually a plastic situation is arrived at which is the core of the manifest 'dream-picture'. In order for it to be possible for the dream-thoughts to be represented in sensory form, their expression has to undergo far-reaching modifications. But while the thoughts are being changed back into sensory images still further alterations occur in them, some of which can be seen to be necessary while others are surprising. We can understand that, as a subsidiary result of regression, almost all the internal relations between the thoughts which linked them together will be lost in the manifest dream. The dream-work, as we might say, only undertakes to represent the raw material of the ideas and not the logical relations in which they stand to one another; or at all events it reserves the liberty to disregard the latter. On the other hand, there is another part of the dream-work which we cannot attribute to regression, to the change back into sensory images; and it is precisely this part which has an important bearing on our analogy with the formation of jokes. In the course of the dream-work the material of the dream-thoughts is subjected to a quite extraordinary compression or *condensation*. A starting point for it is provided by any common elements that may be present in the dream-thoughts, whether by chance or from the nature of their content. Since these are not as a rule sufficient for any considerable condensation, new artificial and transient common elements are created in the dream-work, and to this end there is actually a preference for the use of words the sound of which expresses different meanings. The newly-created common elements of condensation enter the manifest content of the dream as representatives of the dream-thoughts, so that an element in the dream corresponds to a nodal point or junction in the dream-thoughts, and, as compared with these latter, must quite generally be described as 'overdetermined'. The fact of condensation is the piece of the dream-work which can be most easily recognized; it is only necessary to compare the text of a dream as it is noted down with the record of the dream-thoughts arrived at by analysis in order to get a good impression of the extensiveness of dream-condensation.

It is less easy to convince oneself of the second great modification of the dream-thoughts that is brought about by the dream-work - the process that I have named 'dream-*displacement*'. This is exhibited in the fact that things that lie on the periphery of the dream-thoughts and are of minor importance occupy a central position and appear with great sensory intensity in the manifest dream, and *vice versa*. This gives the dream the appearance of being displaced in relation to the dream-thoughts, and this displacement is precisely what brings it about that the dream confronts waking mental life as something alien and incomprehensible. In order that a displacement of this kind may occur, it must be possible for the cathectic energy to pass over uninhibited from the important ideas to the unimportant ones - which, in normal thought that is capable of being conscious, can only give an impression of 'faulty reasoning'.

Transformation with a view to the possibility of representation, condensation and displacement are the three major achievements that may be ascribed to the dream-work. A fourth, which was perhaps too shortly considered in *The Interpretation of Dreams*, is not relevant for our present purposes. If the ideas of a 'topography of the mental apparatus' and of 'regression' are consistently followed up (and only in that way could these working hypotheses come to have any value), we must attempt to determine the stages of regression at which the various transformations of the dream-thoughts take place. This attempt has not yet been seriously undertaken; but it can at least be stated with certainty that displacement must take place in the thought-material while it is at the stage of the unconscious processes, while condensation must probably be pictured as a process stretching over the whole course of events till the perceptual region is reached. But in general we must be content to assume that all the forces which take part in the formation of dreams operate simultaneously. Though one must, as will be realized, exercise reserve in dealing with such problems, and though there are fundamental doubts, which cannot be entered into here, as to whether the question should be framed in this manner, yet I should like to venture on the assertion that the process of the dream-work preparatory to the dream must be located in the region of the unconscious. Thus, speaking roughly, there would in all be three stages to be distinguished in the formation of a dream: first, the transplanting of the preconscious day's residues into the unconscious, in which the conditions governing the state of sleep must play a part; then, the dream-work proper in the unconscious; and thirdly, the regression of the dream-material, thus revised, to perception, in which form the dream becomes conscious.

The following forces may be recognized as having a share in the formation of dreams: the wish to sleep, the cathexis of energy that still remains in the day's residues after it has been lowered by the state of sleep, the psychical energy of the dream-constructing unconscious wish and the opposing force of the 'censorship', which dominates daytime life and is not completely lifted during sleep. The task of dream-formation is above all to overcome the inhibition from the censorship; and it is precisely this task which is solved by the displacements of psychical energy within the material of the dream-thoughts.

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: *a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.*

Before we examine this hypothesis in detail, we will consider an objection which might threaten our premiss. We have started from the fact that the techniques of jokes indicate the same processes that are known to us as peculiarities of the dream-work. Now it is easy to argue against this that we should not have described the techniques of jokes as condensation, displacement, etc., and should not have arrived at such far reaching conformities between the methods of representation in jokes and dreams, if our previous knowledge of the dream-work had not prejudiced our view of the technique of jokes; so that at bottom we are only finding in jokes a confirmation of the expectations with which we approached them from dreams. If this was the basis of the conformity, there would be no certain guarantee of its existence apart from our prejudice. Nor indeed have condensation, displacement and indirect representation been taken by any other author as explaining the forms of expression of jokes. This would be a possible objection, but not on that account a just one. It would be equally possible that it was indispensable for our views to be sharpened by a knowledge of the dream-work before we could recognize the real conformity. A decision will after all depend only on whether a critical examination can prove on the basis of individual examples that this view of the technique of jokes is a forced one in whose favour other more plausible and deeper-going views have been suppressed, or whether such an examination is obliged to admit that the expectations derived from dreams can really be confirmed in jokes. I am of the opinion that we have nothing to fear from such criticism and that our procedure of 'reduction' (p. 1629) has shown us reliably in what forms of expression to look for the techniques of jokes. And if we gave those techniques names which already anticipated the discovery of the conformity between joke-technique and dream-work, we had a perfect right to do so and it was in fact nothing more than an easily justifiable simplification.

There is another objection which would not affect our case so seriously but which is also not so open to a fundamental disproof. It might be said that, while it is true that these techniques of joking which fit in so well with our scheme deserve to be recognized, they are nevertheless not the only possible techniques of joking nor the only ones used in practice. It might be argued that under the influence of the model of the dream-work we have only looked for techniques of joking which fitted in with it, while others, overlooked by us, would have proved that this conformity was not invariably present. I really cannot venture to assert that I have succeeded in elucidating the technique of every joke in circulation; and I must therefore leave open the possibility that my enumeration of joke-techniques will show some incompleteness. But I have not intentionally excluded from discussion any kind of technique that was clear to me, and I can declare that the commonest, most important and most characteristic methods of joking have not escaped my attention.

Jokes possess yet another characteristic which fits satisfactorily into the view of the joke-work which we have derived from dreams. We speak, it is true, of 'making' a joke; but we are aware that when we do so our behaviour is different from what it is when we make a judgement or make an objection. A joke has quite outstandingly the characteristic of being a notion that has occurred to us 'involuntarily'. What happens is not that we know a moment beforehand what joke we are going to make, and that all it then needs is to be clothed in words. We have an indefinable feeling, rather, which I can best compare with an '*absence*'¹, a sudden release of intellectual tension, and then all at once the joke is there - as a rule ready-clothed in words. Some of the techniques of jokes can be employed apart from them in the expression of a thought - for instance, the techniques of analogy or allusion. I can deliberately decide to make an allusion. In such a case I begin by having a direct expression of my thought in my mind (in my inner ear); I inhibit myself from expressing it owing to a misgiving related to the external situation, and can almost be said to make up my mind to replace the direct expression by another form of indirect expression; and I then produce an allusion. But the allusion which arises in this way and which is formed under my continuous supervision is never a joke, however serviceable it may be in other ways. A joking allusion, on the other hand, emerges without my being able to follow these preparatory stages in my thoughts. I will not attach too much importance to this behaviour; it is scarcely decisive, though it agrees well with our hypothesis that in the formation of a joke one drops a train of thought for a moment and that it then suddenly emerges from the unconscious as a joke.

¹ [The French term.]

Jokes show a special way of behaving, too, in regard to association. Often they are not at the disposal of our memory when we want them; but at other times, to make up for this, they appear involuntarily, as it were, and at points in our train of thought where we cannot see their relevance. These, again, are only small features, but nevertheless indicate their origin from the unconscious.

Let us now bring together those characteristics of jokes which can be referred to their formation in the unconscious. First and foremost there is the peculiar brevity of jokes - not, indeed, an essential, but an extremely distinctive feature. When we first came across it, we were inclined to regard it as an expression of the tendency to economy, but abandoned this view ourselves owing to obvious objections. It now seems to us rather a mark of the unconscious revision to which the joke-thought has been subjected. For we cannot connect what corresponds to it in dreams, condensation, with any factor other than localization in the unconscious; and we must suppose that the determinants for such condensations, which are absent in the preconscious, are present in the unconscious thought-process.¹ It is to be expected that in the process of condensation a few of the elements subjected to it will be lost, while others, which take over the cathectic energy of the former, will become intensified or over-intensified through the condensation. Thus the brevity of jokes, like that of dreams, would be a necessary concomitant of the condensations which occur in both of them - in both cases a result of the process of condensation. This origin would also account for the special character of the brevity of jokes, a character that cannot be further defined but which is felt as a striking one.

¹ Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) forgetting. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting.

In an earlier passage (p. 1715) we regarded one of the outcomes of condensation - multiple use of the same material, play upon words, and similarity of sound - as a localized economy, and the pleasure produced by an (innocent) joke as derived from that economy, and later we inferred that the original intention of jokes was to obtain a yield of pleasure of this kind from words - a thing which had been permitted at the stage of play but had been dammed up by rational criticism in the course of intellectual development. We have now adopted the hypothesis that condensations of this kind, such as serve the technique of jokes, arise automatically, without any particular intention, during thought-processes in the unconscious. Have we not before us here two different views of the same fact which seem incompatible with each other? I do not think so. It is true that they are two different views, and that they need to be brought into harmony with each other; but they are not contradictory. One of them is merely foreign to the other; and when we have established a connection between them, we shall probably have made some advance in knowledge. The fact that such condensations are sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for their production are easily found in the unconscious. We can, on the contrary, see a reason for the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of which jokes are in need arise there easily. There are, moreover, two other factors which at a first glance seem to be completely foreign to each other and to have come together as though by some undesired chance, but which on deeper investigation turn out to be intimately linked and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes during their development at the stage of play (that is, during the childhood of reason) are able to bring about these pleasurable condensations and that, on the other hand, at higher stages they accomplish the same effect by plunging the thought into the unconscious. For the infantile is the source of the unconscious, and the unconscious thought-processes are none other than those - the one and only ones - produced in early childhood. The thought which, with the intention of constructing a joke, plunges into the unconscious is merely seeking there for the ancient dwelling-place of its former play with words. Thought is put back for a moment to the stage of childhood so as once more to gain possession of the childish source of pleasure. If we did not already know it from research into the psychology of the neuroses, we should be led by jokes to a suspicion that the strange unconscious revision is nothing else than the infantile type of thought-activity. It is merely that it is not very easy for us to catch a glimpse in children of this infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, because it is for the most part corrected, as it were, *in statu nascendi*. But in a number of cases we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of unconscious material of this kind strikes us in general as 'comic'.¹

¹ Many of my neurotic patients who are under psycho-analytic treatment are regularly in the habit of confirming the fact by a laugh when I have succeeded in giving a faithful picture of their hidden unconscious to their conscious perception; and they laugh even when the content of what is unveiled would by no means justify this. This is subject, of course, to their having arrived close enough to the unconscious material to grasp it after the doctor has detected it and presented it to them.

It is easier to perceive the characteristics of these unconscious thought-processes in the remarks made by sufferers from certain mental diseases. We should most probably be able (as Griesinger suggested long ago) to understand the deliria of the insane and to make use of them as pieces of information, if we ceased to apply the demands of conscious thinking to them and if we treated them, like dreams, with our interpretative technique.¹ Indeed we have confirmed the fact that 'there is a return of the mind in dreams to an embryonic point of view'.²

We have entered so closely, in connection with the processes of condensation, into the importance of the analogy between jokes and dreams that we may be briefer in what follows. As we know, the displacements in the dream-work point to the operation of the censorship of conscious thinking, and accordingly, when we come across displacement among the techniques of jokes, we shall be inclined to suppose that an inhibitory force plays a part in the formation of jokes as well. And we already know that this is quite generally the case. The effort made by jokes to recover the old pleasure in nonsense or the old pleasure in words finds itself inhibited in normal moods by objections raised by critical reason; and in every individual case this has to be overcome. But the manner in which the joke-work accomplishes this task shows a sweeping distinction between jokes and dreams. In the dream-work it is habitually accomplished by displacements, by the selection of ideas which are sufficiently remote from the objectionable one for the censorship to allow them to pass, but which are nevertheless derivatives of that idea and have taken over its psychical cathexis by means of a complete transference. For this reason displacements are never absent in a dream and are far more comprehensive.

Among displacements are to be counted not merely diversions from a train of thought but every sort of indirect representation as well, and in particular the replacement of an important but objectionable element by one that is indifferent and that appears innocent to the censorship, something that seems like a very remote allusion to the other one - substitution by a piece of symbolism, or an analogy, or something small. It cannot be disputed that portions of such indirect representation are already present in the dream's preconscious thoughts - for instance, representation by symbols or analogies - because otherwise the thought would not have reached the stage of preconscious expression at all. Indirect representations of this kind, and allusions whose reference to the thing intended is easy to discover, are indeed permissible and much-used methods of expression in our conscious thinking as well. The dream-work, however, exaggerates this method of indirect expression beyond all bounds. Under the pressure of the censorship, any sort of connection is good enough to serve as a substitute by allusion, and displacement is allowed from any element to any other. Replacement of internal associations (similarity, causal connection, etc.) by what are known as external ones (simultaneity in time, contiguity in space, similarity of sound) is quite specially striking and characteristic of the dream-work.

¹ In doing so we should not forget to take into account the distortion due to the censorship which is still at work even in psychoses.

² *The Interpretation of Dreams* (1900a).

All these methods of displacement appear too as techniques of joking. But when they appear, they usually respect the limits imposed on their employment in conscious thinking; and they may be altogether absent, although jokes too have invariably a task to accomplish of dealing with an inhibition. We can understand the subordinate place taken by displacements in the joke-work when we recall that jokes always have another technique at their command for keeping off inhibition and indeed that we have found nothing more characteristic of them than precisely this technique. For jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered. They restrict themselves, however, to a choice of occasions in which this play or this nonsense can at the same time appear allowable (in jests) or sensible (in jokes), thanks to the ambiguity of words and the multiplicity of conceptual relations. Nothing distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on 'sense in nonsense'.

In view of the universal predominance in jokes of this peculiar technique for overcoming their inhibitions, it might be thought superfluous for them ever to make use in particular cases of the technique of displacement. But, on the one hand, certain species of that technique remain of value to jokes as aims and as sources of pleasure - for instance, displacement proper (diversion of thoughts), which indeed partakes of the nature of nonsense. On the other hand, it should not be forgotten that the highest stage of jokes, tendentious jokes, often have to overcome two kinds of inhibition, those opposed to the joke itself and those opposed to its purpose (p. 1696), and that allusions and displacements are well qualified to make this latter task possible.

The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream-analysis, in which are set out, therefore, the strange processes of allusions and displacements - processes so obnoxious to waking life - of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as *successful* jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes. We shall presently learn that, as a result of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.

Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 1670 f.). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of *irony*, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

In the dream-work, representation by the opposite plays a far greater part even than in jokes. Dreams are not merely fond of representing two contraries by one and the same composite structure, but they so often change something in the dream-thoughts into its opposite that this leads to a great difficulty in the work of interpretation. 'There is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'²

¹ The characteristic of the comic which is described as its 'dryness' depends likewise on the distinction between a statement and the gestures (in the widest sense of the word) accompanying it.

² *The Interpretation of Dreams.*

I must state emphatically that this fact has not up to now met with any recognition. But it seems to point to an important characteristic of unconscious thinking, in which in all probability no process that resembles 'judging' occurs. In the place of rejection by a judgement, what we find in the unconscious is 'repression'. Repression may, without doubt, be correctly described as the intermediate stage between a defensive reflex and a condemning judgement.¹

Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream-thoughts. Thus the absurdity in the content of the dream takes the place of the judgement 'this is a piece of nonsense' in the dream-thoughts. I laid great stress on the evidence of this in my *Interpretation of Dreams* because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all - an error which blocks the way to a knowledge of the unconscious. We have now learned, in the course of solving certain tendentious jokes (p. 1660 ff.), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psychical expenditure and so to raise the quota liberated for discharge by laughing. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.²

¹ The highly remarkable and still insufficiently appreciated behaviour of the relation between contraries in the unconscious is no doubt likely to help our understanding of 'negativism' in neurotic and insane patients. (Cf. the two last works on the subject: Bleuler, 1904 and Gross, 1904. [Added 1912:] See also my review of 'The Antithetical Meaning of Primal Words' (1910e).)

² An expression used by Fechner which has acquired importance as a support for my views.

The assignment of the joke-work to the system of the unconscious has, I think, become of considerably greater importance to us now that it has enabled us to understand the fact that the techniques to which jokes admittedly cling are, on the other hand, not their exclusive property. Some doubts which we were obliged to hold over until later in our original examination of these techniques now find a comfortable solution. For that very reason another doubt that arises is all the more deserving of our consideration. This suggests that the undeniable relation of jokes to the unconscious is in fact only valid for certain categories of tendentious jokes, whereas we are prepared to extend it to every species and every developmental stage of jokes. We must not evade an examination of this objection.

It can be assumed with certainty that jokes are formed in the unconscious when it is a question of jokes in the service of unconscious purposes or of purposes reinforced by the unconscious - that is, of most 'cynical' jokes. For in such cases the unconscious purpose drags the preconscious thought down into the unconscious and there gives it a new shape - a process to which the study of the psychology of the neuroses has taught us numerous analogies. In the case, however, of tendentious jokes of other kinds, of innocent jokes and of jests, this downward dragging force seems absent and the relation of jokes to the unconscious is accordingly called in question.

But let us now consider the case in which a thought, not worthless in itself, arises in the course of a train of thought and is expressed as a joke. In order to enable this thought to be turned into a joke, it is clearly necessary to select from among the possible forms of expression the precise one which brings along with it a yield of verbal pleasure. We know from self-observation that this selection is not made by conscious attention; but it will certainly help the selection if the cathexis of the preconscious thought is reduced to an unconscious one, for, as we have learnt from the dream-work, the connecting paths which start out from *words* are in the unconscious treated in the same way as connections between *things*. An unconscious cathexis offers far more favourable conditions for selecting the expression. Moreover, we can immediately assume that the possible form of expression that involves a yield of verbal pleasure exercises the same downward drag on the still unsettled wording of the preconscious thought as did the unconscious purpose in the earlier case. To meet the simpler case of the jest, we may suppose that an intention which is all the time on the look-out to achieve a yield of verbal pleasure grasps the occasion offered in the preconscious for dragging the cathectic process down into the unconscious according to the familiar pattern.

I should be very glad if it were possible for me on the one hand to give a clearer exposition of this single decisive point in my view of jokes and on the other hand to reinforce it with conclusive arguments. But in fact what I am faced with here is not a two-fold failure but one and the same failure. I cannot give a clearer exposition because I have no further proof of my view. I arrived at it on the basis of a study of the technique and of a comparison with the dream-work, and on no other basis; and I then found that on the whole it fits in excellently with the characteristics of jokes. Thus this view has been arrived at by inference; and if from an inference of this kind one is led, not to a familiar region, but on the contrary, to one that is alien and new to one's thought, one calls the inference a 'hypothesis' and rightly refuses to regard the relation of the hypothesis to the material from which it was inferred as a 'proof' of it. It can only be regarded as 'proved' if it is reached by another path as well and if it can be shown to be the nodal point of still other connections. But proof of this sort is not to be had, in view of the fact that our knowledge of unconscious processes has scarcely begun. In the realization that we are standing upon ground which has never before been trodden, we are thus content, from our point of observation, to take one single, short and uncertain step forward into the unexplored region.

On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The *jest* springs from a cheerful mood, which seems to be characterized by an inclination to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfils their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of *innocent jokes* that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special *personal aptitude*, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making *jokes* is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

With this last contribution, however, which explains, even though still only hypothetically, the joke-work in the first person, our interest in jokes is, strictly speaking, at an end. It remains for us to make a further short comparison between jokes and the better-known dream; and we may expect that, apart from the single conformity we have already considered, two such dissimilar mental functions will only reveal differences. The most important difference lies in their social behaviour. A dream is a completely asocial mental product; it has nothing to communicate to anyone else; it arises within the subject as a compromise between the mental forces struggling in him, it remains unintelligible to the subject himself and is for that reason totally uninteresting to other people. Not only does it not need to set any store by intelligibility, it must actually avoid being understood, for otherwise it would be destroyed; it can only exist in masquerade. For that reason it can without hindrance make use of the mechanism that dominates unconscious mental processes, to the point of a distortion which can no longer be set straight. A joke, on the other hand, is the most social of all the mental functions that aim at a yield of pleasure. It often calls for three persons and its completion requires the participation of someone else in the mental process it starts. The condition of intelligibility is, therefore, binding on it; it may only make use of possible distortion in the unconscious through condensation and displacement up to the point at which it can be set straight by the third person's understanding. Moreover, jokes and dreams have grown up in quite different regions of mental life and must be allotted to points in the psychological system far remote from each other. A dream still remains a wish, even though one that has been made unrecognizable; a joke is developed play. Dreams, in spite of all their practical nonentity, retain their connection with the major interests of life; they seek to fulfil needs by the regressive detour of hallucination, and they are permitted to occur for the sake of the one need that is active during the night - the need to sleep. Jokes, on the other hand, seek to gain a small yield of pleasure from the mere activity, untrammelled by needs, of our mental apparatus. Later they try to catch hold of that pleasure as a by-product during the activity of that apparatus and thus arrive *secondarily* at not unimportant functions directed to the external world. Dreams serve predominantly for the avoidance of unpleasure, jokes for the attainment of pleasure; but all our mental activities converge in these two aims.

VII

JOKES AND THE SPECIES OF THE COMIC

We have approached the problems of the comic in an unusual way. It seemed to us that jokes, which are ordinarily regarded as a sub-species of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out *en passant* a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found - and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes re-open sources of the comic which have become inaccessible, and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 1739). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no one else had hitherto made use - a knowledge of the dream-work. We have no similar advantage at our command to help us to understand the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, in so far as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

The type of the comic which stands nearest to jokes is the naïve. Like the comic in general, the naïve is 'found' and not, like a joke, 'made'. Indeed, the naïve cannot be made at all, whereas alongside the pure comic we have to take into account the case in which something is made comic - an evocation of the comic. The naïve must arise, without our taking any part in it, in the remarks and actions of other people, who stand in the position of the *second* person in the comic or in jokes. The naïve occurs if someone completely disregards an inhibition because it is not present in him - if, therefore, he appears to overcome it without any effort. It is a condition for the naïve's producing its effect that we should know that the person concerned does not possess the inhibition; otherwise we call him not naïve but impudent. We do not laugh at him but are indignant at him. The effect produced by the naïve is irresistible, and seems simple to understand. An inhibitory expenditure which we usually make suddenly becomes unutilizable owing to our hearing the naïve remark, and it is discharged by laughter. There is no need here for the attention to be distracted, probably because the lifting of the inhibition occurs directly and not through the intermediary of an operation that has been provoked. In this we are behaving like the third person in a joke, who is presented with the economy in inhibition without any effort on his own part.

In view of the insight we have gained into the genesis of inhibitions from following the course of development from play to jokes, it will not surprise us to find that the naïve occurs far the most often in children, and is then carried over to uneducated adults, whom we may regard as childish so far as their intellectual development is concerned. Naïve *remarks* are, of course, better suited for comparison with jokes than naïve actions, since remarks and not actions are the usual form in which jokes are expressed. It is illuminating to find that naïve remarks like those made by children may also be described as 'naïve jokes'. The conformity between jokes and *naïveté*, as well as the reasons for their dissimilarity, will be made clearer to us by a few examples.

A three-and-a-half-year-old girl gave this warning to her brother: 'I say, don't eat so much of that pudding or you'll get ill and have to have some "*Bubizin*".' "*Bubizin*"? asked her mother, 'What's that?' 'When I was ill', answered the child in self-justification, 'I had to have some *Medizin*.' The child thought that what the doctor prescribed was called '*Mädi-zin*' when it was for a '*Mädi*' [little girl] and concluded that if it was for a '*Bubi*' [little boy] it would be called '*Bubi-zin*'. This is constructed like a verbal joke working with the technique of similarity of sound, and indeed it might have occurred as a real joke, in which case we should have greeted it, half-unwillingly, with a smile. As an example of *naïveté* it strikes us as quite excellent and it raises a laugh. What is it that makes the difference here between a joke and something naïve? Evidently not the wording or the technique, which would be the same for both possibilities, but a factor, rather, which at first sight seems quite remote from both of them. It is merely a question of whether we assume that the speaker has intended to make a joke or whether we suppose that he - the child - has tried in good faith to draw a serious conclusion on the basis of his uncorrected ignorance. Only the latter case is one of *naïveté*. Here for the first time our attention is drawn to the other person putting himself into the psychical process that occurs in the person who produces the remark.

This view will be confirmed if we examine another example. A brother and sister - a twelve-year-old girl and a ten-year-old boy - were performing a drama composed by themselves before an audience of uncles and aunts. The scene represented a hut by the sea-shore. In the first act the two author-actors, a poor fisherman and his honest wife, are complaining about the hard times and their small earnings. The husband decides to cross the wide seas in his boat to seek his fortune elsewhere, and, after tender farewells between the two of them, the curtain falls. The second act takes place a few years later. The fisherman has returned a wealthy man with a big bag of money; and he tells his wife, who awaits his arrival outside the hut, what good fortune he has met with in foreign lands. His wife interrupts him proudly: 'I too have not been idle.' And thereupon she opens the door of the hut and reveals to his eyes twelve large dolls lying asleep on the floor. . . . At this point in the drama the actors were interrupted by a storm of laughter from the audience, which they were unable to understand. They stared disconcerted at their fond relatives, who had behaved properly till then and had listened with eager attention. The laughter is explained on the supposition that the audience assumed that the young authors still knew nothing of the conditions governing the origin of children and were therefore able to believe that a wife could boast of the offspring born during her husband's long absence and that a husband could rejoice with her over them. What the authors produced on the basis of this ignorance might be described as nonsense or absurdity.

A third example will show us yet another technique, the acquaintance of which we have made in jokes, in the service of the naïve. A 'Frenchwoman'¹ was engaged as governess for a little girl, but did not meet with her personal approval. Scarcely had the newcomer left the room when the little girl gave voice to loud criticism: '*That* a Frenchwoman? She may *call* herself one because she once lay beside a Frenchman!' This might have been a joke - even a tolerably good one (double meaning or allusion, with *double entendre*) if the child had had the slightest notion of the possibility of the double meaning. In fact she had merely transferred to the stranger she disliked a facetious way of describing a thing as ungenuine which she had often heard: '*That* genuine gold? It may once have lain beside gold.' Owing to the child's ignorance, which so completely altered the psychical process in her understanding hearers, her remark became a naïve one. In consequence of this condition, there is the possibility of a *misleading naïveté*. We may assume in the child an ignorance that no longer exists; and children often represent themselves as naïve, so as to enjoy a liberty that they would not otherwise be granted.

¹ ['*Französin*.' The ordinary term for a French governess in Austria.]

We can illustrate from these examples the position occupied by the naïve between jokes and the comic. The naïve (in speech) agrees with jokes as regards wording and content: it brings about a misuse of words, a piece of nonsense, or a piece of smut. But the psychical process in the first person, who produces it, which raised so many interesting and puzzling questions for us in regard to jokes, is here completely absent. A naïve person thinks he has used his means of expression and trains of thought normally and simply, and he has no *arrière pensée* in mind; nor does he derive any yield of pleasure from producing something naïve. None of the characteristics of the naïve exist except in the apprehension of the person who hears it - a person who coincides with the third person in jokes. Moreover the person who produces it does so without any effort. The complicated technique, which in jokes is designed to paralyse the inhibition arising from rational criticism, is absent in him; he does not possess this inhibition as yet, so that he can produce nonsense and smut directly and without compromise. In that respect the naïve is a marginal case of the joke; it arises if in the formula for the construction of jokes we reduce the value of the censorship to zero.

Whereas it was a condition for the effectiveness of a joke that both persons should be subject to approximately the same inhibitions or internal resistances, it will be seen that it is a condition for the naïve that the one person should possess inhibitions which the other is without. The apprehension of the naïve lies with the person provided with inhibitions, and he alone obtains the yield of pleasure which the naïve brings about. We have come near to guessing that that pleasure arises from the lifting of inhibitions. Since the pleasure from jokes has the same origin - a core of verbal pleasure and pleasure from nonsense, and a casing of pleasure in the lifting of inhibitions or in the relief of psychical expenditure - this similar relation to inhibition explains the internal kinship between the naïve and jokes. In both of them the pleasure arises through the lifting of internal inhibition.

The psychical process in the receptive person, however, is as much more complicated in the case of the naïve as it is simplified in comparison with jokes in the productive person. (In the case of the naïve, incidentally, our own self invariably coincides with the receptive person, while in the case of jokes we may equally occupy the position of the productive one.) When the receptive person hears something naïve, it must on the one hand affect him like a joke - and our examples give evidence precisely of this - for, as with a joke, the lifting of the censorship is made possible for him by no more than the effort of listening. But only a part of the pleasure created by the naïve can be explained in this way; and even this might be endangered in certain instances - for example, at hearing a naïve piece of smut. We might react to this at once with the same indignation that might be felt against a real piece of smut, if it were not that another factor spares us this indignation and at the same time offers us the more important part of our pleasure in the naïve. This other factor is the condition already mentioned that, in order to recognize the naïve, we must know that the internal inhibition is absent in the producing person. Only when this is certain do we laugh instead of being indignant. Thus we take the producing person's psychical state into consideration, put ourselves into it and try to understand it by comparing it with our own. It is these processes of empathy and comparison that result in the economy in expenditure which we discharge by laughing.

It would be possible to prefer a simpler account - that our indignation is made superfluous by the fact that the other person has had no need to overcome a resistance; in that case the laughter would occur at the cost of the economy in indignation. In order to discourage this view, which is on the whole misleading, I will make a sharper distinction between two cases which I have treated together above. The naïve which we come across can either be in the nature of a joke, as it was in our examples, or in the nature of smut (or of what is in general objectionable); and the latter will occur especially when it is expressed not in speech but in action. This second alternative is really misleading: one could suppose, as far as it is concerned, that the pleasure arises from the economized and transformed indignation. But the first alternative throws more light on things. A naïve remark - e.g. '*Bubizin*' - can in itself act like a minor joke and give no cause for indignation. This alternative is certainly the less frequent; but it is the purer and by far the more instructive. In so far as what we are concerned with is the fact that the child has seriously and without *arrière pensée* believed that the syllable '*Medi*' in '*Medizin*' is identical with her own name '*Mädi*', our pleasure in what we hear receives an increase which has no longer anything to do with pleasure in a joke. We now look at what has been said from two points of view - once in the way it happened in the child and once in the way it would have happened to us; and in making this comparison we see that the child has found an identity and that she has overcome a barrier that exists for us; and we then seem to go further and say to ourselves: 'If you choose to understand what you've heard, you can economize the expenditure on keeping up this barrier.' The expenditure liberated in a comparison like this is the source of pleasure in the naïve and it is discharged by laughter; and it is, incidentally, the same pleasure that we should otherwise have transformed into indignation, if this had not been excluded by our understanding of the producing person and, in this case, by the nature of what was said as well. But if we take the instance of a naïve joke as a model for the other alternative, of something naïve that is objectionable, we shall see that there too the economy in inhibition can arise directly from the comparison, that there is no necessity for us to assume an indignation that begins and is then stifled, and that this indignation in fact only corresponds to using the liberated expenditure in another way - against which in the case of jokes complicated protective arrangements were necessary.

This comparison, and this economy in expenditure by putting oneself into the mental process of the producing person, can only claim to be of significance for the naïve, however, if it is not in it alone that they are found. A suspicion occurs to us, in fact, that this mechanism, which is wholly alien to jokes, may be a part and perhaps an essential part of the psychical process in the comic. Looked at from this point of view - and this is undoubtedly the most important aspect of the naïve - the naïve thus presents itself as a species of the comic. The extra element in our examples of naïve speeches that is added to the pleasure of a joke is 'comic' pleasure. We should be inclined to assume of it quite generally that it arises from expenditure economized in a comparison of someone else's remarks with our own. But since this leads us to far-reaching considerations, we will first conclude our discussion of the naïve. The naïve, then, would be a species of the comic in so far as its pleasure springs from the difference in expenditure which arises in trying to understand someone else; and it would approach the joke in being subject to the condition that the expenditure economized in the comparison must be an inhibitory expenditure.¹

Let us hastily add a few points of agreement and of difference between the concepts that we have just reached and those which have long been familiar in the psychology of the comic. The putting of oneself in the other person's place and trying to understand him is clearly nothing other than the 'comic lending' which since Jean Paul has played a part in the analysis of the comic; the 'comparing' of someone else's mental process with one's own corresponds to the 'psychological contrast' which we can at last find a place for here, after not knowing what to do with it in jokes. But we differ in our explanation of comic pleasure from many authorities who regard it as arising from the oscillation of attention backwards and forwards between contrasting ideas. A mechanism of pleasure like this would seem incomprehensible to us;² but we may point out that in a comparison between contrasts a difference in expenditure occurs which, if it is not used for some other purpose, becomes capable of discharge and may thus become a source of pleasure.

¹ In what I have written, I have all the time identified the naïve with the naïve-comic, which is certainly not in every case admissible. But it is enough for our purposes to study the character of the naïve in 'naïve jokes' and in 'naïve smut'. Any further investigation would imply an intention on my part of using this as a basis for my explanation of the comic.

² Bergson, too, rejects the idea of comic pleasure having any such derivation, which is evidently influenced by an effort to establish an analogy with the laughter caused by tickling; and he supports his view with some good arguments (1900, 99). - The explanation of comic pleasure given by Lipps is on a quite different plane: in accordance with his view of the comic, he would regard it as something that is 'unexpectedly small'.

It is only with misgivings that I venture to approach the problem of the comic itself. It would be presumptuous to expect that my efforts would be able to make any decisive contribution to its solution when the works of a great number of eminent thinkers have failed to produce a wholly satisfactory explanation. My intention is in fact no more than to pursue the lines of thought that have proved valuable with jokes a short distance further into the sphere of the comic.

The comic arises in the first instance as an unintended discovery derived from human social relations. It is found in people - in their movements, forms, actions and traits of character, originally in all probability only in their physical characteristics but later in their mental ones as well or, as the case may be, in the expression of those characteristics. By means of a very common sort of personification, animals become comic too, and inanimate objects. At the same time, the comic is capable of being detached from people, in so far as we recognize the conditions under which a person seems comic. In this way the comic of situation comes about, and this recognition affords the possibility of making a person comic at one's will by putting him in situations in which his actions are subject to these comic conditions. The discovery that one has it in one's power to make someone else comic opens the way to an undreamt-of yield of comic pleasure and is the origin of a highly developed technique. One can make *oneself* comic, too, as easily as other people. The methods that serve to make people comic are: putting them in a comic situation, mimicry, disguise, unmasking, caricature, parody, travesty, and so on. It is obvious that these techniques can be used to serve hostile and aggressive purposes. One can make a person comic in order to make him become contemptible, to deprive him of his claim to dignity and authority. But even if such an intention habitually underlies making people comic, this need not be the meaning of what is comic spontaneously.

This irregular survey of the occurrences of the comic will already show us that a very extensive field of origin is to be ascribed to it and that such specialized conditions as we found, for instance, in the naïve are not to be expected in it. In order to get on the track of the determining condition that is valid for the comic, the most important thing is the choice of an introductory case. We shall choose the comic of movement, because we recollect that the most primitive kind of stage performance - the pantomime - uses that method for making us laugh. The answer to the question of why we laugh at the clown's movements is that they seem to us extravagant and inexpedient. We are laughing at an expenditure that is too large. Let us look now for the determining condition outside the comic that is artificially constructed - where it can be found unintended. A child's movements do not seem to us comic, although he kicks and jumps about. On the other hand, it *is* comic where a child who is learning to write follows the movements of his pen with his tongue stuck out; in these associated motions we see an unnecessary expenditure of movement which we should spare ourselves if we were carrying out the same activity. Similarly, other such associated motions, or merely exaggerated expressive movements, seem to us comic in adults too. Pure examples of this species of the comic are to be seen, for instance, in the movements of someone playing skittles who, after he has released the ball, follows its course as though he could still continue to direct it. Thus, too, all grimaces are comic which exaggerate the normal expression of the emotions, even if they are produced involuntarily as in sufferers from St. Vitus's dance (chorea). And in the same way, the passionate movements of a modern conductor seem comic to any unmusical person who cannot understand their necessity. Indeed, it is from this comic of movement that the comic of bodily shapes and facial features branches off; for these are regarded as though they were the outcome of an exaggerated or pointless movement. Staring eyes, a hooked nose hanging down to the mouth, ears sticking out, a hump-back - all such things probably only produce a comic effect in so far as movements are imagined which would be necessary to bring about these features; and here the nose, the ears and other parts of the body are imagined as more movable than they are in reality. There is no doubt that it is comic if someone can 'waggle his ears', and it would certainly be still more comic if he could move his nose up and down. A good deal of the comic effect produced on us by animals comes from our perceiving in them movements such as these which we cannot imitate ourselves.

But how is it that we laugh when we have recognized that some other person's movements are exaggerated and inexpedient? By making a comparison, I believe, between the movement I observe in the other person and the one that I should have carried out myself in his place. The two things compared must of course be judged by the same standard, and this standard is my expenditure of innervation, which is linked to my idea of the movement in both of the two cases. This statement calls for elucidation and expansion.

What we are here comparing is on the one hand the psychical expenditure while we are having a certain idea and on the other hand the content of the thing that we are having the idea of. Our statement says that the former is not in general and in theory independent of the latter, the content of the idea, and in particular that the idea of something large demands more expenditure than the idea of something small. So long as it is only a matter of the idea of different large *movements*, there should be no difficulties over the theoretical grounds for our statement or over proving it by observation. We shall see that in this case an attribute of the idea in fact coincides with an attribute of what we have an idea of, though psychology warns us as a rule against such a confusion.

I have acquired the idea of a movement of a particular size by carrying the movement out myself or by imitating it, and through this action I have learnt a standard for this movement in my innervatory sensations.¹

When, now, I perceive a movement like this of greater or lesser size in someone else, the surest way to an understanding (an apperception) of it will be for me to carry it out by imitation, and I can then decide from the comparison on which of the movements my expenditure was the greater. An impulsion of this kind to imitation is undoubtedly present in perceptions of movements. But actually I do not carry the imitation through, any more than I still spell words out if I learnt to read by spelling. Instead of imitating the movement with my muscles, I have an idea of it though the medium of my memory-traces of expenditures on similar movements. Ideation or 'thinking' differs from acting or performing above all in the fact that it displaces far smaller cathectic energies and holds back the main expenditure from discharge.

¹ The memory of this innervatory expenditure will remain the essential part of my idea of this movement, and there will always be modes of thinking in my mental life in which the idea will be represented by nothing else than this expenditure. In other circumstances, indeed, this element may be replaced by another - for instance, by visual images of the aim of the movement or by a verbal image; and in certain kinds of abstract thinking a token will suffice instead of the full content of the idea.

But how is the *quantitative* factor - the greater or lesser size - of the perceived movement to be given expression in the idea? And if there can be no representation of quantity in the idea, which is made up of qualities, how can I distinguish the ideas of movements of different sizes? - how can I make the comparison on which everything here depends? The way is pointed out by physiology, for it teaches us that even during the process of ideation innervations run out to the muscles, though these, it is true, correspond to a very modest expenditure of energy. Now it becomes very plausible to suppose that this innervatory energy that accompanies the process of ideation is used to represent the quantitative factor of the idea: that it is larger when there is an idea of a large movement than when it is a question of a small one. Thus the idea of the larger movement would in this case in fact be the larger one - that is, it would be the idea accompanied by the larger expenditure of energy.

Direct observation shows that human beings are in the habit of expressing the attributes of largeness and smallness in the contents of their ideas by means of a varying expenditure in a kind of *ideational mimetics*. If a child or a man from the common people, or a member of certain races, narrates or describes something, it is easy to see that he is not content to make his idea plain to the hearer by the choice of clear words, but that he also represents its subject-matter in his expressive movements: he combines the mimetic and the verbal forms of representation. And he especially demonstrates quantities and intensities: 'a high mountain' - and he raises his hand over his head, 'a little dwarf' - and he holds it near the ground. He may have broken himself of the habit of painting with his hands, yet for that reason he will do it with his voice; and if he exercises self-control in this too, it may be wagered that he will open his eyes wide when he describes something large and squeeze them shut when he comes to something small. What he is thus expressing is not his affects but actually the content of what he is having an idea of.

Are we to suppose, then, that this need for mimetics is only aroused by the requirements of communicating something, in spite of the fact that a good part of this method of representation altogether escapes the hearer's attention? On the contrary, I believe that these mimetics exist, even if with less liveliness, quite apart from any communication, that they occur as well when the subject is forming an idea of something for his own private benefit and is thinking of something pictorially, and that he then expresses 'large' and 'small' in his own body just as he does in speech, at all events by a change in the innervation of his features and sense organs. I can even believe that the somatic innervation which is commensurate with the content of what he is having an idea of may have been the beginning and origin of mimetics for purposes of communication; it only needed to be intensified and made noticeable to other people in order to be able to serve that end. If I support the view that to the 'expression of the emotions', which is well known as the physical concomitant of mental processes, there should be added the 'expression of the ideational content', I can see quite clearly that my remarks relating to the category of large and small do not exhaust the subject. I might myself add a variety of points even before arriving at the phenomena of tension by which a person indicates somatically the concentration of his attention and the level of abstraction at which his thinking is at the moment proceeding. I regard the matter as a really important one, and I believe that if ideational mimetics are followed up, they may be as useful in other branches of aesthetics as they are here for an understanding of the comic.

To return now to the comic of movement. When, I repeat, a particular movement is perceived, the impulsion is given to forming an idea of it by means of a certain expenditure of energy. In 'trying to understand', therefore, in apperceiving this movement, I make a certain expenditure, and in this portion of the mental process I behave exactly as though I were putting myself in the place of the person I am observing. But at the same moment, probably, I bear in mind the aim of this movement, and my earlier experience enables me to estimate the scale of expenditure required for reaching that aim. In doing so I disregard the person whom I am observing and behave as though I myself wanted to reach the aim of the movement. These two possibilities in my imagination amount to a comparison between the observed movement and my own. If the other person's movement is exaggerated and inexpedient, my increased expenditure in order to understand it is inhibited *in statu nascendi*, as it were in the act of being mobilized; it is declared superfluous and is free for use elsewhere or perhaps for discharge by laughter. This would be the way in which, other circumstances being favourable, pleasure in a comic movement is generated - an innervatory expenditure which has become an unusable surplus when a comparison is made with a movement of one's own.

It will be seen that our discussions must proceed in two different directions: first, to establish the conditions governing the discharge of the surplus, and second, to examine whether the other cases of the comic can be looked at in the same way as the comic of movement.

We will take the second question first and will turn from the comic of movement and action to the comic which is found in the intellectual functions and the character traits of other people.

As a sample of this class we may choose comic nonsense, as it is produced by ignorant candidates in an examination; it is no doubt more difficult to give a simple example of character traits. We should not be confused if we find that nonsense and stupidity, which so often produce a comic effect, are nevertheless not felt as comic in every case, just as the same characters which on one occasion can be laughed at as comic may on another occasion strike one as contemptible or hateful. This fact, of which we must not lose sight, merely points out that other factors are concerned in producing the comic effect besides the comparison we know about - factors which we may be able to trace out in another connection.

The comic that is found in someone else's intellectual and mental characteristics is evidently once again the outcome of a comparison between him and my own self, though, curiously enough, a comparison which has as a rule produced the opposite result to that in the case of a comic movement or action. In this latter case it was comic if the other person had made a greater expenditure than I thought I should need. In the case of a mental function, on the contrary, it becomes comic if the other person has spared himself expenditure which I regard as indispensable (for nonsense and stupidity are inefficiencies of function). In the former case I laugh because he has taken too much trouble, in the latter because he has taken too little. The comic effect apparently depends, therefore, on the *difference* between the two cathectic expenditures - one's own and the other person's as estimated by 'empathy' - and not on which of the two the difference favours. But this peculiarity, which at first sight confuses our judgement, vanishes when we bear in mind that a restriction of our muscular work and an increase of our intellectual work fit in with the course of our personal development towards a higher level of civilization. By raising our intellectual expenditure we can achieve the same result with a diminished expenditure on our movements. Evidence of this cultural success is provided by our machines.¹

Thus a uniform explanation is provided of the fact that a person appears comic to us if, in comparison with ourselves, he makes too great an expenditure on his bodily functions and too little on his mental ones; and it cannot be denied that in both these cases our laughter expresses a pleasurable sense of the superiority which we feel in relation to him. If the relation in the two cases is reversed - if the other person's physical expenditure is found to be less than ours or his mental expenditure greater - then we no longer laugh, we are filled with astonishment and admiration.²

¹ As the proverb says: 'Was man nicht im Kopfe hat, muss man in den Beinen haben.' [Literally: 'What one hasn't in one's head one must have in one's legs,']

² The contradictoriness with which the determining conditions of the comic are pervaded - the fact that sometimes an excess and sometimes an insufficiency seems to be the source of comic pleasure - has contributed no little to the confusion of the problem. Cf. Lipps (1898, 47).

The origin of comic pleasure which has been discussed here - its derivation from a comparison of another person with our self, from the difference between our own psychical expenditure and the other person's as estimated by empathy - is probably the most important genetically. It is certain, however, that it has not remained the only one. We have learnt at one time or other to disregard this comparison between the other person and ourself and to derive the pleasurable difference from the one side only, whether from the empathy or from the processes in ourself - which proves that the feeling of superiority bears no essential relation to comic pleasure. A comparison is indispensable for the generation of this pleasure. We find that it is made between two cathectic expenditures that occur in rapid succession and are concerned with the same function, and these expenditures are either brought about in us through empathy into someone else or, without any such relation, are discovered in our own mental processes.

The first of these cases - in which, therefore, the other person still plays a part, though no longer in comparison with our own self - arises when the pleasurable difference in cathectic expenditures is brought about by external influences, which we may sum up as a 'situation'. For that reason, this species of the comic is also known as 'the comic of situation'. The characteristics of the person who provides the comic effect do not in this case play an essential part: we laugh even if we have to confess that we should have had to do the same in that situation. We are here extracting the comic from the relation of human beings to the often over-powerful external world; and so far as the mental processes of a human being are concerned, this external world also comprises social conventions and necessities and even his own bodily needs. A typical instance of the latter kind is provided if, in the middle of an activity which makes demands on a person's mental powers, he is suddenly interrupted by a pain or an excretory need. The contrast which, through empathy, offers us the comic difference is that between the high degree of interest taken by him *before* the interruption and the minimal one that he has left over for his mental activity when the interruption has occurred. The person who offers us this difference becomes comic to us once again for his inferiority; but he is inferior only in comparison with his earlier self and not in comparison with *us*, for we know that in the same circumstances we could not have behaved otherwise. But it is noteworthy that we only find someone's being put in a position of inferiority comic where there is empathy - that is, where someone else is concerned: if we ourselves were in similar straits we should be conscious only of distressing feelings. It is probably only by keeping such feelings away from ourselves that we are able to enjoy pleasure from the difference arising out of a comparison between these changing cathexes.

The other source of the comic, which we find in the transformations of *our own* cathexes, lies in our relations with the future, which we are accustomed to anticipate with our expectant ideas. I assume that a quantitatively definite expenditure underlies each of our ideas - an expenditure which, in the event of a disappointment, is therefore diminished by a definite difference. Here I may once again recall the remarks I made earlier on 'ideational mimetics'. But it seems to me to be easier to prove a real mobilization of cathectic energy in the case of expectation. It is quite obviously true of a number of cases that motor preparations are what form the expression of expectation - above all in all cases in which the expected event makes demands on my motility - and that these preparations can be at once determined quantitatively. If I am expecting to catch a ball which is being thrown to me, I put my body into tensions which will enable it to meet the impact of the ball; and, should the ball when it is caught turn out to be too light, my superfluous movements make me comic to the spectators. I have let myself be enticed by my expectation into an exaggerated expenditure of movement. The same is true if, for instance, I lift a fruit which I have judged to be heavy out of a basket, but which, to my disappointment, turns out to be a sham one, hollow and made of wax. My hand, by jumping up, betrays the fact that I had prepared an innervation too large for the purpose - and I am laughed at for it. There is at least one case in which the expenditure on expectation can be directly demonstrated measurably by physiological experiments on animals. In Pavlov's experiments on salivary secretions, various kinds of food are set before dogs in whom a salivary fistula has been opened; the amounts of saliva secreted then vary according to whether the experimental conditions confirm or disappoint the dogs' expectations of being fed with the food set before them.

Even when what is expected makes demands on my sense organs and not on my motility, I may assume that the expectation is expressed in a certain motor expenditure towards making the senses tense and towards holding back other impressions that are not expected; and, in general, I may regard an attitude of attention as being a motor function equivalent to a certain expenditure. I may further take it as a premiss that the preparatory activity of expectation will not be independent of the magnitude of the impression that is expected, but that I shall represent its largeness or smallness mimetically by a larger or smaller preparatory expenditure, as in the case of making a communication and in the case of thinking unaccompanied by expectation. The expenditure on expectation is, however, put together from several components, and in the case of my disappointment, too, various points will be involved - not only whether what happens is perceptually greater or smaller than what is expected, but also whether it is worthy of the great interest which I had expended on the expectation. In this way I shall perhaps be led to take into account, besides the expenditure on the representation of large and small (the ideational mimetics), the expenditure on tightening the attention (the expenditure on expectation), and beyond this in other cases the expenditure on abstraction. But these other kinds of expenditure can easily be traced back to that on large and small, since what is more interesting, more sublime and even more abstract are only special cases, with particular qualities, of what is larger. If we consider in addition that, according to Lipps and other writers, *quantitative* (and not qualitative) contrast is to be regarded primarily as the source of comic pleasure, we shall on the whole feel glad that we chose the comic of movement as the starting-point of our enquiry.

Lipps, in the volume which has been so often quoted in these pages, has attempted, as an amplification to Kant's statement that the comic is 'an expectation that has turned to nothing', to derive comic pleasure quite generally from expectation. In spite, however, of the many instructive and valuable findings which this attempt has brought to light, I should like to support the criticism made by other authorities that Lipps has taken the field of origin of the comic far too narrowly and has been obliged to use great violence in order to bring its phenomena within the scope of his formula.

Mankind have not been content to enjoy the comic where they have come upon it in their experience; they have also sought to bring it about intentionally, and we can learn more about the nature of the comic if we study the means which serve to *make* things comic. First and foremost, it is possible to produce the comic in relation to oneself in order to amuse other people - for instance, by making oneself out clumsy or stupid. In that way one produces a comic effect exactly as though one really were these things, by fulfilling the condition of the comparison which leads to the difference in expenditure. But one does not in this way make oneself ridiculous or contemptible, but may in some circumstances even achieve admiration. The feeling of superiority does not arise in the other person if he knows that one has only been pretending; and this affords fresh evidence of the fundamental independence of the comic from the feeling of superiority.

As regards making *other people* comic, the principal means is to put them in situations in which a person becomes comic as a result of human dependence on external events, particularly on social factors, without regard to the personal characteristics of the individual concerned - that is to say, by employing the comic of situation. This putting of someone in a comic situation may be a *real* one (a practical joke¹) - by sticking out a leg so that someone trips over it as though he were clumsy, by making him seem stupid by exploiting his credulity, or trying to convince him of something nonsensical, and so on - or it may be simulated by speech or play. The aggressiveness, to which making a person comic usually ministers, is much assisted by the fact that the comic pleasure is independent of the reality of the comic situation, so that everyone is in fact exposed, without any defence, to being made comic.

¹ [In English in the original.]

But there are yet other means of making things comic which deserve special consideration and also indicate in part fresh sources of comic pleasure. Among these, for instance, is *mimicry*, which gives quite extraordinary pleasure to the hearer and makes its object comic even if it is still far from the exaggeration of a caricature. It is much easier to find a reason for the comic effect of *caricature* than for that of mere mimicry. Caricature, parody and travesty (as well as their practical counterpart, unmasking) are directed against people and objects which lay claim to authority and respect, which are in some sense '*sublime*'. They are procedures for *Herabsetzung*, as the apt German expression has it.¹ What is sublime is something large in the figurative, psychical sense; and I should like to suggest, or rather to repeat my suggestion, that, like what is somatically large, it is represented by an increased expenditure. It requires little observation to establish that when I speak of something sublime I innervate my speech in a different way, I make different facial expressions, and I try to bring the whole way in which I hold myself into harmony with the dignity of what I am having an idea of. I impose a solemn restraint upon myself - not very different from what I should adopt if I were to enter the presence of an exalted personality, a monarch, or a prince of science. I shall hardly be wrong in assuming that this different innervation in my ideational mimetics corresponds to an increased expenditure. The third instance of an increased expenditure of this kind is no doubt to be found when I proceed in abstract trains of thought instead of in the habitual concrete and plastic ones. When, therefore, the procedures that I have discussed for the degradation of the sublime allow me to have an idea of it as though it were something commonplace, in whose presence I need not pull myself together but may, to use the military formula, 'stand easy', I am being spared the increased expenditure of the solemn restraint; and the comparison between this new ideational method (instigated by empathy) and the previously habitual one, which is simultaneously trying to establish itself - this comparison once again creates the difference in expenditure which can be discharged by laughter.

¹ 'Degradation' [in English in the original]. Bain (1865, 248) writes: 'The occasion of the Ludicrous is the Degradation of some person or interest, possessing dignity, in circumstances that excite no other strong emotion.'

Caricature, as is well known, brings about degradation by emphasizing in the general impression given by the exalted object a single trait which is comic in itself but was bound to be overlooked so long as it was only perceivable in the general picture. By isolating this, a comic effect can be attained which extends in our memory over the whole object. This is subject to the condition that the actual presence of the exalted object himself does not keep us in a reverential attitude. If a comic trait of this kind that has been overlooked is lacking in reality, a caricature will unhesitatingly create it by exaggerating one that is not comic in itself; and the fact that the effect of the caricature is not essentially diminished by this falsification of reality is once again an indication of the origin of comic pleasure.

Parody and *travesty* achieve the degradation of something exalted in another way: by destroying the unity that exists between people's characters as we know them and their speeches and actions, by replacing either the exalted figures or their utterances by inferior ones. They are distinguished from caricature in this, but not in the mechanism of their production of comic pleasure. The same mechanism is also used for *unmasking*, which only applies where someone has seized dignity and authority by a deception and these have to be taken from him in reality. We have already met with a few examples of the comic effect of unmasking in jokes - for instance, in the story of the aristocratic lady who, at the first onset of her labour-pains, exclaimed 'Ah! mon Dieu!' but whom the doctor would not assist till she cried out 'Aa-ee, aa-ee!'. Having come to know the characteristics of the comic, we can no longer dispute that this anecdote is in fact an example of comic unmasking and has no justifiable claim to be called a joke. It only recalls jokes by its setting and by the technical method of 'representation by something very small' - in this case the patient's cry, which is found sufficient to establish the indication for treatment. It nevertheless remains true that our linguistic sense, if we call on it for a decision, raises no objection to our calling a story like this a joke. We may explain this by reflecting that linguistic usage is not based on the scientific insight into the nature of jokes that we have arrived at in this laborious investigation. Since one of the functions of jokes is to make hidden sources of comic pleasure accessible once more (p. 1698), any device that brings to light something that is not manifestly comic may, by a loose analogy, be termed a joke. This applies preferably, however, to unmasking as well as to other methods of making people comic.¹

¹ 'Thus every conscious and ingenious evocation of the comic (whether the comic of contemplation or of situation) is in general described as a joke. We, of course, cannot here make use of this concept of the joke either.' (Lipps, 1898, 78.)

Under the heading of 'unmasking' we may also include a procedure for making things comic with which we are already acquainted - the method of degrading the dignity of individuals by directing attention to the frailties which they share with all humanity, but in particular the dependence of their mental functions on bodily needs. The unmasking is equivalent here to an admonition: such and such a person, who is admired as a demigod, is after all only human like you and me. Here, too, are to be placed the efforts at laying bare the monotonous psychical automatism that lies behind the wealth and apparent freedom of psychical functions. We came across examples of 'unmasking' of this kind in the marriage-broker jokes, and felt a doubt at the time whether these anecdotes have a right to be counted as jokes. We are now able to decide with greater certainty that the anecdote of the echo who reinforced all the assertions of the marriage-broker and finally confirmed his admission that the bride had a hump with the exclamation 'And *what* a hump!' - that this anecdote is essentially a *comic* story, an example of the unmasking of a psychical automatism. Here, however, the comic story is only serving as a façade. For anyone who will attend to the hidden meaning of the marriage-broker anecdotes, the whole thing remains an admirably staged joke; anyone who does not penetrate so far is left with a comic story. The same thing applies to the other joke, about the marriage-broker who, in order to answer an objection, ended by confessing the truth with a cry of 'But I ask you, who would lend such people anything?'. Here again we have a comic unmasking as the façade for a joke, though in this instance the characteristic of a joke is much more unmistakable, since the marriage-broker's remark is at the same time a representation by the opposite. In trying to prove that the people are rich he at the same time proves that they are *not* rich, but very poor. Here a joke and the comic are combined, and teach us that the same remark can be both things at once.

We are glad to seize the opportunity of returning to jokes from the comic of unmasking, since our true problem is not to determine the nature of the comic but to throw light on the relation between jokes and the comic. We have discussed the uncovering of psychical automatism, in a case in which our feeling as to whether something is comic or a joke left us in the lurch. And we will now add another case in which there is a similar confusion between jokes and the comic - the case of nonsensical jokes. But our investigation will show us in the end that as regards this second case the convergence between jokes and the comic can be theoretically accounted for.

In discussing the techniques of jokes we found that giving free play to modes of thought which are usual in the unconscious but which can only be judged as examples of 'faulty reasoning' in the conscious is the technical method adopted in many jokes; and about these, once again, we felt doubts whether they possessed the true character of jokes, so that we were inclined to classify them simply as comic stories. We were unable to reach a decision about our doubts because at the time we were ignorant of the essential characteristic of jokes. Subsequently, led by an analogy with the dream-work, we discovered that it lay in the compromise effected by the joke-work between the demands of reasonable criticism and the urge not to renounce the ancient pleasure in words and nonsense. What came about in this way as a compromise, when the preconscious start of the thought was left for a moment to unconscious revision, satisfied both claims in every instance, but presented itself to criticism in various forms and had to put up with various judgements at its hands. Sometimes a joke would succeed in slipping on the appearance of an insignificant but nevertheless permissible assertion, another time it would smuggle itself in as the expression of a valuable thought. But, in the marginal case of effecting a compromise, it would give up attempting to satisfy criticism. Boasting of the sources of pleasure at its command, it would appear before criticism as sheer nonsense and not be afraid to provoke contradiction from it; for the joke could reckon on the hearer straightening out the disfigurement in the form of its expression by unconscious revision and so giving it back its meaning.

In what instances, then, will a joke appear before criticism as nonsense? Particularly when it makes use of the modes of thought which are usual in the unconscious but are proscribed in conscious thought - faulty reasoning, in fact. For certain modes of thought proper to the unconscious have also been retained by the conscious - for instance, some kinds of indirect representation, allusion, and so on - even though their conscious employment is subject to considerable restrictions. When a joke makes use of these techniques it will raise little or no objection on the part of criticism; objections will only appear if it also makes use for its technique of the methods with which conscious thought will have nothing more to do. A joke can still avoid objection, if it conceals the faulty reasoning it has used and disguises it under a show of logic, as happened in the anecdotes of the cake and the liqueur, of the salmon mayonnaise, and similar ones. But if it produces the faulty reasoning undisguised, then the objections of criticism will follow with certainty.

In such cases the joke has another resource. The faulty reasoning, which it uses for its technique as one of the modes of thought of the unconscious, strikes criticism - even though not invariably so - as being *comic*. Consciously giving free play to unconscious modes of thought (which have been rejected as faulty) is a means of producing comic pleasure; and it is easy to understand this, since it certainly requires a greater expenditure of energy to establish a preconscious cathexis than to give free play to an unconscious one. When, on hearing a thought which has, as it were, been formed in the unconscious, we compare it with its correction, a difference in expenditure emerges for us from which comic pleasure arises. A joke which makes use of faulty reasoning like this for its technique, and therefore appears nonsensical, can thus produce a comic effect at the same time. If we fail to detect the joke, we are once again left with only the comic or funny story.

The story of the borrowed kettle which had a hole in it when it was given back (p. 1664) is an excellent example of the purely comic effect of giving free play to the unconscious mode of thought. It will be recalled that the borrower, when he was questioned, replied firstly that he had not borrowed a kettle at all, secondly that it had had a hole in it already when he borrowed it, and thirdly that he had given it back undamaged and without a hole. This mutual cancelling-out by several thoughts, each of which is in itself valid, is precisely what does not occur in the unconscious. In dreams, in which the modes of thought of the unconscious are actually manifest, there is accordingly no such thing as an 'either-or',¹ only a simultaneous juxtaposition. In the example of a dream, which, in spite of its complication, I chose in my *Interpretation of Dreams* as a specimen of the work of interpretation, I tried to rid myself of the reproach of having failed to relieve a patient of her pains by psychical treatment. My reasons were: (1) that she herself was responsible for her illness because she would not accept my solution, (2) that her pains were of organic origin and were therefore no concern of mine, (3) that her pains were connected with her widowhood, for which I was evidently not responsible and (4) that her pains were due to an injection from a contaminated syringe, which had been given her by someone else. All these reasons stood side by side, as though they were not mutually exclusive. I was obliged to replace the 'and' of the dream by an 'either-or' in order to escape a charge of nonsense.

There is a similar comic story of a Hungarian village in which the blacksmith had been guilty of a capital offence. The burgomaster, however, decided that as a penalty a *tailor* should be hanged and not the blacksmith, because there were two tailors in the village but no second blacksmith, and the crime must be expiated. A displacement of this kind from the figure of the guilty person to another naturally contradicts every law of conscious logic but by no means the mode of thought of the unconscious. I do not hesitate to call this story comic, and yet I have included the one about the kettle among the jokes. I will now admit that this latter story too is far more correctly described as 'comic' rather than as a joke. But I now understand how it is that my feeling, which is as a rule so sure, can leave me in doubt as to whether this story is comic or a joke. This is a case in which I cannot come to a decision on the basis of my feeling - when, that is, the comic arises from the uncovering of a mode of thought that is exclusively proper to the unconscious. A story like this may be comic and a joke at the same time; but it will give me the impression of being a joke, even if it is merely comic, because the use of the faulty reasoning of the unconscious reminds me of jokes, just as did the manoeuvres for uncovering what is not manifestly comic (p. 1781).

I set great store by clarifying this most delicate point in my arguments - the relation of jokes to the comic; and I will therefore supplement what I have said with a few negative statements. I may first draw attention to the fact that the instance of the convergence of jokes and the comic which I am dealing with here is not identical with the former one (p. 1781). It is true that the distinction is a rather narrow one, but it can be made with certainty. In the earlier case the comic arose from the uncovering of psychical automatism. This, however, is by no means peculiar to the unconscious alone, nor does it play any striking part in the technique of jokes. Unmasking only comes into relation with jokes accidentally, when it serves some other joke-technique, such as representation by the opposite. But in the case of giving free play to unconscious modes of thought the convergence of jokes and the comic is a *necessary* one, since the same method which is used here by the first person of the joke as a technique for releasing pleasure must from its very nature produce comic pleasure in the third person.

¹ At the most, it is introduced by the narrator by way of interpretation.

One might be tempted to generalize from this last case and look for the relation of jokes to the comic in the notion that the effect of jokes on the third person takes place according to the mechanism of comic pleasure. But there is no question of this being so. Contact with the comic is by no means to be found in all jokes or even in the majority of them; in most cases, on the contrary, a clear distinction is to be made between jokes and the comic. Whenever a joke succeeds in escaping the appearance of nonsense - that is, in most jokes accompanied by double meaning and allusion - there is no trace to be found in the hearer of any effect resembling the comic. This may be tested in the examples I have given earlier, or on a few new ones that I can bring up:

Telegram of congratulations to a gambler on his seventieth Birthday: '*Trente et quarante*.' (Dividing-up with allusion.)

Hevesi somewhere describes the process of tobacco manufacture: 'The bright yellow leaves . . . were dipped in a sauce and were sauced in this dip.' (Multiple use of the same material).

Madame de Maintenon was known as 'Madame de *Maintenant*'. (Modification of a name.)

Professor Kästner said to a prince who stood in front of a telescope during a demonstration: 'Your Highness, I know quite well that you are "*durchläuchtig* [illustrious]',¹ but you are not "*durchsigtig* [transparent].'"

Count Andrásy was known as 'Minister of the Fine Exterior'.

It might further be thought that at any rate all jokes with a façade of nonsense will seem comic and must produce a comic affect. But I must recall that jokes of this kind very often affect the hearer in another way and provoke bewilderment and a tendency to repudiation (see p. 1727 *n.*). Thus it evidently depends on whether the nonsense of a joke appears as comic or as sheer ordinary nonsense - and we have not yet investigated what determines this. We therefore stick to our conclusion that jokes are from their nature to be distinguished from the comic and only converge with it, on the one hand in certain special cases, and on the other hand in their aim of obtaining pleasure from intellectual sources.

During these enquiries into the relations between jokes and the comic the distinction has become plain to us which we must emphasize as the most important and which points at the same time to a main psychological characteristic of the comic. We found ourselves obliged to locate the pleasure in jokes in the unconscious; no reason is to be found for making the same localization in the case of the comic. On the contrary, all the analyses we have hitherto made have pointed to the source of comic pleasure being a comparison between two expenditures both of which must be ascribed to the preconscious. Jokes and the comic are distinguished first and foremost in their psychical localization; *the joke, it may be said, is the contribution made to the comic from the realm of the unconscious.*

¹ [An adjective derived from '*Durchlaucht*', a title applied to minor royalty: 'Serene Highness'.]

There is no need to apologize for this digression, since the relation of jokes to the comic was the reason for our being forced into an investigation of the comic. But it is certainly time we returned to our previous topic - the discussion of the methods which serve for making things comic. We considered caricature and unmasking first, because we can derive some indications from these two for the analysis of the comic of *mimicry*. As a rule, no doubt, mimicry is permeated with caricature - the exaggeration of traits that are not otherwise striking -, and it also involves the characteristic of degradation. But this does not seem to exhaust its nature. It cannot be disputed that it is in itself an extraordinarily fertile source of comic pleasure, for we laugh particularly at the *faithfulness* of a piece of mimicry. It is not easy to give a satisfactory explanation of this unless one is prepared to adopt the view held by Bergson (1900), which approximates the comic of mimicry to the comic due to the discovery of psychical automatism. Bergson's opinion is that everything in a living person that makes one think of an inanimate mechanism has a comic effect. His formula for this runs '*mécanisation de la vie*'. He explains the comic of mimicry by starting out from a problem raised by Pascal in his *Pensées* of why it is that one laughs when one compares two similar faces neither of which has a comic effect by itself. 'What is living should never, according to our expectation, be repeated exactly the same. When we find such a repetition we always suspect some mechanism lying behind the living thing.' When one sees two faces that resemble each other closely, one thinks of two impressions from the same mould or of some similar mechanical procedure. In short, the cause of laughter in such cases would be the divergence of the living from the inanimate, or, as we might say, the degradation of the living to the inanimate (ibid., 35). If, moreover, we were to accept these plausible suggestions of Bergson's, we should not find it difficult to include his view under our own formula. Experience has taught us that every living thing is different from every other and calls for a kind of expenditure by our understanding; and we find ourselves disappointed if, as a result of complete conformity or deceptive mimicry, we need make no fresh expenditure. But we are disappointed in the sense of a relief, and the expenditure on expectation which has become superfluous is discharged by laughter. The same formula would also cover all the cases which Bergson considers of comic rigidity ('*raideur*'), of professional customs, fixed ideas, and turns of speech repeated on every possible occasion. All these cases would go back to a comparison between the expenditure on expectation and the expenditure actually required for an understanding of something that has remained the same; and the larger amount needed for expectation would be based on observation of the multiplicity and plasticity of living things. In the case of mimicry, accordingly, the source of the comic pleasure would be not the comic of situation but of expectation.

Since we derive comic pleasure in general from a comparison, it is incumbent on us to examine the comic of comparison itself; and this, indeed, serves as a method of making things comic. Our interest in this question will be increased when we recall that in the case of analogies, too, we often found that our 'feeling' left us in the lurch as to whether something was to be called a joke or merely comic (p. 1680 f.).

The subject would, it must be admitted, deserve more careful treatment than our interests can devote to it. The main attribute that we enquire after in an analogy is whether it is apt - that is, whether it draws attention to a conformity which is really present in two different objects. The original pleasure in rediscovering the same thing (Groos, 1899, 153) is not the only motive that favours the use of analogies; there is the further fact that analogies are capable of a use which brings with it a relief of intellectual work - if, that is to say, one follows the usual practice of comparing what is less known with what is better known or the abstract with the concrete, and by the comparison elucidates what is more unfamiliar or more difficult. Every such comparison, especially of something abstract with something concrete, involves a certain degradation and a certain economy in expenditure on abstraction (in the sense of ideational mimetics), but this is of course not sufficient to allow the characteristic of the comic to come clearly into prominence. It does not emerge suddenly but gradually from the pleasure of the relief brought about by the comparison. There are plenty of cases which merely fringe on the comic and in which doubt might be felt whether they show the characteristic of the comic. The comparison becomes undoubtedly comic if there is a rise in the level of difference between the expenditure on abstraction in the two things that are being compared, if something serious and unfamiliar, especially if it is of an intellectual or moral nature, is brought into comparison with something commonplace and inferior. The previous pleasure of the relief and the contribution from the determinants of ideational mimetics may perhaps explain the gradual transition, conditioned by quantitative factors, from general pleasure to comic pleasure during the comparison. I shall no doubt avoid misunderstandings if I stress the fact that I do not trace the comic pleasure in analogies to the contrast between the two things compared but to the difference between the two expenditures on abstraction. When an unfamiliar thing that is hard to take in, a thing that is abstract and in fact sublime in an intellectual sense, is alleged to tally with something familiar and inferior, in imagining which there is a complete absence of any expenditure on abstraction, then that abstract thing is itself unmasked as something equally inferior. The comic of comparison is thus reduced to a case of degradation.

A comparison can, however, as we have already seen, be in the nature of a joke, without a trace of comic admixture - precisely, that is, when it avoids degradation. Thus the comparison of truth with a torch that cannot be carried through a crowd without singeing someone's beard is purely in the nature of a joke, because it takes a watered-down turn of speech ('the torch of truth') at its full value, and it is not comic, because a torch as an object, though it is a concrete thing, is not without a certain distinction. But a comparison can just as easily be a joke and comic as well, and can be each independently of the other, since a comparison can be of help to certain techniques of jokes, such as unification or allusion. In this way Nestroy's comparison of memory to a 'warehouse' (p. 1683) is at once comic and a joke - the former because of the extraordinary degradation which the psychological concept has to put up with in being compared to a 'warehouse', and the latter because the person making use of the comparison is a clerk, who thus establishes in the comparison a quite unexpected unification between psychology and his profession. Heine's phrase 'till at last all the buttons burst on the breeches of my patience' seems at first sight to be no more than a remarkable example of a comically degrading comparison; but on further consideration we must also allow it the characteristics of a joke, since the comparison, as a means of allusion, impinges on the region of the obscene and so succeeds in liberating pleasure in the obscene. The same material, by what is admittedly not an entirely chance coincidence, provides us with a yield of pleasure which is simultaneously comic and of the character of a joke. If the conditions of the one favour the generation of the other, their union has a confusing effect on the 'feeling' which is supposed to tell us whether we are being offered a joke or something comic, and a decision can only be arrived at by an attentive investigation that has been freed from any predisposition to a particular kind of pleasure.

However attractive it may be to follow up these more intimate determinants of the yield of comic pleasure, the author must bear in mind that neither his education nor his daily occupation justify his extending his enquiries far beyond the sphere of jokes; and he must confess that the topic of comic comparisons makes him particularly aware of his inability.

We therefore readily recall that many authorities do not recognize the sharp conceptual and material distinction between jokes and the comic to which we have found ourselves led, and that they regard jokes as simply 'the comic of speech' or 'of words'. In order to test this view we will choose one example each of something intentionally and of something involuntarily comic in words to compare with jokes. We have remarked earlier that we believe ourselves very well able to distinguish a comic remark from a joke:

'With a fork and much to-do
His mother dragged him from the stew'

is merely comic; Heine's remark about the four castes among the inhabitants of Göttingen - 'professors, students, philistines and donkeys' is *par excellence* a joke.

For something intentionally comic I will take as a model Stettenheim's 'Wippchen'. People speak of Stettenheim as 'witty' because he possesses to a special degree the gift of evoking the comic. This capacity does in fact aptly determine the 'wit' that one 'has' in contrast to the 'joke' that one 'makes'.¹ It cannot be disputed that the letters of Wippchen, the Correspondent from Bernau, are also 'witty' in so far as they are abundantly sprinkled with jokes of every kind, among them some that are genuinely successful (e.g. of a display by savages: 'in ceremonial undress'). But what gives these productions their peculiar character is not these separate jokes but the almost too abundant comic of speech which flows through them. 'Wippchen' was no doubt originally intended as a satirical figure, a modification of Gustav Freytag's 'Schmock', one of those uneducated people who misuse and trade away the nation's store of culture; but the author's enjoyment of the comic effects achieved in his picture of this character has evidently pushed the satirical purpose little by little into the background. Wippchen's productions are for the most part 'comic nonsense'. The author has made use of the pleasurable mood brought about by the piling up of these successes to introduce (justifiably, it must be said), alongside perfectly permissible material, all kinds of insipidities which could not be tolerated on their own account. Wippchen's nonsense produces a specific effect on account of a peculiar technique. If one looks more closely at these 'jokes' one is specially struck by a few kinds which give the whole production its stamp. Wippchen makes use predominantly of combinations (amalgamations), modifications of familiar turns of speech and quotations and replacements of a few commonplace elements in them by more pretentious and weighty forms of expression. This incidentally is coming near to the techniques of jokes.

¹ [The same German word 'Witz' is used here for both 'wit' and 'joke'.]

Here, for instance, are some amalgamations (taken from the preface and the first pages of the whole series):

'Turkey has money *wie Heu am Meere*.' This is made up of the two expressions: 'Money *wie Heu*' and 'Money *wie Sand am Meer*'.¹

Or, 'I am no more than a column stripped of its leaves,² which bears witness to its vanished glory' - condensed from 'a tree stripped of its leaves' and 'a column which . . . etc.'

Or, 'Where is the thread of Ariadne which will lead me from the Scylla of this Augean stable?' to which three Greek legends have each contributed an element.

The modifications and substitutions can be summarized without much difficulty. Their nature can be seen from the following examples, which are characteristic of Wippchen and behind which we have a glimpse of another, more current and usually more commonplace wording, which has been reduced to a *cliché*:

'*Mier Papier und Tinte höher zu hängen*.' We use the phrase '*einem den Brotkorb höher hängen*' metaphorically for 'to put someone in more difficult circumstances'. So why should not the metaphor be extended to other material?

¹ [These are two common expressions in German, equivalent to 'money like dirt' or 'oceans of money'.]

² ['*Eine entlaubte Säule*' - an echo of '*Eine entleibte Seele*', 'a disembodied spirit'.]

'Battles in which the Russians sometimes draw the shorter and sometimes the longer.' Only the first of these expressions ['*den Kürzeren ziehen*', 'draw the shorter'] is in common use; but in view of its derivation there would be no absurdity in bringing the second into use as well.

'While I was still young, Pegasus stirred within me.' If we put back 'the poet' instead of 'Pegasus' we find an autobiographical *cliché* well-worn by frequent use. It is true that 'Pegasus' is not a suitable substitute for 'the poet', but it has a conceptual relation with it and is a high-sounding word.

'Thus I lived through the thorny shoes of childhood.' A simile instead of a simple statement. '*Die Kinderschuhe austreten*' ['to wear out the shoes of childhood', 'to leave the nursery behind'] is one of the images connected with the concept of childhood.

From the profusion of Wippchen's other productions some can be stressed as pure examples of the comic. For instance, as a comic disappointment: 'For hours the fight fluctuated, until at last it remained undecided.' Or, as a comic unmasking (of ignorance): 'Clio, the Medusa of History.' Or quotations such as: '*Habent sua fata morgana*.'¹ But our interest is more aroused by the amalgamations and modifications, because they repeat familiar joke-techniques. We may, for instance, compare with the modifications such jokes as 'he has a great future behind him', or '*er hat ein Ideal vor dem Kopf*', or Lichtenberg's modification joke 'new spas cure well', and so on. Are Wippchen's productions which have the same technique now to be called jokes? or how do they differ from these?

¹ [*Habent sua fata libelli* (books have their destinies) is a Latin saying attributed to Terence. '*Fata Morgana*' is the Italian name for a particular kind of mirage seen in the Straits of Messina: from Morgan le Fey (fairy), King Arthur's sister.]

It is not difficult to answer. Let us recall that jokes present a double face to their hearer, force him to adopt two different views of them. In a nonsense joke, like the ones last mentioned, the one view, which only takes the wording into account, regards it as nonsense; the other view, following the hints that are given, passes through the hearer's unconscious and finds an excellent sense in it. In Wippchen's joke-like productions one face of the joke is blank, as though it were rudimentary: a Janus head but with only one face developed on it. If we allow the technique to lure us into the unconscious, we come upon nothing. The amalgamations lead us to no instance in which the two things that are amalgamated really yield a new meaning; if we attempt an analysis, they fall completely apart. The modifications and substitutions lead, as they do in jokes, to a usual and familiar wording; but the modification or substitution itself tells us nothing fresh and as a rule, indeed, nothing possible or serviceable. So that only the one view of these 'jokes' is left over - that they are nonsense. We can merely decide whether we choose to call such productions, which have freed themselves from one of the most essential characteristics of jokes, 'bad' jokes or not jokes at all.

Rudimentary jokes of this kind undoubtedly produce a comic effect, which we can account for in more than one way. Either the comic arises from the uncovering of the modes of thought of the unconscious, as in cases we considered earlier, or the pleasure comes from the comparison with a complete joke. Nothing prevents our supposing that both these ways of generating comic pleasure converge here. It is not impossible that here the inadequacy of support from a joke is precisely what makes the nonsense into comic nonsense.

For there are other easily intelligible cases in which inadequacy of this kind as compared with what ought to be effected makes the nonsense irresistibly comic. The counterpart of jokes - riddles - can perhaps offer us better examples of this than jokes themselves. For instance, here is a 'facetious question': 'What is it that hangs on the wall and that one can dry one's hands on?' It would be a stupid riddle if the answer were 'a hand-towel'. But that answer is rejected. - 'No, a herring.' - 'But for heaven's sake', comes the infuriated protest 'a herring doesn't hang on the wall.' - 'You *can* hang it up there.' - 'But who in the world is going to dry his hands on a herring?' - 'Well', is the soothing reply, 'you don't *have* to.' This explanation, given by means of two typical displacements, shows how far this question falls short of a genuine riddle; and on account of its absolute inadequacy it strikes us as being - instead of simply nonsensically stupid - irresistibly comic. In this way, by failing to comply with essential conditions, jokes, riddles, and other things, which do not produce comic pleasure in themselves, are made into sources of comic pleasure.

There is still less difficulty in understanding the case of the *involuntary* comic of speech, which we can find realized as often as we please in, for instance, the poems of Friederike Kempner (1891):

Against Vivisection

Ein unbekanntes Band der Seelen kettet
Den Menschen an das arme Tier.
Das Tier hat einen Willen - ergo Seele -
Wenn auch 'ne kleinere als wir.¹

Or a conversation between a loving married couple:

The Contrast

'Wie glücklich bin ich', ruft sie leise,
'Auch ich', sagt lauter ihr Gemahl,
'Es macht mich deine Art und Weise
Sehr stolz auf meine gute Wahl!' ²

There is nothing here to make us think of jokes. But there is no doubt that it is the inadequacy of these 'poems' that makes them comic - the quite extraordinary clumsiness of their expression, which is linked with the tritest or most journalistic turns of phrase, the simple-minded limitation of their thought, the absence of any trace of poetic matter or form. In spite of all this, however, it is not obvious why we find Kempner's poems comic. We find many similar products nothing but shockingly bad; they do not make us laugh but annoy us. But it is precisely the greatness of the distance that separates them from what we expect of a poem that imposes the comic view on us; if this difference struck us as smaller we should be more inclined to criticize than to laugh. Furthermore, the comic effect of Kempner's poems is assured by a subsidiary circumstance - the authoress's unmistakably good intentions and a peculiar sincerity of feeling which disarms our ridicule or our annoyance and which we sense behind her helpless phrases.

Here we are reminded of a problem whose consideration we have postponed. Difference in expenditure is undoubtedly the basic determining condition of comic pleasure; but observation shows that this difference does not invariably give rise to pleasure. What further conditions must be present or what disturbances must be kept back, in order that comic pleasure may actually arise from the difference in expenditure? Before we turn to answering this question, we will conclude this discussion with a clear assertion that the comic of speech does not coincide with jokes, and that jokes must therefore be something other than the comic of speech.

¹ [Between mankind and poor dumb beasts there stretches
A chain of souls impossible to see.
Poor dumb beasts have a will - *ergo* a soul too -
E'en though they have a soul smaller than we.]

² ['How fortunate am I!' she softly cried.
'I too', declared her husband's louder voice:
'Your many qualities fill me with pride
At having made so excellent a choice.']

Now that we are on the point of approaching an answer to our last question, as to the necessary conditions for the generating of comic pleasure from the difference in expenditure, we may allow ourselves a relief which cannot fail to give us pleasure. An accurate reply to the question would be identical with an exhaustive account of the nature of the comic, for which we can claim neither capacity nor authority. We shall once more be content to throw light on the problem of the comic only so far as it contrasts clearly with the problem of jokes.

Every theory of the comic is objected to by its critics on the score that its definition overlooks what is essential to the comic; 'The comic is based on a contrast between ideas.' 'Yes, in so far as the contrast has a comic and not some other effect.' 'The feeling of the comic arises from the disappointment of an expectation.' 'Yes, unless the disappointment is in fact a distressing one.' No doubt the objections are justified; but we shall be over-estimating them if we conclude from them that the essential feature of the comic has hitherto escaped detection. What impairs the universal validity of these definitions are conditions which are indispensable for the generating of comic pleasure; but we do not need to look for the essence of the comic in them. In any case, it will only become easy for us to dismiss the objections and throw light on the contradictions to the definitions of the comic if we suppose that the origin of comic pleasure lies in a comparison of the difference between two expenditures. Comic pleasure and the effect by which it is known - laughter - can only come about if this difference is unutilizable and capable of discharge. We obtain no pleasurable effect but at most a transient sense of pleasure in which the characteristic of being comic does not emerge, if the difference is put to another use as soon as it is recognized. Just as special contrivances have to be adopted in the case of jokes in order to prevent the use elsewhere of the expenditure that is recognized as superfluous, so, too, comic pleasure can only appear in circumstances that guarantee this same condition. For this reason occasions on which these differences in expenditure occur in our ideational life are uncommonly numerous, but the occasions on which the comic emerges from those differences are relatively quite rare.

Two observations force themselves on anyone who studies even cursorily the conditions for the generation of the comic from difference in expenditure. Firstly, there are cases in which the comic appears habitually and as though by force of necessity, and on the contrary others in which it seems entirely dependent on the circumstances and on the standpoint of the observer. But secondly, unusually large differences very often break through unfavourable conditions, so that the comic feeling emerges in spite of them. In connection with the first of these points it would be possible to set up two classes - the inevitably comic and the occasionally comic - though one must be prepared from the first to renounce the notion of finding the inevitability of the comic in the first class free from exceptions. It would be tempting to enquire into the determining conditions for the two classes.

The conditions, some of which have been brought together as the 'isolation' of the comic situation, apply essentially to the second class. A closer analysis elicits the following facts:

(a) The most favourable condition for the production of comic pleasure is a generally cheerful mood in which one is 'inclined to laugh'. In a toxic mood of cheerfulness almost everything seems comic, probably by comparison with the expenditure in a normal state. Indeed, jokes, the comic and all similar methods of getting pleasure from mental activity are no more than ways of regaining this cheerful mood - this euphoria - from a single point of approach, when it is not present as a general disposition of the psyche.

(b) A similarly favourable effect is produced by an *expectation* of the comic, by being attuned to comic pleasure. For this reason, if an intention to make something comic is communicated to one by someone else, differences of such a low degree are sufficient that they would probably be overlooked if they occurred in one's experience unintentionally. Anyone who starts out to read a comic book or goes to the theatre to see a farce owes to this intention his ability to laugh at things which would scarcely have provided him with a case of the comic in his ordinary life. In the last resort it is in the recollection of having laughed and in the expectation of laughing that he laughs when he sees the comic actor come on to the stage, before the latter can have made any attempt at making him laugh. For that reason, too, one admits feeling ashamed afterwards over what one has been able to laugh at the play.

(c) Unfavourable conditions for the comic arise from the kind of mental activity with which a particular person is occupied at the moment. Imaginative or intellectual work that pursues serious aims interferes with the capacity of the cathexes for discharge - cathexes which the work requires for its displacements - so that only unexpectedly large differences in expenditure are able to break through to comic pleasure. What are quite specially unfavourable for the comic are all kinds of intellectual processes which are sufficiently remote from what is perceptual to bring ideational mimetics to a stop. There is no place whatever left for the comic in abstract reflection except when that mode of thought is suddenly interrupted.

(d) The opportunity for the release of comic pleasure disappears, too, if the attention is focused precisely on the comparison from which the comic may emerge. In such circumstances what would otherwise have the most certain comic effect loses its comic force. A movement or a function cannot be comic for a person whose interest is directed to comparing it with a standard which he has clearly before his mind. Thus the examiner does not find the nonsense comic which the candidate produces in his ignorance; he is annoyed by it, while the candidate's fellow students, who are far more interested in what luck he will have than in how much he knows, laugh heartily at the same nonsense. A gymnastic or dancing instructor seldom has an eye for the comic in his pupils' movements; and a clergyman entirely overlooks the comic in the human weaknesses which the writer of comedies can bring to light so effectively. The comic process will not bear being hypercathected by attention; it must be able to take its course quite unobserved in this respect, incidentally, just like jokes. It would, however, contradict the nomenclature of the 'processes of consciousness' of which I made use, with good reason, in my *Interpretation of Dreams* if one sought to speak of the comic process as a necessarily unconscious one. It forms part, rather, of the preconscious; and such processes, which run their course in the preconscious but lack the cathexis of attention with which consciousness is linked, may aptly be given the name of 'automatic'. The process of comparing expenditures must remain automatic if it is to produce comic pleasure.

(e) The comic is greatly interfered with if the situation from which it ought to develop gives rise at the same time to a release of strong affect. A discharge of the operative difference is as a rule out of the question in such a case. The affects, disposition and attitude of the individual in each particular case make it understandable that the comic emerges and vanishes according to the standpoint of each particular person, and that an absolute comic exists only in exceptional instances. The contingency or relativity of the comic is therefore far greater than that of a joke, which never happens of its own accord but is invariably *made*, and in which the conditions under which it can find acceptance can be observed at the time at which it is constructed. The generation of affect is the most intense of all the conditions that interfere with the comic and its importance in this respect has been nowhere overlooked.¹ For this reason it has been said that the comic feeling comes easiest in more or less indifferent cases where the feelings and interests are not strongly involved. Yet precisely in cases where there is a release of affect one can observe a particularly strong difference in expenditure bring about the automatism of release. When Colonel Butler answers Octavio's warnings by exclaiming 'with a bitter laugh': '*Thanks* from the House of Austria!', his embitterment does not prevent his laughing. The laugh applies to his memory of the disappointment he believes he has suffered; and on the other hand the magnitude of the disappointment cannot be portrayed more impressively by the dramatist than by his showing it capable of forcing a laugh in the midst of the storm of feelings that have been released. I am inclined to think that this explanation would apply to every case in which laughter occurs in circumstances other than pleasurable ones and accompanied by intensely distressing or strained emotions.

(f) If we add to this that the generating of comic pleasure can be encouraged by any other pleasurable accompanying circumstance as though by some sort of contagious effect (working in the same kind of way as the fore-pleasure principle with tendentious jokes), we shall have mentioned enough of the conditions governing comic pleasure for our purposes, though certainly not all of them. We can then see that these conditions, as well as the inconstancy and contingency of the comic effect, cannot be explained so easily by any other hypothesis than that of the derivation of comic pleasure from the discharge of a difference which, under the most varying circumstances, is liable to be used in ways other than discharge.

¹ 'It is easy for you to laugh; it means nothing more to you.'

The comic of sexuality and obscenity would deserve more detailed consideration; but we can only touch upon it here with a few comments. The starting-point would once more be exposure. A chance exposure has a comic effect on us because we compare the ease with which we have enjoyed the sight with the great expenditure which would otherwise be required for reaching this end. Thus the case approaches that of the naïvely comic, but is simpler. Every exposure of which we are made the spectator (or audience in the case of smut) by a third person is equivalent to the exposed person being made comic. We have seen that it is the task of jokes to take the place of smut and so once more to open access to a lost source of comic pleasure. As opposed to this, witnessing an exposure is not a case of the comic for the witness, because his own effort in doing so does away with the determining condition of comic pleasure: nothing is left but the sexual pleasure in what is seen. If the witness gives an account to someone else, the person who has been witnessed becomes comic once more, because there is a predominant sense that the latter has omitted the expenditure which would have been in place for concealing his secret. Apart from this, the spheres of sexuality and obscenity offer the amplest occasions for obtaining comic pleasure alongside pleasurable sexual excitement; for they can show human beings in their dependence on bodily needs (degradation) or they can reveal the physical demands lying behind the claim of mental love (unmasking).

An invitation to us to look for an understanding of the comic in its psychogenesis is also to be found, surprisingly enough, in Bergson's charming and lively volume *Le rire*. We have already made the acquaintance of Bergson's formulas for grasping the characteristics of the comic: '*mécanisation de la vie*', '*substitution quelconque de l'artificial au naturel*'.¹ He proceeds by a plausible train of thought from automatism to automata, and tries to trace back a number of comic effects to the faded recollection of a children's toy. In this connection he reaches for a moment a point of view, which, it is true, he soon abandons: he endeavours to explain the comic as an after-effect of the joys of childhood. 'Peut-être même devrions-nous pousser la simplification plus loin encore, remonter à nos souvenirs les plus anciens, chercher dans les jeux qui amusèrent l'enfant la première ébauche des combinaisons qui font rire l'homme . . . Trop souvent surtout nous méconnaissons ce qu'il y a d'encore enfantin, pour ainsi dire, dans la plupart de nos émotions joyeuses.' (Bergson, 1900, 68 ff.)² Since we have traced back jokes to children's play with words and thoughts which has been frustrated by rational criticism we cannot help feeling tempted to investigate the infantile roots which Bergson suspects in the case of the comic as well.

¹ ['Mechanization of life' - 'some kind of substitution of the artificial for the natural.']

² ['Perhaps we should even carry simplification further still, go back to our oldest memories, and trace in the games that amused the child the first sketch of the combinations which make the grown man laugh . . . Above all, we too often fail to recognize how much of childishness, so to speak, there still is in most of our joyful emotions.']

And, in fact, if we examine the relation of the comic to the child we come upon a whole number of connections which seem promising. Children themselves do not strike us as in any way comic, though their nature fulfils all the conditions which, if we compare it with our own nature, yield a comic difference: the excessive expenditure on movement as well as the small intellectual expenditure, the domination of the mental functions by the bodily ones, and other features. A child only produces a comic effect on us when he conducts himself not as a child but as a serious adult, and he produces it then in the same way as other people who disguise themselves. But so long as he retains his childish nature the perception of him affords us a pure pleasure, perhaps one that reminds us slightly of the comic. We call him naïve, in so far as he shows us his lack of inhibition, and we describe as naïvely comic those of his utterances which in another person we should have judged obscenities or jokes.

On the other hand, children are without a feeling for the comic. This assertion seems to say no more than that the comic feeling, like such a number of other things, only starts at some point in the course of mental development; and this would be by no means surprising, especially as it has to be admitted that the feeling already emerges clearly at an age which has to be counted as part of childhood. But it can nevertheless be shown that the assertion that children lack the feeling of the comic contains more than something self-evident. In the first place, it is easy to see that it could not be otherwise if our view is correct which derives the comic feeling from a difference in expenditure that arises in the course of understanding another person. Let us once again take the comic of movement as an example. The comparison which provides the difference runs (stated in conscious formulas): 'That is how he does it' and 'This is how I should do it, how I did it'. But a child is without the standard contained in the second sentence; he understands simply by mimicry: he does it in just the same way. The child's upbringing presents him with a standard: 'this is how you ought to do it.' If he now makes use of this standard in making the comparison, he will easily conclude: 'he did not do it right' and 'I can do it better'. In this case he laughs at the other person, he laughs at him in the feeling of his own superiority. There is nothing to prevent our deriving this laughter too from a difference in expenditure; but on the analogy of the cases of laughing at people that we have come across we may infer that the comic feeling is not present in a child's superior laughter. It is a laughter of pure pleasure. In our own case when we have a clear judgement of our own superiority, we merely smile instead of laughing, or, if we laugh, we can nevertheless distinguish this becoming conscious of our superiority from the comic that makes us laugh.

It is probably right to say that children laugh from pure pleasure in a variety of circumstances that we feel as 'comic' and cannot find the motive for, whereas a child's motives are clear and can be stated. For instance, if someone slips in the street and falls down we laugh because the impression - we do not know why - is comic. A child laughs in the same case from a feeling of superiority or from *Schadenfreude*: 'You've fallen down, I haven't.' Certain motives for pleasure in children seem to be lost to us adults, and instead in the same circumstances we have the 'comic' feeling as a substitute for the lost one.

If one might generalize, it would seem most attractive to place the specific characteristic of the comic which we are in search of in an awakening of the infantile - to regard the comic as the regained 'lost laughter of childhood'. One could then say: 'I laugh at a difference in expenditure between another person and myself, every time I rediscover the child in him.' Or, put more exactly, the complete comparison which leads to the comic would run: 'That is how he does it - I do it in another way - he does it as I used to do it as a child.'

Thus the laughter would always apply to the comparison between the adult's ego and the child's ego. Even the lack of uniformity in the comic difference - the fact that what seems to me comic is sometimes a greater and sometimes a smaller expenditure - would fit in with the infantile determinant; actually what is comic is invariably on the infantile side.

This is not contradicted by the fact that, when children themselves are the object of the comparison, they do not give me a comic impression but a purely pleasurable one; nor is it contradicted because the comparison with the infantile only produces a comic effect if any other use of the difference is avoided. For these are matters concerned with the conditions governing *discharge*. Whatever brings a psychical process into connection with others operates against the discharge of the surplus cathexis and puts it to some other use; whatever isolates a psychical act encourages discharge. A conscious attitude to children as objects of comparison therefore makes impossible the discharge that is necessary for comic pleasure. Only when the cathexis is *preconscious* is there an approximation to an isolation such as, incidentally, we may ascribe to the mental processes in children as well. The addition to the comparison ('I did it like that as a child too') from which the comic effect is derived would thus only come into consideration, as far as differences of medium magnitude are concerned, if no other nexus could gain control over the liberated surplus.

If we pursue our attempt to discover the essence of the comic in a preconscious link with the infantile, we must go a step further than Bergson and admit that a comparison need not, in order to produce the comic, arouse old childish pleasures and childish play; it will be enough for it to touch upon childish nature in general, and perhaps even on childish suffering. Here we shall be parting from Bergson but remaining in agreement with ourselves if we connect comic pleasure not with recollected pleasure but once more with a comparison. It may be that cases of the former kind may coincide with the invariably and irresistibly comic.

Let us at this point review the scheme which we drew up earlier of the various comic possibilities. We remarked that the comic difference was found either

- (a) by a comparison between another person and oneself, or
- (b) by a comparison entirely within the other person, or
- (c) by a comparison entirely within oneself.

In the first of these cases the other person would appear to me as a child; in the second he would reduce himself to a child; and in the third I should discover the child in myself.

The first case would include the comic of movement and form, of mental functioning and of character. The corresponding infantile factors would be the urge to movement and the child's inferior mental and moral development. So that, for instance, a stupid person would be comic to me in so far as he reminded me of a lazy child and a bad person in so far as he reminded me of a naughty child. There could only be a question of a childish pleasure lost to adults in the single instance in which the child's own joy in movement was concerned.

The second case, in which the comic depends entirely on 'empathy', includes the most numerous possibilities - the comic of situation, of exaggeration (caricature), of mimicry, of degradation and of unmasking. This is the case in which the introduction of the infantile point of view proves most useful. For the comic of situation is mostly based on embarrassments, in which we rediscover the child's helplessness. The worst of the embarrassments, the interference by the peremptory demands of natural needs with other functions, corresponds to the child's incomplete control over his bodily functions. Where the comic of situation operates by means of repetitions, it is based on the child's peculiar pleasure in constant repetition (of questions or of being told stories) which make him a nuisance to the adult. Exaggeration, which still gives pleasure to adults in so far as it can find justification with their critical faculty, is connected with the child's peculiar lack of a sense of proportion, his ignorance of all quantitative relations, which he comes to know later than qualitative ones. The use of moderation and restraint, even in the case of permitted impulses, is a late fruit of education and is acquired by the mutual inhibition of mental activities brought together in a combination. Where such combinations are weakened, as in the unconscious of dreams or in the mono-ideism of psychoneuroses, the child's lack of moderation re-emerges.

We found relatively great difficulties in understanding the comic of mimicry so long as we left the infantile factor out of account. But mimicry is the child's best art and the driving motive of most of his games. A child's ambition aims far less at excelling among his equals than at mimicking the grown-ups. The relation of children to adults is also the basis of the comic of degradation, which corresponds to the condescension shown by adults in their attitude to the life of children. There is little that gives children greater pleasure than when a grown-up lets himself down to their level, renounces his oppressive superiority and plays with them as an equal. This relief, which gives the child pure pleasure, becomes in adults, in the form of degradation, a means of making things comic and a source of comic pleasure. As regards unmasking, we know that it goes back to degradation.

We come up against the most difficulties in finding the infantile basis of the third case, the comic of expectation, which no doubt explains why those authorities who have put this case first in their discussion of the comic have found no occasion for taking account of the infantile factor in the comic. The comic of expectation is no doubt the remotest in children; the capacity to grasp it is the latest to appear. In most of the instances which seem comic to an adult a child would probably feel only disappointment. We might, however, take the child's power of blissful expectation and credulity as a basis for understanding how we appear to ourselves comic 'as a child' when we meet with a comic disappointment.

What we have said would seem to suggest a certain probability for a translation of the comic feeling that might run; 'Those things are comic which are not proper for an adult.' Nevertheless I do not feel bold enough, in virtue of my whole attitude to the problem of the comic, to defend this last assertion with as much seriousness as my earlier ones. I am unable to decide whether degradation to being a child is only a special case of comic degradation, or whether everything comic is based fundamentally on degradation to being a child.¹

¹ The fact that comic pleasure has its source in the 'quantitative contrast' of a comparison between small and large, which after all also expresses the essential relation between a child and an adult - this would certainly be a strange coincidence if the comic had no other connection with the infantile.

An enquiry which deals with the comic, however cursorily, would be seriously incomplete if it did not find room for at least a few remarks about *humour*. The essential kinship between the two is so little open to doubt that an attempt at explaining the comic is bound to make at least some contribution to an understanding of humour. However much that is pertinent and impressive may have been brought forward in the appreciation of humour (which, itself one of the highest psychical achievements, enjoys the particular favour of thinkers), yet we cannot evade an attempt at giving expression to its nature by an approach to the formulas for jokes and for the comic.

We have seen that the release of distressing affects is the greatest obstacle to the emergence of the comic. As soon as the aimless movement does damage, or the stupidity leads to mischief, or the disappointment causes pain, the possibility of a comic effect is at an end. This is true, at all events, for a person who cannot ward off such unpleasure, who is himself its victim or is obliged to have a share in it; whereas a person who is not concerned shows by his demeanour that the situation involved contains everything that is required for a comic effect. Now humour is a means of obtaining pleasure in spite of the distressing affects that interfere with it; it acts as a substitute for the generation of these affects, it puts itself in their place. The conditions for its appearance are given if there is a situation in which, according to our usual habits, we should be tempted to release a distressing affect and if motives then operate upon us which suppress that affect *in statu nascendi*. In the cases that have just been mentioned the person who is the victim of the injury, pain, and so on, might obtain *humorous* pleasure, while the unconcerned person laughs from *comic* pleasure. The pleasure of humour, if this is so, comes about - we cannot say otherwise - at the cost of a release of affect that does not occur: it arises from *an economy in the expenditure of affect*.

Humour is the most easily satisfied among the species of the comic. It completes its course within a single person; another person's participation adds nothing new to it. I can keep to myself the enjoyment of the humorous pleasure that has arisen in me, without feeling obliged to communicate it. It is not easy to say what happens in a person when humorous pleasure is generated; but we can obtain some insight if we examine the cases in which humour is communicated or sympathized with, cases in which, by an understanding of the humorous person, we arrive at the same pleasure as his. The crudest case of humour - what is known as *Galgenhumor* - may be instructive in this connection. A rogue who was being led out to execution on a Monday remarked: 'Well, this week's beginning nicely.' This is actually a joke, since the remark is quite apt in itself, but on the other hand, is misplaced in a nonsensical way, since for the man himself there would be no further events that week. But humour is concerned in the *making* of such a joke - that is, in disregarding what it is that distinguishes the beginning of this week from others, in denying the distinction which might give rise to motives for quite special emotions. The case was the same when the rogue on his way to execution asked for a scarf for his bare throat so as not to catch cold - an otherwise laudable precaution but one which, in view of what lay in store so shortly for the neck, was remarkably superfluous and unimportant. It must be confessed that there is something like magnanimity in this *blague*, in the man's tenacious hold upon his customary self and his disregard of what might overthrow that self and drive it to despair. This kind of grandeur of humour appears unmistakably in cases in which our admiration is not inhibited by the circumstances of the humorous person.

In Victor Hugo's *Hernani*, the bandit who has become involved in a conspiracy against his King, Charles I of Spain (the Emperor Charles V), has fallen into the hands of this powerful enemy. He foresees that, convicted of high treason, it is his fate to lose his head. But this fore-knowledge does not prevent his letting himself be known as a Hereditary Grandee of Spain and declaring that he has no intention of renouncing any of the privileges that are his due. A Grandee of Spain might cover his head in the presence of his royal master. Very well, then:

. . . . Nos têtes ont le droit
De tomber couvertes devant de toi.¹

This is humour on the grand scale, and if when we hear it we do not laugh, that is because our admiration covers the humorous pleasure. In the case of the rogue who refuses to catch cold on the way to execution we laugh heartily. The situation that ought to drive the criminal to despair might rouse intense pity in us; but that pity is inhibited because we understand that he, who is more closely concerned, makes nothing of the situation. As a result of this understanding, the expenditure on the pity, which was already prepared, becomes unutilizable and we laugh it off. We are, as it were, infected by the rogue's indifference - though we notice that it has cost him a great expenditure of psychical work.

An economy of pity is one of the most frequent sources of humorous pleasure. Mark Twain's humour usually works with his mechanism. In an account of his brother's life, for instance, he tells us how he was at one time employed on a great road-making enterprise. The premature explosion of a mine blew him up into the air and he came down again far away from the place where he had been working. We are bound to have feelings of sympathy for the victim of the accident and would like to ask whether he was injured by it. But when the story goes on to say that his brother had a half-day's wages deducted for being 'absent from his place of employment' we are entirely distracted from our pity and become almost as hard-hearted as the contractor and almost as indifferent to possible damage to the brother's health. On another occasion Mark Twain presents us with his family tree, which he traces back to one of Columbus's fellow-voyagers. He then describes this ancestor's character and how his baggage consisted entirely of a number of pieces of washing each of which had a different laundry-mark - here we cannot help laughing at the cost of an economy of the feelings of piety into which we were prepared to enter at the beginning of this family history. The mechanism of the humorous pleasure is not interfered with by our knowledge that this pedigree is a fictitious one and that the fiction serves the satirical purpose of exposing the embellishments in similar accounts by other people: it is as independent of the condition that it must be real as in the case of making things comic. In yet another story, Mark Twain describes how his brother constructed a subterranean dwelling, into which he brought a bed, a table and a lamp and which he roofed over with a large piece of sailcloth with a hole in the middle. At night, however, after the hut was finished, a cow that was being driven home fell through the opening of the roof on to the table and put out the lamp. His brother patiently helped to get the beast out and put the establishment to rights again. Next night the same interruption was repeated and his brother behaved as before. And so it was every following night. Repetition makes the story comic, but Mark Twain ends it by reporting that on the forty-sixth night, when the cow fell through again, his brother finally remarked: 'The thing's beginning to get monotonous.' At this our humorous pleasure cannot be kept back, for what we had long expected to hear was that this obstinate set of misfortunes would make his brother *angry*. And indeed the small contributions of humour that we produce ourselves are as a rule made at the cost of anger - instead of getting angry.²

¹ ['Our heads have the right to fall before you covered.']

² The grandiose humorous effect of a figure like that of the fat knight Sir John Falstaff rests on an economy in contempt and indignation. We recognize him as an undeserving gormandizer and swindler, but our condemnation is disarmed by a whole number of factors. We can see that he knows himself as well as we do; he impresses us by his wit, and, besides this, his physical disproportion has the effect of encouraging us to take a comic view of him instead of a serious one, as though the demands of morality and honour must rebound from so fat a stomach. His doings are on the whole harmless, and are almost excused by the comic baseness of the people he cheats. We admit that the poor fellow has a right to try to live and enjoy himself like anyone else, and we almost pity him because in the chief situations we find him a plaything in the hands of someone far his superior. So we cannot feel angry with him and we add all that we economize in indignation with him to the comic pleasure which he affords us apart from this. Sir John's own humour arises in fact from the superiority of an ego which neither his physical nor his moral defects can rob of its cheerfulness and assurance.

The ingenious knight Don Quixote de la Mancha is, on the contrary, a figure who possesses no humour himself but who with his seriousness offers us a pleasure which could be called humorous, though its mechanism shows an important divergence from that of humour. Don Quixote is originally a purely comic figure, a big child; the phantasies from his books of chivalry have gone to his head. It is well known that to begin with the author intended nothing else of him and that his creation gradually grew far beyond its creator's first intentions. But after the author had equipped this

Jokes and Their Relation To The Unconscious

ridiculous figure with the deepest wisdom and the noblest purposes and had made him into the symbolic representative of an idealism which believes in the realization of its aims and takes duties seriously and takes promises literally, this figure ceased to have a comic effect. Just as in other cases humorous pleasure arises from the prevention of an emotion, so it does here from the interference with comic pleasure. But it is clear that these examples have already carried us a long way from the simple cases of humour.

The species of humour are extraordinarily variegated according to the nature of the emotion which is economized in favour of the humour: pity, anger, pain, tenderness, and so on. Their number seems to remain uncompleted because the kingdom of humour is constantly being enlarged whenever an artist or writer succeeds in submitting some hitherto unconquered emotions to the control of humour, in making them, by devices like those in the examples we have given, into sources of humorous pleasure. The artists in *Simplicissimus*, for instance, have had astonishing results in achieving humour at the cost of horror and disgust. The forms in which humour is manifested are, moreover, determined by two peculiarities which are connected with the conditions under which it is generated. Humour may, in the first place, appear merged with a joke or some other species of the comic; in that case its task is to get rid of a possibility implicit in the situation that an affect may be generated which would interfere with the pleasurable outcome. In the second place, it may stop this generating of an affect entirely or only partially; this last is actually the commoner case since it is easier to bring about, and it produces the various forms of 'broken'¹ humour - the humour that smiles through tears. It withdraws a part of its energy from the affect and in exchange gives it a tinge of humour.

The humorous pleasure derived from sympathy originates, as can be seen from the examples above, from a peculiar technique comparable to displacement, by means of which the release of affect that is already in preparation is disappointed and the cathexis diverted on to something else, often on to something of secondary importance. But this does not help us at all to understand the process by which the displacement away from the generating of affect takes place in the humorous person himself. We can see that the receiver imitates the creator of the humour in his mental processes, but this tells us nothing of the forces which make the process possible in the latter.

¹ A term which is used in quite another sense in Vischer's aesthetics.

We can only say that if someone succeeds, for instance, in disregarding a painful affect by reflecting on the greatness of the interests of the world as compared with his own smallness, we do not regard this as an achievement of humour but of philosophical thought, and if we put ourselves into his train of thought, we obtain no yield of pleasure. Humorous displacement is thus just as impossible under the glare of conscious attention as is comic comparison; like the latter, it is tied to the condition of remaining preconscious or automatic.

We can gain some information about humorous displacement if we look at it in the light of a defensive process. Defensive processes are the psychical correlative of the flight reflex and perform the task of preventing the generation of unpleasure from internal sources. In fulfilling this task they serve mental events as an automatic regulation, which in the end, incidentally, turns out to be detrimental and has to be subjected to conscious thinking. I have indicated one particular form of this defence, repression that has failed, as the operative mechanism for the development of psychoneuroses. Humour can be regarded as the highest of these defensive processes. It scorns to withdraw the ideational content bearing the distressing affect from conscious attention as repression does, and thus surmounts the automatism of defence. It brings this about by finding a means of withdrawing the energy from the release of unpleasure that is already in preparation and of transforming it, by discharge, into pleasure. It is even conceivable that once again it may be a connection with the infantile that puts the means for achieving this at its disposal. Only in childhood have there been distressing affects at which the adult would smile to-day - just as he laughs, as a humorist, at his present distressing affects. The exaltation of his ego, to which the humorous displacement bears witness, and of which the translation would no doubt be 'I am too big (too fine) to be distressed by these things', might well be derived from his comparing his present ego with his childish one. This view is to some extent supported by the part played by the infantile in neurotic processes of repression.

On the whole humour is closer to the comic than to jokes. It shares with the former its psychical localization in the preconscious whereas jokes, as we have had to suppose, are formed as a compromise between the unconscious and the preconscious. On the other hand humour does not participate in a peculiar characteristic common to jokes and the comic, on which we have perhaps not yet laid sufficient stress. It is a necessary condition for generating the comic that we should be obliged, *simultaneously or in rapid succession*, to apply to one and the same act of ideation two different ideational methods, between which the 'comparison' is then made and the comic difference emerges. Differences in expenditure of this kind arise between that belongs to someone else and to oneself, between what is as usual and what has been changed, between what is expected and what happens.¹ In the case of jokes, the difference between two simultaneous methods of viewing things, which operate with a different expenditure, applies to the process in the person who hears the joke. One of these two views, following the hints contained in the joke, passes along the path of thought through the unconscious; the other stays on the surface and views the joke like any other wording that has emerged from the preconscious and become conscious. We should perhaps be justified in representing the pleasure from a joke that is heard as being derived from the difference between these two methods of viewing it.² Here we are saying of jokes what we described as their possessing a Janus head, while the relation between jokes and the comic had still to be cleared up.³

¹ If we are prepared to do a little violence to the concept of 'expectation', we can, following Lipps, include a very large region of the comic under the comic of expectation. But what are probably the most basic instances of the comic, those arising from a comparison between someone else's expenditure and one's own, would be the very ones that fitted in least easily to this grouping.

² We can accept this formula without question, since it leads to nothing that would contradict our earlier discussions. The difference between the two expenditures must in essence come down to the inhibitory expenditure that is saved. The lack of this economy in inhibition in the case of the comic, and the absence of quantitative contrast in the case of jokes, would determine the distinction between the comic feeling and the impression of a joke, in spite of their agreeing in the characteristic of using two kinds of ideational activity for the same view.

³ This peculiarity of the '*double face*' [in French in the original] has naturally not escaped the authorities. Mélinand (1895), from whom I have borrowed this phrase, states the determinants of laughter in the following formula: 'Ce qui fait rire c'est ce qui est à la fois, d'un côté, absurde et de l'autre, familier.' ['What makes one laugh is what is on the one hand absurd, and on the other familiar.'] This formula fits jokes better than the comic, but does not completely cover the former either. - Bergson (1900, 98) defines the comic situation by the 'interférence des séries': 'Une situation est toujours comique quand elle appartient en même temps à deux séries d'événements absolument indépendantes, et qu'elle peut s'interpréter à la fois dans deux sens tout différents.' ['A situation is always comic when it belongs at the same time to two series of events that are absolutely independent, and where it can be interpreted simultaneously in two quite different senses.'] - Lipps regards the comic as 'the bigness and smallness of the same thing'.

In the case of humour the characteristic which we have just brought forward becomes effaced. It is true that we feel humorous pleasure when an emotion is avoided which we should have expected because it usually accompanies the situation, and to that extent humour too comes under the extended concept of the comic of expectation. But with humour it is no longer a question of two different methods of viewing the same subject matter. The fact that the situation is dominated by the emotion that is to be avoided, which is of an unpleasurable character, puts an end to the possibility of comparing it with the characteristics of the comic and of jokes. Humorous displacement is in fact a case of a liberated expenditure being used elsewhere - a case which has been shown to be so perilous to a comic effect.

We are now at the end of our task, having reduced the mechanism of humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an economy in expenditure upon inhibition, the pleasure in the comic from an economy in expenditure upon ideation (upon cathexis) and the pleasure in humour from an economy in expenditure upon feeling. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy - the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.

DELUSIONS AND DREAMS IN JENSEN'S *GRADIVA*
(1907)

Intentionally left blank

DELUSIONS AND DREAMS IN JENSEN'S *GRADIVA*

I

A group of men who regarded it as a settled fact that the essential riddles of dreaming have been solved by the efforts of the author of the present work¹ found their curiosity aroused one day by the question of the class of dreams that have never been dreamt at all - dreams created by imaginative writers and ascribed to invented characters in the course of a story. The notion of submitting this class of dreams to an investigation might seem a waste of energy and a strange thing to undertake; but from one point of view it could be considered justifiable. It is far from being generally believed that dreams have a meaning and can be interpreted. Science and the majority of educated people smile if they are set the task of interpreting a dream. Only the common people, who cling to superstitions and who on this point are carrying on the convictions of antiquity, continue to insist that dreams can be interpreted. The author of *The Interpretation of Dreams* has ventured, in the face of the reproaches of strict science, to become a partisan of antiquity and superstition. He is, it is true, far from believing that dreams foretell the future, for the unveiling of which men have vainly striven from time immemorial by every forbidden means. But even he has not been able entirely to reject the relation of dreams to the future. For the dream, when the laborious work of translating it had been accomplished, revealed itself to him as a wish of the dreamer's represented as fulfilled; and who could deny that wishes are predominantly turned towards the future?

I have just said that dreams are fulfilled wishes. Anyone who is not afraid of making his way through an abstruse book, and who does not insist on a complicated problem being represented to him as easy and simple in order to save him trouble and at the cost of honesty and truth, may find the detailed proof of this thesis in the work I have mentioned. Meanwhile, he may set on one side the objections which will undoubtedly occur to him against equating dreams and wish-fulfillments.

¹ See Freud, *The Interpretation of Dreams* (1900a).

But we have gone a long way ahead. It is not a question yet of establishing whether the meaning of a dream can always be rendered by a fulfilled wish, or whether it may not just as often stand for an anxious expectation, an intention, a reflection, and so on. On the contrary, the question that first arises is whether dreams have a meaning at all, whether they ought to be assessed as mental events. Science answers 'no': it explains dreaming as a purely physiological process, behind which, accordingly, there is no need to look for sense, meaning or purpose. Somatic stimuli, so it says, play upon the mental instrument during sleep and thus bring to consciousness now one idea and now another, robbed of all mental content: dreams are comparable only to twitchings, not to expressive movements, of the mind.

Now in this dispute as to the estimation in which dreams should be held, imaginative writers seem to be on the same side as the ancients, as the superstitious public and as the author of *The Interpretation of Dreams*. For when an author makes the characters constructed by his imagination dream, he follows the everyday experience that people's thoughts and feelings are continued in sleep and he aims at nothing else than to depict his heroes' states of mind by their dreams. But creative writers are valuable allies and their evidence is to be prized highly, for they are apt to know a whole host of things between heaven and earth of which our philosophy has not yet let us dream. In their knowledge of the mind they are far in advance of us everyday people, for they draw upon sources which we have not yet opened up for science. If only this support given by writers in favour of dreams having a meaning were less ambiguous! A strictly critical eye might object that writers take their stand neither for nor against particular dreams having a psychical meaning; they are content to show how the sleeping mind twitches under the excitations which have remained active in it as off-shoots of waking life.

But even this sobering thought does not damp our interest in the fashion in which writers make use of dreams. Even if thus enquiry should teach us nothing new about the nature of dreams, it may perhaps enable us from this angle to gain some small insight into the nature of creative writing. Real dreams were already regarded as unrestrained and unregulated structures - and now we are confronted by unfettered imitations of these dreams! There is far less freedom and arbitrariness in mental life, however, than we are inclined to assume - there may even be none at all. What we call chance in the world outside can, as is well known, be resolved into laws. So, too, what we call arbitrariness in the mind rests upon laws, which we are only now beginning dimly to suspect. Let us, then, see what we find!

There are two methods that we might adopt for this inquiry. One would be to enter deeply into a particular case, into the dream-creations of one author in one of his works. The other would be to bring together and contrast all the examples that could be found of the use of dreams in the works of different authors. The second method would seem to be far the more effective and perhaps the only justifiable one, for it frees us at once from the difficulties involved in adopting the artificial concept of 'writers' as a class. On investigation this class falls apart into individual writers of the most various worth - among them some whom we are accustomed to honour as the deepest observers of the human mind. In spite of this, however, these pages will be devoted to an enquiry of the first sort. It happened that in the group of men among whom the notion first arose there was one who recalled that in the work of fiction that had last caught his fancy there were several dreams which had, as it were, looked at him with familiar faces and invited him to attempt to apply to them the method of *The Interpretation of Dreams*. He confessed that the subject-matter of the little work and the scene in which it was laid may no doubt have played the chief part in creating his enjoyment. For the story was set in the frame of Pompeii and dealt with a young archaeologist who had surrendered his interest in life in exchange for an interest in the remains of classical antiquity and who was now brought back to real life by a roundabout path which was strange but perfectly logical. During the treatment of this genuinely poetic material the reader had been stirred by all kinds of thoughts akin to it and in harmony with it. The work was a short tale by Wilhelm Jensen - *Gradiva* - which its author himself described as a 'Pompeian phantasy'.

And now I ought properly to ask all my readers to put aside this little essay and instead to spend some time in acquainting themselves with *Gradiva* (which first appeared in the bookshops in 1903), so that what I refer to in the following pages may be familiar to them. But for the benefit of those who have already read *Gradiva* I will recall the substance of the story in a brief summary; and I shall count upon their memory to restore to it all the charm of which this treatment will deprive it.

A young archaeologist, Norbert Hanold, had discovered in a museum of antiquities in Rome a relief which had so immensely attracted him that he was greatly pleased at obtaining an excellent plaster cast of it which he could hang in his study in a German university town and gaze at with interest. The sculpture represented a fully-grown girl stepping along, with her flowing dress a little pulled up so as to reveal her sandalled feet. One foot rested squarely on the ground; the other, lifted from the ground in the act of following after, touched it only with the tips of the toes, while the sole and heel rose almost perpendicularly. It was probably the unusual and peculiarly charming gait thus presented that attracted the sculptor's notice and that still, after so many centuries, riveted the eyes of its archaeological admirer.

The interest taken by the hero of the story in this relief is the basic psychological fact in the narrative. It was not immediately explicable. 'Dr. Norbert Hanold, Lecturer in Archaeology, did not in fact find in the relief anything calling for special notice from the point of view of his branch of science.' (3.)¹ 'He could not explain to himself what there was in it that had provoked his attention. He only knew that he had been attracted by something and that the effect had continued unchanged ever since.' But his imagination was occupied with the sculpture without ceasing. He found something 'of to-day' about it, as though the artist had had a glimpse in the street and captured it 'from the life'. He gave the girl thus pictured as she stepped along the name of 'Gradiva' - 'the girl who steps along'. He made up a story that she was no doubt the daughter of an aristocratic family, perhaps 'of a patrician aedile, who carried out his office in the service of Ceres', and that she was on her way to the goddess's temple. Then he found it hard to fit her quiet, calm nature into the busy life of a capital city. He convinced himself, rather, that she must be transported to Pompeii, and that somewhere there she was stepping across the curious stepping-stones which have been dug up and which made it possible to cross dry-foot from one side of the street to the other in rainy weather, though allowing carriage-wheels to pass between them as well. Her features struck him as having a *Greek* look and he had no doubt that she was of Hellenic origin. Little by little he brought the whole of his archaeological learning into the service of these and other phantasies relating to the original who had been the model for the relief.

¹ [Plain numbers in brackets are page references to Jensen, *Gradiva*, 1903.]

But now he found himself confronted by an ostensibly scientific problem which called for a solution. It was a question of his arriving at a critical judgement as to 'whether Gradiva's gait as she stepped along had been reproduced by the sculptor in a life-like manner'. He found that he himself was not capable of imitating it, and in his quest for the 'reality' of this gait he was led 'to make observations of his own from the life in order to clear the matter up'. (9.) This, however, forced him into a course of behaviour that was quite foreign to him. 'Hitherto, the female sex had been to him no more than the concept of something made of marble or bronze, and he had never paid the slightest attention to its contemporary representatives.' Social duties had always seemed to him an unavoidable nuisance; he saw and heard young ladies whom he came across in society so little that when he next met them he would pass them by without a sign; and this, of course, made no favourable impression on them. Now, however, the scientific task which he had taken on compelled him, in dry, but more especially in wet, weather, to look eagerly in the street at women's and girls' feet as they came into view - an activity which brought him some angry, and some encouraging, glances from those who came under his observation; 'but he was aware of neither the one nor the other.' (10.) As an outcome of these careful studies he was forced to the conclusion that Gradiva's gait was not discoverable in reality; and this filled him with regret and vexation.

Soon afterwards he had a terrifying dream, in which he found himself in ancient Pompeii on the day of the eruption of Vesuvius and witnessed the city's destruction. 'As he was standing at the edge of the forum beside the Temple of Jupiter, he suddenly saw Gradiva at no great distance from him. Till then he had had no thought of her presence, but now it occurred to him all at once and as though it was something natural that, since she was a Pompeian, she was living in her native town, and, *without his having suspected it, living as his contemporary.*' (12.) Fear of the fate that lay before her provoked him to utter a warning cry, whereupon the figure, as she calmly stepped along, turned her face towards him. But she then proceeded on her way untroubled, till she reached the portico of the temple; there she took her seat on one of the steps and slowly laid her head down on it, while her face grew paler and paler, as though it were turning into marble. When he hurried after her, he found her stretched out on the broad step with a peaceful expression, like someone asleep, till the rain of ashes buried her form.

When he awoke, the confused shouts of the inhabitants of Pompeii calling for help still seemed to echo in his ears, and the dull muttering of the breakers in the agitated sea. But even after his returning reflection recognized the sounds as the awakening signs of noisy life in a great city, he retained his belief for a long time in the reality of what he had dreamt. When at length he had freed himself of the notion that he himself had been present at the destruction of Pompeii almost two thousand years earlier, he was nevertheless left with what seemed a true conviction that *Gradiva* had lived in Pompeii and been buried there with the others in the year 79 A.D. The dream had as its result that now for the first time in his phantasies about *Gradiva* he mourned for her as someone who was lost.

While he was leaning out of the window, absorbed in these thoughts, his attention was caught by a canary warbling its song from a cage in the open window of the house opposite. Suddenly something passed with a start through the mind of the young man, who seems not yet to have fully woken from his dream. He thought he saw in the street a form like his *Gradiva*, and thought he even recognized her characteristic gait. Without thinking, he hurried into the street so as to catch up with her; and it was only the laughter and jeers of the passers-by at his early-morning attire that quickly drove him back into his house. When he was in his room again, the singing of the canary in its cage once more caught his attention and suggested a comparison with himself. He too, so it seemed to him, was like someone sitting in a cage, though it was easier for him to escape from it. As though as a further aftermath of his dream, and perhaps, too, under the influence of the mild air of spring, a resolve took shape in him to make a spring-time journey to Italy. A scientific excuse for it soon presented itself, even though 'the impulse to make this journey had arisen from a feeling he could not name.' (24.)

Let us pause for a moment at this journey, planned for such remarkably uncogent reasons, and take a closer look at our hero's personality and behaviour. He still appears to us as incomprehensible and foolish; we have no idea how his peculiar folly will be linked to human feeling and so arouse our sympathy. It is an author's privilege to be allowed to leave us in such uncertainty. The charm of his language and the ingenuity of his ideas offer us a provisional reward for the reliance we place in him and for the still unearned sympathy which we are ready to feel for his hero. Of this hero we are further told that he was pre-ordained by family tradition to become an archaeologist, that in his later isolation and independence he was wholly absorbed in his studies and had turned completely away from life and its pleasures. Marble and bronze alone were truly alive for him; they alone expressed the purpose and value of human life. But nature, perhaps with benevolent intent, had infused into his blood a corrective of an entirely unscientific sort - an extremely lively imagination, which could show itself not only in his dreams but often in his waking life as well. This division between imagination and intellect destined him to become an artist or a neurotic; he was one of those whose kingdom is not of this world. Thus it was that it could come about that his interest was attached to a relief representing a girl stepping along in a peculiar fashion, that he wove his phantasies around her, imagined a name and origin for her, placed the figure he had created in the setting of the Pompeii that was buried more than eighteen hundred years before, and finally, after a strange anxiety-dream, magnified his phantasy of the existence and death of this girl named Gradiva into a delusion, which gained an influence over his actions. Such products of the imagination would seem to us astonishing and inexplicable if we met them in someone in real life. Since our hero, Norbert Hanold, is a fictitious person, we may perhaps put a timid question to his author, and ask whether his imagination was determined by forces other than its own arbitrary choice.

We had left our hero at the moment when he was apparently being led by the song of a canary to decide on a journey to Italy, the purpose of which was evidently not clear to him. We learn further that he had no fixed plan or goal for his journey. An inner restlessness and dissatisfaction drove him from Rome to Naples and from thence further still. He found himself among the swarm of honeymooners and was forced to notice the loving couples of 'Edwins' and 'Angelinas',¹ but was quite unable to understand their goings-on. He came to the conclusion that of all the follies of mankind 'getting married takes first place, as the greatest and most incomprehensible, and the senseless honeymoon trips to Italy are, in a way, the crowning touch of this idiocy'. (27.) Having been disturbed in his sleep by the proximity of a loving couple in Rome, he hurriedly fled to Naples, only to find other 'Edwins' and 'Angelinas' there. Having gathered from their conversation that the majority of these pairs of birds had no intention of nesting among the ruins of Pompeii, but were flying towards Capri, he determined to do what they did not, and only a few days after his departure found himself 'contrary to his expectation and intentions' in Pompeii.

But without finding there the repose he was in search of. The part which had so far been played by the honeymoon couples, who had troubled his spirits and harassed his thoughts, was now taken over by the house-flies, which he was inclined to regard as the incarnation of all that is absolutely evil and unnecessary. The two sorts of tormenting spirits melted into a unity: some of the pairs of flies reminded him of the honeymooners, and he suspected that they too were addressing each other in their language as 'dearest Edwin' and 'darling Angelina'. Eventually, he could not but realize that 'his dissatisfaction was not caused only by his surroundings but that its source was in part derived from within himself'. (42.) He felt that 'he was discontented because he lacked something, though it was not clear to him what'.

¹ ['August' and 'Grete' in the original. The names recur frequently in the course of the story and it has seemed best to replace them by those conventionally applied to English honeymoon couples of the late Victorian age.]

Next morning he passed through the '*Ingresso*' into Pompeii, and, after getting rid of the guide, strolled aimlessly through the town, without, strangely enough, remembering that only a short time before he had been present in his dream at its burial. When later on, at the 'hot and holy' mid-day hour, which the ancients regarded as the hour of ghosts, the other visitors had taken flight and the heaps of ruins lay before him desolate and bathed in sunlight, he found that he was able to carry himself back into the life that had been buried - but not by the help of science. 'What it taught was a lifeless, archaeological way of looking at things, and what came from its mouth was a dead, philological language. These were of no help to an understanding through the spirit, the feelings, the heart - put it as you please. Whoever had a longing for that must stand here alone, the only living creature, in the hot silence of mid-day, among the relics of the past, and look, but not with bodily eyes, and listen, but not with physical ears. And then . . . the dead wakened and Pompeii began to live once more.' (55.)

While he was thus animating the past with his imagination, he suddenly saw the unmistakable Gradiva of his relief come out of a house and step trippingly over the lava stepping stones to the other side of the street, just as he had seen her do in his dream the other night, when she had lain down as though to sleep, on the steps of the Temple of Apollo. 'And together with his memory something else came into his consciousness for the first time: without being aware himself of the impulse within him, he had come to Italy and had travelled on to Pompeii, without stopping in Rome or Naples, in order to see whether he could find any traces of her. And "traces" literally; for with her peculiar gait she must have left behind an imprint of her toes in the ashes distinct from all the rest.' (58.)

At this point the tension in which the author has hitherto held us grows for a moment into a painful sense of bewilderment. It is not only our hero who has evidently lost his balance; we too have lost our bearings in the face of the apparition of Gradiva, who was first a marble figure and then an imaginary one. Is she a hallucination of our hero, led astray by his delusions? Is she a 'real' ghost? or a living person? Not that we need believe in ghosts when we draw up this list. The author, who has called his story a 'phantasy', has found no occasion so far for informing us whether he intends to leave us in our world, decried for being prosaic and governed by the laws of science, or whether he wishes to transport us into another and imaginary world, in which spirits and ghosts are given reality. As we know from the examples of *Hamlet* and *Macbeth*, we are prepared to follow him there without hesitation. If so, the imaginative archaeologist's delusion would have to be measured by another standard. Indeed, when we consider how improbable it must be that a real person could exist who bore an exact resemblance to the antique sculpture, our list of alternatives shrinks to two: a hallucination or a mid-day ghost. A small detail in the account soon cancels the first possibility. A large lizard was lying motionless, stretched out in the sunshine, but fled at the approach of Gradiva's foot and darted away across the lava paving-stones. So it was no hallucination, but something outside our dreamer's mind. But could the reality of a *rediviva* startle a lizard?

Gradiva disappeared in front of the House of Meleager. We shall not be surprised to hear that Norbert Hanold pursued his delusion that Pompeii had come to life around him at the mid-day hour of ghosts and supposed that Gradiva too had come to life again and had entered the house in which she had lived before the fatal August day in 79 A.D. Ingenious speculations upon the personality of its owner (after whom the house was probably named), and upon Gradiva's relationship to him, shot through his head, and proved that his science was now completely in the service of his imagination. He entered the house, and suddenly found the apparition once more, sitting on some low steps between two yellow columns. 'There was something white stretched out across her knees; he could not clearly discern what it was; it seemed to be a sheet of papyrus . . .'. On the basis of his latest theories of her origin he addressed her in Greek, and waited with trepidation to learn whether, in her phantom presence she possessed the power of speech. Since she made no reply, he addressed her instead in Latin. Then, with a smile on her lips: 'If you want to speak to me', she said, 'you must do it in German.'

What a humiliation for us readers! So the author has been making fun of us, and, with the help, as it were, of a reflection of the Pompeian sunshine, has inveigled us into a delusion on a small scale, so that we may be forced to pass a milder judgement on the poor wretch on whom the mid-day sun was really shining. Now, however, that we have been cured of our brief confusion, we know that Gradiva was a German girl of flesh and blood - a solution which we were inclined to reject as the most improbable one. And now, with a quiet sense of superiority, we may wait to learn what the relation was between the girl and her marble image, and how our young archaeologist arrived at the phantasies which pointed towards her real personality.

But our hero was not torn from his delusion as quickly as we have been, for, as the author tells us, 'though his belief made him happy, he had to take the acceptance of quite a considerable number of mysteries into the bargain'. (140.) Moreover, this delusion probably had internal roots in him of which we know nothing and which do not exist in ourselves. In his case, no doubt, energetic treatment would seem necessary before he could be brought back to reality. Meanwhile all he could do was to fit his delusion into the wonderful experience he had just had. Gradiva, who had perished with the rest in the destruction of Pompeii, could be nothing other than a mid-day ghost who had returned to life for the brief ghostly hour. But why was it that, after hearing her reply delivered in German, he exclaimed 'I knew your voice sounded like that'? Not only we, but the girl herself was bound to ask the question, and Hanold had to admit that he had never heard it, though he had expected to in his dream, when he called to her as she lay down to sleep on the temple steps. He begged her to do the same thing again as she had then; but now she rose, gave him a strange look, and in a few paces disappeared between the columns of the court. A pretty butterfly had shortly before fluttered round her for a while; and he interpreted it as a messenger from Hades reminding the dead girl that she must return, since the mid-day hour of ghosts was at an end. Hanold still had time to call after the girl as she vanished: 'Will you return here to morrow at the mid-day hour?' To us, however, who can now venture upon more sober interpretations, it looks as though the young lady had seen something improper in the remark addressed to her by Hanold and had left him with a sense of having been insulted; for after all she could have known nothing of his dream. May not her sensibility have detected the erotic nature of his request, whose motive in Hanold's eyes lay in its relation to his dream?

After Gradiva's disappearance our hero had a careful look at all the guests congregated for their mid-day meal at the Hotel Diomède and went on to do the same at the Hotel Suisse, and he was then able to feel assured that in neither of the only two hotels known to him in Pompeii was there anyone bearing the remotest resemblance to Gradiva. He would of course have rejected as nonsensical the idea that he might actually meet Gradiva in one of the two inns. And presently the wine pressed from the hot soil of Vesuvius helped to intensify the whirl of feeling in which he spent the day.

For the following day one thing only was fixed: that Hanold must once more be in the House of Meleager at mid-day; and, in expectation of that moment, he made his way into Pompeii by an irregular route - over the ancient city wall. A sprig of asphodel, hung about with its white bell shaped blossoms, seemed to him significant enough, as the flower of the underworld, for him to pluck it and carry it with him. But as he waited, the whole science of archaeology seemed to him the most pointless and indifferent thing in the world, for another interest had taken possession of him: the problem of 'what could be the nature of the bodily apparition of a being like Gradiva, who was at once dead and, even though only at the mid-day hour, alive'. (80.) He was fearful, too, that he might not meet her that day, for perhaps her return could be permitted only at long intervals; and when he perceived her once again between the columns, he thought her apparition was only a trick of his imagination, and in his pain exclaimed: 'Oh! if only you still existed and lived!' This time, however, he had evidently been too critical, for the apparition possessed a voice, which asked him if he was meaning to bring her the white flower, and engaged him, disconcerted once again, in a long conversation.

To his readers, however, to whom Gradiva has already grown of interest as a living person, the author explains that the displeased and repelling look which she had given him the day before had yielded to an expression of searching interest and curiosity. And indeed she now proceeded to question him, asked for an explanation of his remark on the previous day and enquired when it was that he had stood beside her as she lay down to sleep. In this way she learnt of his dream, in which she had perished along with her native city, and then of the marble relief and the posture of the foot which had so much attracted the archaeologist. And now she showed herself ready to demonstrate her gait, and this proved that the only divergence from the original portrait of Gradiva was that her sandals were replaced by light sand-coloured shoes of fine leather - which she explained as being an adaptation to the present day. She was evidently entering into his delusion, the whole compass of which she elicited from him, without ever contradicting it. Only once did she seem to be distracted from the part she was playing, by an emotion of her own; and this was when, with his thoughts on the relief, he declared that he had recognized her at the first glance. Since at this stage of their conversation she still knew nothing about the relief, it was natural for her to misunderstand Hanold's words; but she quickly recovered herself, and it is only to us that some of her remarks sound as though they had a double sense, as though besides their meaning in the context of the delusion they also meant something real and present-day - for instance, when she regretted that he had not succeeded in confirming the Gradiva gait in his experiments in the streets: 'What a pity! perhaps you would not have had to make the long journey here!' (89.) She also learned that he had given her portrait on the relief the name of 'Gradiva', and told him her real name, 'Zoe'. 'The name suits you beautifully, but it sounds to me like a bitter mockery, for Zoe means life.' 'One must bow to the inevitable', was her reply, 'and I have long grown used to being dead.' Promising to be at the same place again at the mid-day hour next day, she bade him farewell after once more asking him for the sprig of asphodel: 'to those who are more fortunate people give roses in the spring; but to me it is right that you should give the flower of forgetfulness.' No doubt melancholy suited some one who had been so long dead and had returned to life again for a few short hours.

We are beginning to understand now, and to feel some hope. If the young lady in whose form Gradiva had come to life again accepted Hanold's delusion so fully, she was probably doing so in order to set him free from it. There was no other way of doing so; to contradict it would have put an end to any such possibility. Even the serious treatment of a real case of illness of the kind could proceed in no other way than to begin by taking up the same ground as the delusional structure and then investigating it as completely as possible. If Zoe was the right person for the job, we shall soon learn, no doubt, how to cure a delusion like our hero's. We should also be glad to know how such delusions arise. It would be a strange coincidence - but, nevertheless, not without an example or parallel - if the treatment of the delusion were to coincide with its investigation and if the explanation of its origin were to be revealed precisely while it was being dissected. We may suspect, of course, that, if so, our case of illness might end up as a 'commonplace' love-story. But the healing power of love against a delusion is not to be despised - and was not our hero's infatuation for his Gradiva sculpture a complete instance of being in love, though of being in love with something past and lifeless?

After Gradiva's disappearance, there was only a distant sound, like the laughing call of a bird flying over the ruined city. The young man, now by himself, picked up a white object that had been left behind by Gradiva: not a sheet of papyrus, but a sketch-book with pencil drawings of various scenes in Pompeii. We should be inclined to regard her having forgotten the book there as a pledge of her return, for it is our belief that no one forgets anything without some secret reason or hidden motive.

The remainder of the day brought Hanold all manner of strange discoveries and confirmations, which he failed to synthesize into a whole. He perceived to-day in the wall of the portico where Gradiva had vanished a narrow gap, which was wide enough, however, to allow someone unusually slim to pass through it. He recognized that Zoe-Gradiva need not have sunk into the earth here - an idea which now seemed to him so unreasonable that he felt ashamed of having once believed in it; she might well have used the gap as a way of reaching her grave. A slight shadow seemed to him to melt away at the end of the Street of the Tombs in front of what is known as the Villa of Diomedes.

In the same whirl of feeling as on the previous day and deep in the same problems, he now strolled round the environs of Pompeii. What, he wondered, might be the bodily nature of Zoe-Gradiva? Would one feel anything if one touched her hand? A strange urge drove him to a determination to put this experiment to the test. Yet an equally strong reluctance held him back even from the very idea.

On a sun-bathed slope he met an elderly gentleman who, from his accoutrements, must be a zoologist or botanist and who seemed to be engaged in a hunt. This individual turned towards him and said: 'Are you interested in *faraglionensis* as well? I should hardly have suspected it, but it seems to be quite probable that it occurs not only on the Faraglioni Islands off Capri, but has established itself on the mainland too. The method prescribed by our colleague Eimer is a really good one; I have made use of it many times already, with excellent results. Please keep quite still . . .' (96.) Here the speaker broke off and placed a snare made of a long blade of grass in front of a crack in the rocks out of which the small iridescent blue head of a lizard was peering. Hanold left the lizard-hunter with a critical feeling that it was scarcely credible what foolish and strange purposes could lead people to make the long journey to Pompeii - without, needless to say, including in his criticism himself and his intention of searching in the ashes of Pompeii for Gradiva's footprints. Moreover, the gentleman's face seemed familiar, as though he had had a glimpse of it in one of the two hotels; his manner of address, too, had been as though he were speaking to an acquaintance.

In the course of his further walk, he arrived by a side road at a house which he had not yet discovered and which turned out to be a third hotel, the 'Albergo del Sole'. The landlord, with nothing else to do, took the opportunity of showing off his house and the excavated treasures it contained to their best advantage. He asserted that he had been present when the pair of young lovers had been found in the neighbourhood of the Forum, who, in the knowledge of their inevitable doom, had awaited death closely embraced in each other's arms. Hanold had heard of this before, and had shrugged his shoulders over it as a fabulous tale invented by some imaginative story-teller; but to-day the landlord's words aroused his belief and this was increased when a metal clasp was produced, covered with a green patina, which was said to have been retrieved from the ashes beside the girl's remains. He purchased this clasp without any further critical doubts, and when, as he left the *albergo*, he saw in an open window a nodding sprig of asphodel covered with white blossoms, the sight of the funeral flowers came over him as a confirmation of the genuineness of his new possession.

But with the clasp a new delusion took possession of him, or rather the old one had a small piece added to it - no very good augury, it would seem, for the treatment that had been begun. A pair of young lovers in an embrace had been dug out not far from the Forum, and it was in that very neighbourhood, by the Temple of Apollo, that in his dream he had seen Gradiva lie down to sleep. Was it not possible that in fact she had gone further along from the Forum and had met someone and that they had then died together? A tormenting feeling, which we might perhaps liken to jealousy, arose out of this suspicion. He appeased it by reflecting on the uncertainty of the construction, and brought himself to his senses far enough to be able to take his evening meal at the Hotel Diomède. There his attention was drawn by two newly-arrived visitors, a He and a She, whom he was obliged to regard as a brother and sister on account of a certain resemblance between them - in spite of the difference in the colour of their hair. They were the first people he had met on his journey who made a sympathetic impression on him. A red Sorrento rose worn by the girl aroused some kind of memory in him, but he could not think what. At last he went to bed and had a dream. It was a remarkably senseless affair, but was obviously hashed up from his day's experiences. 'Somewhere in the sun Gradiva was sitting, making a snare out of a blade of grass to catch a lizard in, and said: "Please keep quite still. Our lady colleague is right; the method is a really good one and she has made use of it with excellent results."' He fended off this dream while he was still asleep, with the critical thought that it was utter madness, and he succeeded in freeing himself from it with the help of an invisible bird which uttered a short laughing call and carried off the lizard in its beak.

In spite of all this turmoil, he woke up in a rather clearer and steadier frame of mind. A branch of a rose-tree bearing flowers of the sort he had seen the day before on the young lady's breast reminded him that during the night someone had said that people give roses in the spring. Without thinking, he picked a few of the roses, and there must have been something connected with them that had a relaxing effect on his mind. He felt relieved of his unsociable feelings, and went by the usual way to Pompeii, burdened with the roses, the metal clasp and the sketch-book, and occupied with a number of problems concerning Gradiva. The old delusion had begun to show cracks: he was beginning to wonder whether she might be in Pompeii, not at the mid-day hour only, but at other times as well. The stress had shifted, however, to the latest addition, and the jealousy attaching to it tormented him in all sorts of disguises. He could almost have wished that the apparition might remain visible to his eyes alone, and elude the perception of others: then, in spite of everything, he could look on her as his own exclusive property. While he was strolling about, waiting for the mid-day hour, he had an unexpected encounter. In the *Casa del Fauno* he came upon two figures in a corner in which they must have thought themselves out of sight, for they were embraced in each other's arms and their lips were pressed together. He was astonished to recognize in them the sympathetic couple from the previous evening. But their behaviour now did not seem to fit a brother and sister: their embrace and their kiss seemed to him to last too long. So after all they were a pair of lovers, presumably a young honeymoon couple - yet another Edwin and Angelina. Curiously enough, however, this time the sight of them caused him only satisfaction; and with a sense of awe, as though he had interrupted some secret act of devotion, he withdrew unobserved. An attitude of respectfulness, which he had long been without, had returned to him.

When he reached the House of Meleager, he was once more overcome by such a violent dread of finding Gradiva in someone else's company that when she appeared the only words he found to greet her with were: 'Are you alone?' It was with difficulty that he allowed her to bring him to realize that he had picked the roses for her. He confessed his latest delusion to her - that she was the girl who had been found in the forum in a lover's embrace and who had owned the green clasp. She enquired, not without a touch of mockery, whether he had found the thing in the sun perhaps: the sun (and she used the [Italian] word '*sole*') produced all kinds of things like that. He admitted that he was feeling dizzy in his head, and she suggested as a cure that he should share her small picnic meal with her. She offered him half of a roll wrapped up in tissue paper and ate the other half herself with an obviously good appetite. At the same time her perfect teeth flashed between her lips and made a slight crunching sound as they bit through the crust. 'I feel as though we had shared a meal like this once before, two thousand years ago', she said; 'can't you remember?' (118.) He could think of no reply, but the improvement in his head brought about by the food, and the many indications she gave of her actual presence, were not without their effect on him. Reason began to rise in him and to throw doubt on the whole delusion of Gradiva's being no more than a mid-day ghost - though no doubt it might be argued on the other hand that she herself had just said that she had shared a meal with him two thousand years ago. As a means of settling the conflict an experiment suggested itself: and this he carried out craftily and with regained courage. Her left hand, with its delicate fingers, was resting on her knees, and one of the house-flies whose impertinence and uselessness had so much roused his indignation alighted on it. Suddenly Hanold's hand was raised in the air and descended with a vigorous slap on the fly and Gradiva's hand.

This bold experiment had two results: first, a joyful conviction that he had without any doubt touched a real, living, warm human hand, but afterwards a reproof that made him jump up in a fright from his seat on the steps. For, from Gradiva's lips, when she had recovered from her astonishment, there rang out these words: 'There's no doubt you're out of your mind, Norbert Hanold!' As everyone knows, the best method of waking a sleeper or a sleep-walker is to call him by his own name. But unluckily there was no chance of observing the effects produced on Norbert Hanold by Gradiva's calling him by his name (which he had told no one in Pompeii). For at this critical moment the sympathetic pair of lovers from the *Casa del Fauno* appeared, and the young lady exclaimed in a tone of joyful surprise: 'Zoe! Are you here too? And on your honeymoon like us? You never wrote me a word about it!' In face of this new evidence of Gradiva's living reality, Hanold took flight.

Nor was Zoe-Gradiva very agreeably surprised by this unexpected visit, which interrupted her in what was apparently an important task. But she quickly pulled herself together and made a fluent reply to the question, in which she explained the situation to her friend - and even more to us - and which enabled her to get rid of the young couple. She congratulated them; but she was not on her honeymoon. 'The young man who's just gone off is labouring, like you, under a remarkable aberration. He seems to think there's a fly buzzing in his head. Well, I expect everyone has some sort of insect there. It's my duty to know something about entomology, so I can help a little in cases like that. My father and I are staying at the Sole. Something got into *his* head too, and the brilliant idea occurred to him besides of bringing me here with him on condition that I amused myself on my own at Pompeii and made no demands of any kind on him. I told myself I should dig out something interesting here even by myself. Of course I hadn't counted on making the find that I have - I mean my luck in meeting you, Gisa.' (124.) But now, she added, she must hurry off, so as to be company for her father at his lunch in the 'Sun'. And she departed, after having introduced herself to us as the daughter of the zoologist and lizard-catcher and after having, by all kinds of ambiguous remarks, admitted her therapeutic intention and other secret designs as well.

The direction she took, however, was not towards the Hotel of the Sun, where her father was waiting for her. But it seemed to her too as though a shadowy form was seeking its grave near the Villa of Diomedes, and was vanishing beneath one of the monuments. And for that reason she directed her steps towards the Street of the Tombs, with her foot lifted almost perpendicularly at each step. It was to this same place that Hanold had fled in his shame and confusion. He wandered ceaselessly up and down in the portico of the garden, engaged in the task of disposing of the remains of his problem by an intellectual effort. One thing had become undeniably clear to him: that he had been totally without sense or reason in believing that he had been associating with a young Pompeian woman who had come to life again in a more or less physical shape. It could not be disputed that this clear insight into his delusion was an essential step forward on his road back to a sound understanding. But, on the other hand, this living woman, with whom other people communicated as though she were as physically real as themselves, was *Gradiva*, and she knew his name; and his scarcely awakened reason was not strong enough to solve this riddle. He was hardly calm enough emotionally, either, to show himself capable of facing so hard a task, for he would have preferred to have been buried along with the rest two thousand years before in the Villa of Diomedes, so as to be quite certain of not meeting Zoe-*Gradiva* again.

Nevertheless, a violent desire to see her again struggled against what was left of the inclination to flight still lingering in him.

As he turned one of the four corners of the colonnade, he suddenly recoiled. On a broken fragment of masonry was sitting one of the girls who had perished here in the Villa of Diomedes. This, however, was a last attempt, quickly rejected, at taking flight into the realm of delusion. No, it was Gradiva, who had evidently come to give him the final portion of her treatment. She quite correctly interpreted his first instinctive movement as an attempt to leave the building, and showed him that it was impossible for him to run away, for a terrific downpour of rain had begun outside. She was ruthless, and began her examination by asking him what he had been trying to do with the fly on her hand. He had not the courage to make use of a particular pronoun,¹ but he did have the courage for something more important - for asking her the decisive question:

'As someone said, I was rather confused in my head, and I must apologize for treating the hand . . . I can't understand how I could be so senseless . . . but I can't understand either how its owner could point out my . . . my unreasonableness to me by my own name.' (134.)

'So your understanding has not got as far as that, Norbert Hanold. But I can't say I'm surprised at it, you've accustomed me to it so long. I needn't have come to Pompeii to discover it again, and you could have confirmed it a good hundred miles nearer home.

'A hundred miles nearer', she explained, as he still failed to understand, 'diagonally across the street from where you live - in the house at the corner. There's a cage in my window with a canary in it.'

These last words, as he heard them, affected him like a distant memory: that must have been the same bird whose song had given him the idea of his journey to Italy.

'My father lives in that house: the Professor of Zoology, Richard Bertgang.'

¹ [The pronoun of the second person singular. The point of some of what follows is necessarily lost in English. In all his remarks to Gradiva hitherto, Hanold had used the second person singular, partly, no doubt, because that would be the classical usage. Now, however, that he was beginning to realize that he was talking to a modern German girl, he felt that the second person singular was far too familiar and affectionate. Gradiva, on the other hand, has used the second person singular throughout in speaking to him.]

So, since she was his neighbour, she knew him by sight and by name. We feel a sense of disillusionment: the solution falls flat and seems unworthy of our expectations.

Norbert Hanold showed that he had not yet regained his independence of thought when he replied: 'So you¹ . . . you are Fräulein Zoe Bertgang? But she looked quite different . . .'

Fräulein Bertgang's answer shows us that all the same there had been other relations between the two of them besides their simply being neighbours. She could argue in favour of the familiar '*du*', which he had used naturally to the mid-day ghost but had drawn back from in speaking to the live girl, but on behalf of which she claimed ancient rights: 'If you find this formal mode of address more suitable, I can use it too. But I find the other comes to my lips more naturally. I don't know if I looked different in the early days when we used to run about together in a friendly way or sometimes, by way of a change, used to bump and thump each other. But if you² had even once looked at me attentively in recent years, it might have dawned on you that I've looked like this for quite a time.'

¹ ['*Sie*', the German pronoun of the third person plural, which is always used in formal speech instead of the '*du*' of the second person singular.]

² [From this point to the middle of her next speech, when, as will be seen, she finally rebels, Zoe makes a valiant attempt to use the formal '*Sie*'.]

So there had been a childhood friendship between them - perhaps a childhood love - which justified the 'du'. This solution, it may be, falls just as flat as the one we first suspected. We are brought to a much deeper level, however, when we realize that this childhood relationship unexpectedly explains a number of details in what had happened in their contemporary contact. Consider, for instance, the slapping of Zoe-Gradiva's hand. Norbert Hanold found a most convincing reason for it in the necessity for reaching an experimental answer to the problem of the apparition's physical reality. But was it not at the same time remarkably like a revival of the impulse for the 'bumping and thumping' whose dominance in their childhood was shown by Zoe's words? And think, again, of how Gradiva asked the archaeologist whether it did not seem to him that they had shared a meal like this two thousand years before. This unintelligible question suddenly seems to have a sense, if we once more replace the historical past by the personal one - childhood -, of which the girl still had lively memories but which the young man appeared to have forgotten. And now the discovery dawns upon us that the young archaeologist's phantasies about his Gradiva may have been an echo of his forgotten childhood memories. If so, they were not capricious products of his imagination, but determined, without his knowing it, by the store of childhood impressions which he had forgotten, but which were still at work in him. It should be possible for us to show the origin of the phantasies in detail, even though we can only guess at them. He imagined, for instance, that Gradiva must be of *Greek* origin and that she was the daughter of a respected personage - a priest of Ceres, perhaps. This seems to fit in pretty well with his knowing that she bore the Greek name of Zoe and that she belonged to the family of a Professor of Zoology. But if Hanold's phantasies were transformed memories, we may expect to find an indication of the source of those phantasies in the information given us by Zoe Bertgang. Let us listen to what she has to say. She has told us of their intimate friendship in their childhood, and we shall now hear of the further course taken by this childhood relationship.

'At that time, as a matter of fact, up to about the age when, I don't know why, people begin to call us "*Backfisch*",¹ I had got accustomed to being remarkably dependent on you and believed I could never in the world find a more agreeable friend. I had no mother or sister or brother, my father found a slow-worm in spirits considerably more interesting than me; and everyone (and I include girls) must have *something* to occupy their thoughts and whatever goes along with them. That was what you were then. But when archaeology took hold of you I discovered - you must forgive me, but really your polite innovation sounds to me *too* ridiculous and, besides, it doesn't fit in with what I want to express - as I was saying, it turned out that you'd² become an unbearable person who (at any rate so far as I was concerned) no longer had any eyes in his head or tongue in his mouth, or any memory, where my memory had stuck, of our friendship when we were children. No doubt that was why I looked different from before. For when from time to time I met you in society - it happened once as recently as last winter - you didn't see me, still less did I hear you say a word. Not that there was any distinction for me in that, for you treated everyone else alike. I was thin air for you, and you - with your tuft of fair hair that I'd rumbled for you often enough in the past - you were as dull, as dried-up, and as tongue-tied as a stuffed cockatoo, and at the same time as grandiose as an - *archeopteryx* - yes, that's right, that's what they call the antediluvian bird-monstrosity they've dug up. Only there was one thing I hadn't suspected: that there was an equally grandiose phantasy lodged in your head of looking on me too, here in Pompeii, as something that had been dug up and come to life again. And when all at once there you were standing in front of me quite unexpectedly, it took me quite a lot of trouble at first to make out what an incredible cobweb your imagination had spun in your brain. After that, it amused me and quite pleased me in spite of its lunacy. For, as I told you, I hadn't suspected it of you.'

¹ [Literally 'fish for frying'. The common German slang term equivalent to 'flapper' or 'teenager'.]

² [From this point onwards she finally reverts to '*du*'.]

Thus she tells us plainly enough what with the years had become of their childhood friendship. In her it grew until she was thoroughly in love, for a girl must have something to which she can give her heart. Fräulein Zoe, the embodiment of cleverness and clarity, makes her own mind quite transparent to us. While it is in any case the general rule for a normally constituted girl to turn her affection towards her father in the first instance, Zoe, who had no one in her family but her father, was especially ready to do so. But her father had nothing left over for her; all his interest was engrossed by the objects of his science. So she was obliged to cast her eyes around upon other people, and became especially attached to her young playmate. When he too ceased to have any eyes for her, her love was not shaken by it but rather increased, for he had become like her father, was, like him, absorbed by science and held apart by it from life and from Zoe. Thus it was made possible for her to remain faithful in her unfaithfulness - to find her father once more in her loved one, to include both of them with the same emotion, or, as we may say, to identify both of them in her feeling. What is our justification for this piece of psychological analysis, which might well seem arbitrary? The author has presented us with it in a single, but highly characteristic, detail. When Zoe described the transformation in her former playmate which had so greatly disturbed her, she abused him by comparing him to an archaeopteryx, the bird-like monstrosity which belongs to the archaeology of zoology. In that way she found a single concrete expression of the identity of the two figures. Her complaint applies with the same word to the man she loved and to her father. The archaeopteryx is, we might say, a compromise idea or an intermediate idea in which her thought about the folly of the man she loved coincided with the analogous thought about her father.

With the young man, things had taken a different turn. Archaeology took hold of him and left him with an interest only in women of marble and bronze. His childhood friendship, instead of being strengthened into a passion, was dissolved, and his memories of it passed into such profound forgetfulness that he did not recognize or notice his early playmate when he met her in society. It is true that when we look further we may doubt whether 'forgetfulness' is the correct psychological description of the fate of these memories in our young archaeologist. There is a kind of forgetting which is distinguished by the difficulty with which the memory is awakened even by a powerful external summons, as though some internal resistance were struggling against its revival. A forgetting of this kind has been given the name of 'repression' in psychopathology; and the case which our author has put before us seems to be an example of this repression. Now we do not know in general whether the forgetting of an impression is linked with the dissolution of its memory-trace in the mind; but we can assert quite definitely of 'repression' that it does not coincide with the dissolution or extinction of the memory. What is repressed cannot, it is true, as a rule make its way into memory without more ado; but it retains a capacity for effective action, and, under the influence of some external event, it may one day bring about psychical consequences which can be regarded as products of a modification of the forgotten memory and as derivatives of it and which remain unintelligible unless we take this view of them. We have already seemed to recognize in Norbert Hanold's phantasies about Gradiva derivatives of his repressed memories of his childhood friendship with Zoe Bertgang. A return like this of what has been repressed is to be expected with particular regularity when a person's erotic feelings are attached to the repressed impressions - when his erotic life has been attacked by repression. In such cases the old Latin saying holds true, though it may have been coined first to apply to expulsion by external influences and not to internal conflicts: 'Naturam expelles furca, tamen usque recurret.'¹ But it does not tell us everything. It only informs us of the *fact* of the return of the piece of nature that has been repressed; it does not describe the highly remarkable *manner* of that return, which is accomplished by what seems like a piece of malicious treachery. It is precisely what was chosen as the instrument of repression - like the '*furca*' of the Latin saying - that becomes the vehicle for the return: in and behind the repressing force, what is repressed proves itself victor in the end. This fact, which has been so little noticed and deserves so much consideration, is illustrated - more impressively than it could be by many examples - in a well known etching by Félicien Rops; and it is illustrated in the typical case of repression in the life of saints and penitents. An ascetic monk has fled, no doubt from the temptations of the world, to the image of the crucified Saviour. And now the cross sinks down like a shadow, and in its place, radiant, there rises instead the image of a voluptuous, naked woman, in the same crucified attitude. Other artists with less psychological insight have, in similar representations of temptation, shown Sin, insolent and triumphant, in some position alongside of the Saviour on the cross. Only Rops has placed Sin in the very place of the Saviour on the cross. He seems to have known that, when what has been repressed returns, it emerges from the repressing force itself.

¹ ['You may drive out Nature with a pitchfork, but she will always return.']

It is worth while pausing in order to convince oneself from pathological cases how sensitive a human mind becomes in states of repression to any approach by what has been repressed, and how even trivial similarities suffice for the repressed to emerge behind the repressing force and take effect by means of it. I once had under medical treatment a young man - he was still almost a boy - who, after he had first unwillingly become acquainted with the processes of sex, had taken flight from every sexual desire that arose in him. For that purpose he made use of various methods of repression-: he intensified his zeal in learning, exaggerated his dependence on his mother, and in general assumed a childish character. I will not here enter into the manner in which his repressed sexuality broke through once more precisely in his relation to his mother; but I will describe a rarer and stranger instance of how another of his bulwarks collapsed on an occasion which could scarcely be regarded as sufficient. Mathematics enjoys the greatest reputation as a diversion from sexuality. This had been the very advice to which Jean Jacques Rousseau was obliged to listen from a lady who was dissatisfied with him: 'Lascia le donne e studia la matematica!'¹ So too our fugitive threw himself with special eagerness into the mathematics and geometry which he was taught at school, till suddenly one day his powers of comprehension were paralysed in the face of some apparently innocent problems. It was possible to establish two of these problems: 'Two bodies come together, one with a speed of . . . etc.' and 'On a cylinder, the diameter of whose surface is m , describe a cone . . . etc.' Other people would certainly not have regarded these as very striking allusions to sexual events; but he felt that he had been betrayed by mathematics as well, and took flight from it too.

¹ ['Give up women and study mathematics!']

If Norbert Hanold were someone in real life who had in this way banished love and his childhood friendship with the help of archaeology, it would have been logical and according to rule that what revived in him the forgotten memory of the girl he had loved in his childhood should be precisely antique sculpture. It would have been his well-deserved fate to fall in love with the marble portrait of Gradiva, behind which, owing to an unexplained similarity, the living Zoe whom he had neglected made her influence felt.

Fräulein Zoe seems herself to have shared our view of the young archaeologist's delusion, for the satisfaction she expressed at the end of her 'frank, detailed and instructive speech of castigation' could scarcely have been based on anything but a recognition that from the very first his interest in Gradiva had related to herself. It was *this* which she had not expected of him, but which, in spite of all its delusional disguise, she saw for what it was. The psychical treatment she had carried out, however, had now accomplished its beneficent effect on him. He felt free, for his delusion had now been replaced by the thing of which it could only have been a distorted and inadequate copy. Nor did he any longer hesitate to remember her and to recognize her as the kind, cheerful, clever playmate who in essentials was not in any way changed. But he found something else very strange-

'You mean', said the girl, 'the fact of someone having to die so as to come alive; but no doubt that must be so for archaeologists.' (141.) Evidently she had not forgiven him yet for the roundabout path by way of archaeology which he had followed from their childhood friendship to the new relation that was forming.

'No, I mean your name . . . Because "Bertgang" means the same as "Gradiva" and describes someone "who steps along brilliantly".'¹ (142.)

We ourselves were unprepared for this. Our hero was beginning to cast off his humility and to play an active part. Evidently he was completely cured of his delusion and had risen above it; and he proved this by himself tearing the last threads of the cobweb of his delusion. This, too, is just how patients behave when one has loosened the compulsion of their delusional thoughts by revealing the repressed material lying behind them. Once they have understood, they themselves bring forward the solutions of the final and most important riddles of their strange condition in a number of ideas that suddenly occur to them. We had already guessed that the Greek origin of the imaginary Gradiva was an obscure result of the Greek name 'Zoe'; but we had not ventured to approach the name 'Gradiva' itself, and had let it pass as the untrammelled creation of Norbert Hanold's imagination. But, to and behold! that very name now turns out to have been a derivative - indeed a translation - of the repressed surname of the girl he had loved in the childhood which he was supposed to have forgotten.

¹ [The German root '*bert*' or '*brecht*' is akin to the English 'bright'; similarly '*gang*' is akin to 'go' (in Scotland 'gang').]

The tracing back of the delusion and its resolution were now complete. What the author now adds is no doubt designed to serve as a harmonious end to his story. We cannot but feel reassured about the future when we hear that the young man, who had earlier been obliged to play the pitiable part of a person in urgent need of treatment, advanced still further on the road to recovery and succeeded in arousing in her some of the feelings under which he himself had suffered before. Thus it was that he made her jealous by mentioning the sympathetic young lady who had previously interrupted their tête-à-tête in the House of Meleager, and by confessing that she had been the first woman for whom he had felt a very great liking. Whereupon Zoe prepared to take a chilly leave of him, remarking that everything had now returned to reason - she herself not least; he could look up Gisa Hartleben (or whatever she was now called) again and give her some scientific assistance over the purpose of her visit to Pompeii; she herself, however, must go back to the Albergo del Sole where her father was expecting her for lunch; perhaps they would meet again some time at a party in Germany or in the moon. But once more he was able to make the troublesome fly an excuse for taking possession first of her cheek and then of her lips, and to set in motion the aggressiveness which is a man's inevitable duty in love making. Once only a shadow seemed to fall on their happiness, when Zoe declared that now she really must go back to her father or he will starve at the Sole. 'Your father? . . . what will happen? . . .' (147.) But the clever girl was able swiftly to quiet his concern. 'Probably nothing will happen. I'm not an indispensable part of his zoological collection. If I had been, perhaps I shouldn't have been so foolish as to give my heart to you.' In the exceptional event, however, of her father taking a different view from hers, there was a safe expedient. Hanold need only cross to Capri, catch a *Lacerta faraglionensis* there (he could practise the technique on her little finger), set the creature free over here, catch it again before the zoologist's eyes, and let him choose between a *faraglionensis* on the mainland and his daughter. The scheme, it is easy to see, was one in which the mockery was tinged with bitterness; it was a warning, as it were, to her fiancé not to keep too closely to the model on which she had chosen him. Here again Norbert Hanold reassures us, by showing by all sorts of apparently small signs the great transformation that had taken place in him. He proposed that he and his Zoe should come for their honeymoon to Italy and Pompeii, just as though he had never been indignant with the honeymooning Edwins and Angelinas. He had completely lost from his memory all his feelings against those happy pairs, who had so unnecessarily travelled more than a hundred miles from their German home. The author is certainly right in bringing forward a loss of memory like this as the most trustworthy sign of a change of attitude. Zoe's reply to the plan for the scene of their honeymoon suggested by 'her childhood friend who had also in a sense been dug out of the ruins again' (150.) was that she did not feel quite alive enough yet to make a geographical decision of that sort.

The delusion had now been conquered by a beautiful reality; but before the two lovers left Pompeii it was still to be honoured once again. When they reached the Herculanean Gate, where, at the entrance to the Via Consolare, the street is crossed by some ancient stepping-stones, Norbert Hanold paused and asked the girl to go ahead of him. She understood him 'and, pulling up her dress a little with her left hand, Zoe Bertgang, Gradiva *rediviva*, walked past, held in his eyes, which seemed to gaze as though in a dream; so, with her quietly tripping gait, she stepped through the sunlight over the stepping-stones to the other side of the street.' With the triumph of love, what was beautiful and precious in the delusion found recognition as well.

In his last simile, however, - of the 'childhood friend who had been dug out of the ruins' - the author has presented us with the key to the symbolism of which the hero's delusion made use in disguising his repressed memory. There is, in fact, no better analogy for repression, by which something in the mind is at once made inaccessible and preserved, than burial of the sort to which Pompeii fell a victim and from which it could emerge once more through the work of spades. Thus it was that the young archaeologist was obliged in his phantasy to transport to Pompeii the original of the relief which reminded him of the object of his youthful love. The author was well justified, indeed, in lingering over the valuable similarity which his delicate sense had perceived between a particular mental process in the individual and an isolated historical event in the history of mankind.

II

But after all, what we really intended to do originally was only to investigate two or three dreams that are to be found here and there in *Gradiva* with the help of certain analytic methods. How has it come about, then, that we have been led into dissecting the whole story and examining the mental processes in the two chief characters? This has not in fact been an unnecessary piece of work; it was an essential preliminary. It is equally the case that when we try to understand the real dreams of a real person we have to concern ourselves intensively with his character and his career, and we must get to know not only his experiences shortly before the dream but also those dating far back into the past. It is even my view that we are still not free to turn to our proper task, but that we must linger a little more over the story itself and carry out some further preliminary work.

My readers will no doubt have been puzzled to notice that so far I have treated Norbert Hanold and Zoe Bertgang, in all their mental manifestations and activities, as though they were real people and not the author's creations, as though the author's mind were an absolutely transparent medium and not a refractive or obscuring one. And my procedure must seem all the more puzzling since the author has expressly renounced the portrayal of reality by calling his story a 'phantasy'. We have found, however, that all his descriptions are so faithfully copied from reality that we should not object if *Gradiva* were described not as a phantasy but as a psychiatric study. Only at two points has the author availed himself of the licence open to him of laying down premisses which do not seem to have their roots in the laws of reality. The first time is where he makes the young archaeologist come upon what is undoubtedly an ancient relief but which so closely resembles a person living long afterwards, not only in the peculiarity of the posture of the foot as it steps along but in every detail of facial structure and bodily attitude, that the young man is able to take the physical appearance of that person to be the sculpture come to life. And the second time is where he makes the young man meet the living woman precisely in Pompeii; for the dead woman had been placed there only by his imagination, and the journey to Pompeii had in fact carried him away from the living woman, whom he had just seen in the street of the town in which he lived. This second provision of the author's, however, involves no violent departure from actual possibility; it merely makes use of chance, which unquestionably plays a part in many human histories; and furthermore he uses it to good purpose, for this chance reflects the fatal truth that has laid it down that flight is precisely an instrument that delivers one over to what one is fleeing from. The first premiss seems to lean more towards phantasy and to spring entirely from the author's arbitrary decision - the premiss on which all that follows depends, the far-reaching resemblance between the sculpture and the live girl, which a more sober choice might have restricted to the single feature of the posture of the foot as it steps along. We might be tempted here to allow the play of our own phantasy to forge a link with reality. The name of 'Bertgang' might point to the fact that the women of that family had already been distinguished in ancient days by the peculiarity of their graceful gait; and we might suppose that the Germanic Bertgangs were descended from a Roman family one member of which was the woman who had led the artist to perpetuate the peculiarity of her gait in the sculpture. Since, however, the different variations of the human form are not independent of one another, and since in fact even among ourselves the ancient types re-appear again and again (as we can see in art collections), it would not be totally impossible that a modern Bertgang might reproduce the shape of her ancient ancestress in all the other features of her bodily structure as well. But it would no doubt be wiser, instead of such speculations, to enquire from the author himself what were the sources from which this part of his creation was derived; we should then have a good prospect of showing once again how what was ostensibly an arbitrary decision rested in fact upon law. But since access to the sources in the author's mind is not open to us, we will leave him with an undiminished right to construct a development that is wholly true to life upon an improbable premiss - a right of which Shakespeare, for instance, availed himself in *King Lear*.

Apart from this, it must be repeated, the author has presented us with a perfectly correct psychiatric study, on which we may measure our understanding of the workings of the mind - a case history and the history of a cure which might have been designed to emphasize certain fundamental theories of medical psychology. It is strange enough that the author should have done this. But how if, on being questioned, he were completely to deny any such purpose? It is so easy to draw analogies and to read meanings into things. Is it not rather we who have slipped into this charming poetic story a secret meaning very far from its author's intentions? Possibly. We shall come back to the question later. For the moment, however, we have tried to save ourselves from making any such tendentious interpretation by giving the story almost entirely in the author's own words. Anyone who compares our reproduction with the actual text of *Gradiva* will have to concede us that much.

Perhaps, too, in most people's eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

And it is really correct - this imaginative picture of the history of a case and its treatment. Now that we have finished telling the story and satisfied our own suspense, we can get a better view of it, and we shall now reproduce it with the technical terminology of our science, and in doing so we shall not feel disconcerted at the necessity for repeating what we have said before.

Norbert Hanold's condition is often spoken of by the author as a 'delusion', and we have no reason to reject that designation. We can state two chief characteristics of a 'delusion', which do not, it is true, describe it exhaustively, but which distinguish it recognizably from other disorders. In the first place it is one of the group of pathological states which do not produce a direct effect upon the body but are manifested only by mental indications. And secondly it is characterized by the fact that in it 'phantasies' have gained the upper hand - that is, have obtained belief and have acquired an influence on action. If we recall Hanold's journey to Pompeii in order to look for Gradiva's peculiarly formed footprints in the ashes, we shall have a fine example of an action under the dominance of a delusion. A psychiatrist would perhaps place Norbert Hanold's delusion in the great group of 'paranoia' and possibly describe it as 'fetishistic erotomania', because the most striking thing about it was his being in love with the piece of sculpture and because in the psychiatrist's view, with its tendency to coarsen everything, the young archaeologist's interest in feet and the postures of feet would be bound to suggest 'fetishism'. Nevertheless all such systems of nomenclature and classification of the different kinds of delusion according to their subject-matter have something precarious and barren about them.¹

Furthermore, since our hero was a person capable of developing a delusion on the basis of such a strange preference, a strict psychiatrist would at once stamp him as a *dégénéré* and would investigate the heredity which had remorselessly driven him to this fate. But here the author does not follow the psychiatrist, and with good reason. He wishes to bring the hero closer to us so as to make 'empathy' easier; the diagnosis of '*dégénéré*', whether it is right or wrong, at once puts the young archaeologist at a distance from us, for we readers are the normal people and the standard of humanity. Nor is the author greatly concerned with the hereditary and constitutional preconditions of the state, but on the other hand he plunges deep into the personal mental make-up which can give rise to such a delusion.

¹ In point of fact, the case of N. H. would have to be described as a *hysterical* delusion, not a paranoic one. The indications of paranoia are absent from it.

In one important respect Norbert Hanold behaved quite differently from an ordinary human being. He took no interest in living women; the science of which he was the servant had taken that interest away from him and displaced it on to women of marble or bronze. This is not to be regarded as a trivial peculiarity; on the contrary, it was the basic precondition of the events to be described. For one day it came about that one particular sculpture of that kind laid claim to the whole of the interest which is ordinarily directed only to a living woman, and with that his delusion was there. We then see unrolled before our eyes the manner in which his delusion is cured through a happy turn of events, and his interest displaced back from the marble to a living woman. The author does not let us follow the influences which led our hero to turn away from women; he only informs us that his attitude was not explained by his innate disposition, which, on the contrary, included some amount of imaginative (and, we might add, erotic) needs. And, as we learn later in the story, he did not avoid other children in his childhood: he had a friendship at that age with a little girl, was her inseparable companion, shared his little meals with her, used to thump her too and let her rumple his hair. It is in attachments such as this, in combinations like this of affection and aggressiveness, that the immature erotism of childhood finds its expression; its consequences only emerge later, but then they are irresistible, and during childhood itself it is as a rule recognized as erotism only by doctors and creative writers. Our own writer shows us clearly that he too is of the same opinion; for he makes his hero suddenly develop a lively interest in women's feet and their way of placing them. This interest was bound to bring him a bad reputation both among scientists and among the women of the town he lived in, a reputation of being a foot-fetishist; but we cannot avoid tracing the interest back to the memory of his childhood playmate. For there can be no doubt that even in her childhood the girl showed the same peculiarity of a graceful gait, with her toes almost perpendicularly raised as she stepped along; and it was because it represented that same gait that an ancient marble relief acquired such great importance for Norbert Hanold. Incidentally we may add that in his derivation of the remarkable phenomenon of fetishism the author is in complete agreement with science. Ever since Binet we have in fact tried to trace fetishism back to erotic impressions in childhood.

The state of permanently turning away from women produces a personal susceptibility, or, as we are accustomed to say, a 'disposition' to the formation of a delusion. The development of the mental disorder sets in at the moment when a chance impression arouses the childhood experiences which have been forgotten and which have traces, at least, of an erotic colouring. 'Arouses', however, is certainly not the right description, if we take into account what follows. We must repeat the author's accurate account in correct psychological technical terms. When Norbert Hanold saw the relief, he did not remember that he had already seen a similar posture of the foot in his childhood friend; he remembered nothing at all, but all the effects brought about by the relief originated from this link that was made with the impression of his childhood. Thus the childhood impression was stirred up, it became active, so that it began to produce effects, but it did not come into consciousness - it remained 'unconscious', to use a term which has to-day become unavoidable in psychopathology. We are anxious that this unconscious shall not be involved in any of the disputes of philosophers and natural philosophers, which have often no more than an etymological importance. For the time being we possess no better name for psychical processes which behave actively but nevertheless do not reach the consciousness of the person concerned, and that is all we mean by our 'unconsciousness'. When some thinkers try to dispute the existence of an unconscious of this kind, on the ground that it is nonsensical, we can only suppose that they have never had to do with the corresponding mental phenomena, that they are under the spell of the regular experience that everything mental that becomes active and intense becomes at the same time conscious as well, and that they have still to learn (what our author knows very well) that there are most certainly mental processes which, in spite of being intense and producing effects, none the less remain apart from consciousness.

We said a little earlier that Norbert Hanold's memories of his childhood relations with Zoe were in a state of 'repression'; and here we have called them 'unconscious' memories. So we must now pay a little attention to the relation between these two technical terms, which, indeed, appear to coincide in their meaning. It is not difficult to make the matter plain. 'Unconscious' is the wider concept; 'repressed' is the narrower one. Everything that is repressed is unconscious; but we cannot assert that everything unconscious is repressed. If when Hanold saw the relief he had remembered his Zoe's gait, what had earlier been an unconscious memory of his would have become simultaneously active and conscious, and this would have shown that it had not earlier been repressed. 'Unconscious' is a purely descriptive term, one that is indefinite in some respects and, as we might say, static. 'Repressed' is a dynamic expression, which takes account of the interplay of mental forces; it implies that there is a force present which is seeking to bring about all kinds of psychical effects, including that of becoming conscious, but that there is also an opposing force which is able to obstruct some of these psychical effects, once more including that of becoming conscious. The mark of something repressed is precisely that in spite of its intensity it is unable to enter consciousness. In Hanold's case, therefore, from the moment of the appearance of the relief onwards, we are concerned with something unconscious that is repressed, or, more briefly with something repressed.

Norbert Hanold's memories of his childhood relations with the girl with the graceful gait were repressed; but this is not yet the correct view of the psychological situation. We remain on the surface so long as we are dealing only with memories and ideas. What is alone of value in mental life is rather the feelings. No mental forces are significant unless they possess the characteristic of arousing feelings. Ideas are only repressed because they are associated with the release of feelings which ought not to occur. It would be more correct to say that repression acts upon feelings, but we can only be aware of these in their association with ideas. So that it was Norbert Hanold's erotic feelings that were repressed; and since his erotism knew and had known no other object than Zoe Bertgang in his childhood, his memories of her were forgotten. The ancient relief aroused the slumbering erotism in him, and made his childhood memories active. On account of a resistance to erotism that was present in him, these memories could only become operative as unconscious ones. What now took place in him was a struggle between the power of erotism and that of the forces that were repressing it; the manifestation of this struggle was a delusion.

Our author has omitted to give the reasons which led to the repression of the erotic life of his hero; for of course Hanold's concern with science was only the instrument which the repression employed. A doctor would have to dig deeper here, but perhaps without hitting upon the reason in this case. But, as we have insisted with admiration, the author has not failed to show us how the arousing of the repressed erotism came precisely from the field of the instruments that served to bring about the repression. It was right that an antique, the marble sculpture of a woman, should have been what tore our archaeologist away from his retreat from love and warned him to pay off the debt to life with which we are burdened from our birth.

The first manifestations of the process that had been set going in Hanold by the relief were phantasies, which played around the figure represented in it. The figure seemed to him to have something 'of to-day' about her, in the best sense of the words, and it was as though the artist had captured her 'from the life' stepping along the street. He gave the girl in the ancient relief the name of 'Gradiva', which he constructed on the model of an epithet of the war-god striding into battle - 'Mars Gradivus'. He endowed her personality with more and more characteristics. She may have been the daughter of a respected personage, of a patrician, perhaps, who was connected with the temple service of a deity. He thought he could trace a Greek origin in her features; and finally he felt compelled to remove her from the busy life of a capital and to transport her to the more peaceful Pompeii, and there he made her step across the lava stepping-stones which made it possible to cross from one side of the street to the other. These products of his phantasy seem arbitrary enough, but at the same time innocently unsuspecting. And, indeed, even when for the first time they gave rise to an incitement to action - when the archaeologist, obsessed by the problem of whether this posture of the feet corresponded to reality, began to make observations from life in order to examine the feet of contemporary women and girls - even this action was screened by conscious scientific motives, as though all his interest in the sculpture of Gradiva had sprung from the soil of his professional concern with archaeology. The women and girls in the street, whom he chose as the subjects of his investigation, must, of course, have taken another, crudely erotic view of his behaviour, and we cannot but think them right. We ourselves can be in no doubt that Hanold was as much in ignorance of the motives of his researches as he was of the origin of his phantasies about Gradiva. These, as we learned later, were echoes of his memories of his youthful love, derivatives of those memories, transformations and distortions of them, after they had failed to make their way into his consciousness in an unmodified form. The ostensibly aesthetic judgement that the sculpture had something 'of to-day' about it took the place of his knowledge that a gait of that kind belonged to a girl whom he knew and who stepped across the street *at the present time*. Behind the impression of the sculpture being 'from the life' and the phantasy of its subject being Greek lay his memory of the name Zoe, which means 'life' in Greek. 'Gradiva', as we learn from our hero himself at the end of the story, after he has been cured of his delusion, is a good translation of the surname 'Bertgang' which means something like 'someone who steps along brilliantly or splendidly'. The details about Gradiva's father originated from Hanold's knowledge that Zoe Bertgang was the daughter of a respected teacher at the University, which can well be translated into classical terms as 'temple-service'. Finally, his phantasy transported her to Pompeii, not 'because her quiet, calm nature seemed to demand it', but because no other or better analogy could be found in his science for his remarkable state, in which he became aware of his memories of his childhood friendship through obscure channels of information. Once he had made his own childhood coincide with the classical past (which it was so easy for him to do), there was a perfect similarity between the burial of Pompeii - the disappearance of the past combined with its preservation - and repression, of which he possessed a knowledge through what might be described as 'endopsychic' perception. In this he was employing the same symbolism that the author makes the girl use consciously towards the conclusion of the story: 'I told myself I should be able to dig out something interesting here even by myself. Of course I hadn't counted on making the find that I have . . .' (124.) And at the very end she replied to Hanold's plan for their honeymoon with a reference to 'her childhood friend who had also in a sense been dug out of the ruins again'. (150.)

Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional instincts attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion - phantasies and actions alike - are in fact the products of compromise between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle - in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise, which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor and guarantee of further developments.

These significant peculiarities - the double motivation of phantasies and decisions, and the construction of conscious pretexts for actions to whose motivation the repressed has made the major contribution - will meet us often, and perhaps more clearly, in the further course of the story. And this is just as it should be, for the author has thus grasped and represented the unfailing chief characteristic of pathological mental processes.

The development of Norbert Hanold's delusion proceeded with a dream which, since it was not occasioned by any new event, seems to have arisen entirely out of his mind, filled as it was by a conflict. But let us pause before we enquire whether, in the construction of his dreams, too, the author meets our expectation that he possesses a deep understanding. Let us ask first what psychiatric science has to say to his hypotheses about the origin of a delusion and what attitude it takes to the part played by repression and the unconscious, to conflict and to the formation of compromises. In short, let us ask whether this imaginative representation of the genesis of a delusion can hold its own before the judgement of science.

And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone¹ - I myself have supported all the views that I have here extracted from Jensen's *Gradiva* and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of *Gradiva*; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.³ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

When, from the year 1893 onwards, I plunged into investigations such as these of the origin of mental disturbances, it would certainly never have occurred to me to look for a confirmation of my findings in imaginative writings. I was thus more than a little surprised to find that the author of *Gradiva*, which was published in 1903, had taken as the basis of its creation the very thing that I believed myself to have freshly discovered from the sources of my medical experience. How was it that the author arrived at the same knowledge as the doctor - or at least behaved as though he possessed the same knowledge?

¹ See Bleuler's important work, *Affektivität, Suggestibilität, Paranoia* and C. G. Jung's *Diagnostische Assoziationsstudien*, both published in Zurich in 1906. - [Added 1912:] To-day, in 1912, I am able to retract what is said above as being no longer true. Since it was written, the 'psycho-analytic movement' started by me has become widely extended, and it is constantly growing.

² See the author's *Sammlung Kleiner Schriften zur Neurosenlehre*, 1906.

³ Cf. 'Fragment of an Analysis of a Case of Hysteria' (1905e).

⁴ Cf. *Studies on Hysteria* (Freud, 1895d, with Breuer).

Norbert Hanold's delusion, as I was saying, was carried a step further by a dream which occurred in the middle of his efforts to discover a gait like *Gradiva's* in the streets of the town where he lived. It is easy to give the content of this dream in brief. The dreamer found himself in Pompeii on the day on which that unhappy city was destroyed, and experienced its horrors without being in danger himself; he suddenly saw *Gradiva* stepping along there, and understood all at once, as though it was something quite natural, that since she was a Pompeian, she was living in her native town, and 'without his having suspected it, living as his contemporary'. He was seized with fear on her account and gave a warning cry, whereupon she turned her face towards him for a moment. But she proceeded on her way without paying any attention to him, lay down on the steps of the Temple of Apollo, and was buried in the rain of ashes after her face had lost its colour, as though it were turning into white marble, until it had become just like a piece of sculpture. As he was waking up, he interpreted the noises of a big city penetrating into his bedroom as the cries for help of the despairing inhabitants of Pompeii and the thunder of the wildly agitated sea. The feeling that what he had dreamt had really happened to him would not leave him for some time after he had awoken, and a conviction that *Gradiva* had lived in Pompeii and had perished there on the fatal day was left over with him by the dream as a fresh starting-point for his delusion.

It is not so easy for us to say what the author intended with this dream and what caused him to link the development of the delusion precisely to a dream. Zealous investigators, it is true, have collected plenty of examples of the way in which mental disturbances are linked to dreams and arise out of dreams.¹ It appears, too, that in the lives of a few eminent men impulses to important actions and decisions have originated from dreams. But these analogies are not of much help to our understanding; so let us keep to our present case, our author's imaginary case of Norbert Hanold the archaeologist. By which end are we to take hold of a dream like this so as to fit it into the whole context, if it is not to remain no more than an unnecessary decoration of the story?

¹ Sante de Sanctis (1899).

I can well imagine that at this point a reader may exclaim: 'The dream is quite easily explained - it is a simple anxiety dream, occasioned by the noises of the city, which were misinterpreted into the destruction of Pompeii by the archaeologist, whose mind was occupied with his Pompeian girl.' In view of the low opinion generally prevailing of the performances of dreams, all that is usually asked from an explanation of one is that some external stimulus shall be found that more or less coincides with a piece of the dream's content. This external stimulus to dreaming would be supplied by the noise which woke the sleeper; and with this, interest in the dream would be exhausted. If only we had some reason for supposing that the town was noisier than usual that morning! If only, for instance, the author had not omitted to tell us that Hanold, against his usual practice, had slept that night with his windows open! What a pity the author did not take the trouble to do that! And if only anxiety-dreams were as simple as that! But no, interest in the dream is not so easily exhausted.

There is nothing essential for the construction of a dream in a link with an external sensory stimulus. A sleeper can disregard a stimulus of this kind from the external world, or he can allow himself to be awakened by it without constructing a dream, or, as happened here, he can weave it into his dream if that suits him for some other reason; and there are numerous dreams of which it is impossible to show that their content was determined in this way by a stimulus impinging on the sleeper's senses. No, we must try another path.

We may perhaps find a starting-point in the after-effects left by the dream in Hanold's waking life. Up to then he had had a phantasy that *Gradiva* had been a Pompeian. This hypothesis now became a certainty for him, and a second certainty followed - that she was buried along with the rest in the year 79 A.D.¹ Melancholy feelings accompanied this extension of the delusional structure, like an echo of the anxiety which had filled the dream. This fresh pain about *Gradiva* does not seem very intelligible to us; *Gradiva* would have been dead for many centuries even if she had been saved from destruction in the year 79 A.D. Or ought we not to argue in this kind of way either with Norbert Hanold or with the author himself? Here again there seems no path to an understanding. Nevertheless it is worth remarking that the increment which the delusion acquired from this dream was accompanied by a feeling with a highly painful colouring.

¹ See the text of *Gradiva* (15).

Apart from that, however, we are as much at a loss as before. This dream is not self-explanatory, and we must resolve to borrow from my *Interpretation of Dreams* and apply to the present example a few of the rules to be found in it for the solution of dreams.

One of these rules is to the effect that a dream is invariably related to the events of the day before the dream. Our author seems to be wishing to show that he has followed this rule, for he attaches the dream immediately to Hanold's 'pedestrian researches'. Now these had no meaning other than a search for Gradiva, whose characteristic gait he was trying to recognize. So the dream ought to have contained an indication of where Gradiva was to be found. And it does so, by showing her in Pompeii; but that is no novelty to us.

Another rule tells us that, if a belief in the reality of the dream-images persists unusually long, so that one cannot tear oneself out of the dream, this is not a mistaken judgement provoked by the vividness of the dream-images, but is a psychical act on its own: it is an assurance, relating to the content of the dream, that something in it is really as one has dreamt it; and it is right to have faith in this assurance. If we keep to these two rules, we must conclude that the dream gave some information as to the whereabouts of the Gradiva he was in search of, and that that information tallied with the real state of things. We know Hanold's dream: does the application of these two rules to it yield any reasonable sense?

Strange to say, it does. The sense is merely disguised in a particular way so that it is not immediately recognizable. Hanold learned in the dream that the girl he was looking for was living in a town and contemporaneously with him. Now this was true of Zoe Bertgang; only in the dream the town was not the German university town but Pompeii, and the time was not the present but the year 79 A.D. It is, as it were, a distortion by displacement: what we have is not Gradiva in the present but the dreamer transported into the past. Nevertheless, in this manner, the essential and new fact is stated: *he is in the same place and time as the girl he is looking for*. But whence come this displacement and disguise which were bound to deceive both us and the dreamer over the true meaning and content of the dream? Well, we already have the means at our disposal for giving a satisfactory answer to that question.

Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors of delusions. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship. When this compromise has been accomplished, the memories have turned into the phantasies, which can easily be misunderstood by the conscious personality - that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream-images are what might be described as the creations of people's physiological delusions - the products of the compromise in the struggle between what is repressed and what is dominant which is probably present in every human being, including those who in the day-time are perfectly sound in mind. We shall then understand that dream-images have to be regarded as something distorted, behind which something else must be looked for, something *not* distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the *manifest content of the dream* from what constituted the basis of the dream before the distortion imposed by the censorship - namely, the *latent dream-thoughts*. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream-thoughts, in undoing the distortion which the dream-thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream-thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.

It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

Are we perhaps under an obligation to replace in this way each separate piece of the manifest content of the dream by unconscious thoughts? Strictly speaking, yes; if we were interpreting a dream that had really been dreamt, we could not avoid that duty. But in that case, too, the dreamer would have to give us the most copious explanations. Clearly, we cannot carry out this requirement in the case of the author's creation; nevertheless, we shall not overlook the fact that we have not yet submitted the main content of the dream to the process of interpretation or translation.

For Hanold's dream was an anxiety-dream. Its content was frightening, the dreamer felt anxiety while he slept and he was left with painful feelings afterwards. Now this is far from convenient for our attempt at an explanation; and we must once again borrow heavily from the theory of dream-interpretation. We are warned by that theory not to fall into the error of tracing the anxiety that may be felt in a dream to the content of the dream, and not to treat the content of the dream as though it were the content of an idea occurring in waking life. It points out to us how often we dream the most ghastly things without feeling a trace of anxiety. The true situation, we learn, is quite a different one, which cannot be easily guessed, but which can be proved with certainty. The anxiety in anxiety-dreams, like neurotic anxiety in general, corresponds to a sexual affect, a libidinal feeling, and arises out of libido by the process of repression.¹ When we interpret a dream, therefore, we must replace anxiety by sexual excitement. The anxiety that originates in this way has - not invariably, but frequently - a selective influence on the content of the dream and introduces into it ideational elements which seem, when the dream is looked at from a conscious and mistaken point of view, to be appropriate to the affect of anxiety. As I have said, this is not invariably so, for there are plenty of anxiety-dreams in which the content is not in the least frightening and where it is therefore impossible to give an explanation on conscious lines of the anxiety that is felt.

¹ Cf. my first paper on the anxiety neurosis (1895*b*) and *The Interpretation of Dreams*.

I am aware that this explanation of anxiety in dreams sounds very strange and is not easy to credit; but I can only advise the reader to come to terms with it. Moreover it would be a very remarkable thing if Norbert Hanold's dream could be reconciled with this view of anxiety and could be explained in that way. On that basis, we should say that the dreamer's erotic longings were stirred up during the night and made a powerful effort to make conscious his memory of the girl he loved and so to tear him out of his delusion, but that those longings met with a fresh repudiation and were transformed into anxiety, which in its turn introduced into the content of the dream the terrifying pictures from the memories of his schooldays. In this manner the true unconscious content of the dream, his passionate longing for the Zoe he had once known, became transformed into its manifest content of the destruction of Pompeii and the loss of Gradiva.

So far, I think, it sounds plausible. But it might justly be insisted that, if erotic wishes constitute the undistorted content of the dream, it ought also to be possible to point at least to some recognizable residue of those wishes concealed somewhere in the transformed dream. Well, even that may be possible, with the help of a hint from a later part of the story. When Hanold had his first meeting with the supposed Gradiva, he recollected the dream and begged the apparition to lie down again as he had seen her do then.¹ Thereupon, however, the young lady rose indignantly and left her strange companion, for she had detected the improper erotic wish behind what he had said under the domination of his delusion. We must, I think, accept Gradiva's interpretation; even in a real dream we cannot always expect to find a more definite expression of an erotic wish.

¹ 'No, I didn't hear you speak. But I called to you when you lay down to sleep, and I stood beside you then - your face was as peaceful and beautiful as marble. May I beg of you - lie down once more on the step as you did then.' (70.)

The application of a few of the rules of dream-interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and delusions arise from the same source - from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind - except that, as a rule, with the re-establishment of the psychical cathexes of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.

III

In the further course of the story there is yet another dream, which may perhaps tempt us even more than the first to try to translate it and insert it into the train of events in the hero's mind. But we should save very little by diverging from the author's account and hurrying on immediately to this second dream; for no one who wishes to analyse some one else's dream can avoid turning his attention in the greatest detail to all the dreamer's experiences, both external and internal. It will probably be best, therefore, to keep close to the thread of the story and to intersperse it with our glosses as we proceed.

The construction of the fresh delusion about Gradiva's death during the destruction of Pompeii in the year 79 A.D. was not the only result of the first dream, which we have already analysed. Immediately after it Hanold decided on his journey to Italy, which eventually brought him to Pompeii. But, before that, something else happened to him. As he was leaning out of the window, he thought he saw a figure in the street with the bearing and gait of his Gradiva. In spite of being insufficiently dressed, he hurried after her, but failed to overtake her, and was driven back into the house by the jeers of the passers-by. When he was in his room once more, the song of a canary from its cage in the window of a house opposite stirred up in him a mood in which he too seemed to be a prisoner longing for freedom; and his spring-time journey was no sooner decided on than it was carried out.

The author has thrown a particularly clear light on this journey of Hanold's and has allotted him to have a partial insight into his own internal processes. Hanold of course found himself a scientific pretext for his journey, but this did not last long. After all, he was in fact aware that 'the impulse to make this journey had arisen from a feeling he could not name'. A strange restlessness made him dissatisfied with everything he came across, and drove him from Rome to Naples and from there to Pompeii; but even at this last halting-place he was still uneasy in his mood. He was annoyed at the folly of the honeymooners, and enraged at the impertinence of the house-flies which inhabit Pompeii's hotels. But at last he could no longer disguise from himself 'that his dissatisfaction could not be caused solely by what was around him but that there was something that sprang from himself as well'. He thought he was over-excited, felt 'that he was discontented because he lacked something, but he had no idea what. And this ill-humour followed him about everywhere.' In this frame of mind he was even furious with his mistress - with Science. When in the heat of the mid-day sun he wandered for the first time through Pompeii, 'the whole of his science had not merely abandoned him, but had left him without the slightest desire to find her again. He remembered her only as something in the far distance, and he felt that she had been an old, dried-up, tedious aunt, the dullest and most unwanted creature in the world.' (55.)

And then, while he was in this disagreeable and confused state of feeling, one of the problems attaching to his journey was solved for him - at the moment when he first saw Gradiva stepping through Pompeii. Something 'came into his consciousness for the first time: without being aware himself of the impulse within him, he had come to Italy and had travelled on to Pompeii, without stopping in Rome or Naples, in order to see whether he could find any traces of her. And "traces" literally; for with her peculiar gait she must have left behind an imprint of her toes in the ashes distinct from all the rest.' (58.)

Since the author has taken so much trouble over describing the journey, it must be worth while too to discuss its relation to Hanold's delusion and its position in the chain of events. The journey was undertaken for reasons which its subject did not recognize at first and only admitted to himself later on, reasons which the author describes in so many words as 'unconscious'. This is certainly taken from the life. One does not need to be suffering from a delusion in order to behave like this. On the contrary, it is an event of daily occurrence for a person - even a healthy person - to deceive himself over the motives for an action and to become conscious of them only after the event, provided only that a conflict between several currents of feeling furnishes the necessary condition for such a confusion. Accordingly, Hanold's journey was from the first calculated to serve the delusion, and was intended to take him to Pompeii, where he could proceed further with his search for Gradiva. It will be recalled that his mind was occupied with that search both before and immediately after the dream, and that the dream itself was simply an answer to the question of Gradiva's whereabouts, though an answer which was stifled by his consciousness. Some power which we do not recognize was, however, also inhibiting him to begin with from becoming aware of his delusional intention; so that, for the conscious reasons for his journey, he was left only with insufficient pretexts which had to be renewed from place to place. The author presents us with a further puzzle by making the dream, the discovery of the supposed Gradiva in the street, and the decision to undertake the journey as a result of the singing canary succeed one another as a series of chance events without any internal connection with one another.

This obscure region of the story is made intelligible to us by some explanations which we derive from the later remarks of Zoe Bertgang. It was in fact the original of *Gradiva*, Fräulein Zoe herself, whom Hanold saw out of his window walking past in the street (89.) and whom he nearly overtook. If this had happened, the information given him by the dream - that she was in fact living at the same time and in the same town as he was - would by a lucky chance have received an irresistible confirmation, which would have brought about the collapse of his internal struggle. But the canary, whose singing sent Hanold off on his distant journey, belonged to Zoe, and its cage stood in her window diagonally across the street from Hanold's house. (135.) Hanold, who, according to the girl's accusation, had the gift of 'negative hallucination', who possessed the art of not seeing and not recognizing people who were actually present, must from the first have had an unconscious knowledge of what we only learned later. The indications of Zoe's proximity (her appearance in the street and her bird's singing so near his window) intensified the effect of the dream, and in this position, so perilous for his resistance to his erotic feelings, he took to flight. His journey was a result of his resistance gathering new strength after the surge forward of his erotic desires in the dream; it was an attempt at flight from the physical presence of the girl he loved. In a practical sense it meant a victory for repression, just as his earlier activity, his 'pedestrian researches' upon women and girls, had meant a victory for erotism. But everywhere in these oscillations in the struggle the compromise character of the outcome was preserved: the journey to Pompeii, which was supposed to lead him away from the living Zoe, led him at least to her surrogate, to *Gradiva*. The journey which was undertaken in defiance of the latent dream-thoughts, was nevertheless following the path to Pompeii that was pointed out by the manifest content of the dream. Thus at every fresh struggle between erotism and resistance we find the delusion triumphant.

This view of Hanold's journey as a flight from his awakening erotic longing for the girl whom he loved and who was so close to him is the only one which will fit in with the description of his emotional states during his stay in Italy. The repudiation of erotism which dominated him was expressed there in his disgust at the honeymooners. A short dream which he had in his *albergo* in Rome, and which was occasioned by the proximity of a German loving couple, 'Edwin and Angelina', whose evening conversation he could not help hearing through the thin partition-wall, throws a retrospective light, as it were, on the erotic drift of his first major dream. In the new dream he was once again in Pompeii and Vesuvius was once again erupting, and it was thus linked to the earlier dream whose effects persisted during the journey. This time, however, among the people imperilled were - not, as on the former occasion, himself and Gradiva but - the Apollo Belvedere and the Capitoline Venus, no doubt by way of an ironical exaltation of the couple in the next room. Apollo lifted Venus up, carried her out, and laid her down on some object in the dark which seemed to be a carriage or cart, since it emitted 'a creaking noise'. Apart from this, the interpretation of the dream calls for no special skill. (31.)

Our author, who, as we have long since realized, never introduces a single idle or unintentional feature into history, has given us another piece of evidence of the asexual current which dominated Hanold during his journey. As he roamed about for hours in Pompeii, 'strangely enough it never once recurred to his memory that a short time before he had dreamt of being present at the burial of Pompeii in the eruption of 79 A.D.' (47.) It was only when he caught sight of Gradiva that he suddenly remembered the dream and became conscious at the same time of the delusional reason for his puzzling journey. How could this forgetting of the dream, this barrier of repression between the dream and his mental state during the journey, be explained, except by supposing that the journey was undertaken not at the direct inspiration of the dream but as a revolt against it, as an emanation of a mental power that refused to know anything of the secret meaning of the dream?

But on the other hand Hanold did not enjoy this victory over his erotism. The suppressed mental impulse remained powerful enough to revenge itself on the suppressing one with discontent and inhibition. His longings turned into restlessness and dissatisfaction, which made his journey seem pointless to him. His insight into his reasons for the journey at the bidding of the delusion was inhibited and his relations with his science, which in such a spot should have stirred all his interest, were interfered with. So the author shows us his hero after his flight from love in a kind of crisis, in a state of complete confusion and distraction, in a turmoil such as we usually find at the climax of an illness, when neither of the two conflicting powers has any longer a sufficiently superior strength over the other for the margin between them to make it possible to establish a vigorous mental régime. But here the author intervenes helpfully, and smoothes things out by making Gradiva appear at this juncture and undertake the cure of the delusion. By the power he possesses of guiding the people of his creation towards a happy destiny, in spite of all the laws of necessity which he makes them obey, he arranges that the girl, to avoid whom Hanold had fled to Pompeii, shall be transported to that very place. In this way he corrects the folly to which the young man was led by his delusion - the folly of exchanging the home of the living girl whom he loved for the burial-place of her imaginary substitute.

With the appearance of Zoe Bertgang as Gradiva, which marks the climax of tension in the story, our interest, too, soon takes a new direction. So far we have been assisting at the development of a delusion; now we are to witness its cure. And we may ask whether the author has given a purely fanciful account of the course of this cure or whether he has constructed it in accordance with possibilities actually present. Zoe's own words during her conversation with her newly-married friend give us a definite right to ascribe to her an intention to bring about the cure. (124.) But how did she set about it? When she had got over the indignation aroused in her by his suggestion that she should lie down to sleep again as she had 'then', she returned next day at the same mid-day hour to the same spot, and proceeded to entice out of Hanold all the secret knowledge her ignorance of which had prevented her from understanding his behaviour the day before. She learnt about his dream, about the sculpture of Gradiva, and about the peculiarity of gait which she herself shared with it. She accepted the role of the ghost awakened to life for a brief hour, a role for which, as she perceived, his delusion had cast her, and, by accepting the flowers of the dead which he had brought without conscious purpose, and by expressing a regret that he had not given her roses, she gently hinted in ambiguous words at the possibility of his taking up a new position. (90.)

This unusually clever girl, then, was determined to win her childhood's friend for her husband, after she had recognized that the young man's love for her was the motive force behind the delusion. Our interest in her behaviour, however, will probably yield for the moment to the surprise which we may feel at the delusion itself. The last form taken by it was that Gradiva, who had been buried in 79 A.D., was now able, as a mid-day ghost, to exchange words with him for an hour, at the end of which she must sink into the ground or seek her grave once more. This mental cobweb, which was not brushed away either by his perceiving that the apparition was wearing modern shoes or by her ignorance of the ancient languages and her command of German, which was not in existence in her day, certainly seems to justify the author's description of his story as a 'Pompeian phantasy', but it seems also to exclude any possibility of measuring it by the standards of clinical reality.

Nevertheless, on closer consideration this delusion of Hanold's seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premiss that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premiss on to its consequence - that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover the author has adduced contributory and mitigating circumstances on behalf of his hero's excesses in the shape of the glare of the *campagna* sunlight and the intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: 'I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.' It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves' disease, and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting-room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: 'So after all it's true that the dead can come back to life.' His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

After his first meeting with Gradiva, Norbert Hanold had drunk his wine first in one and then in the other of the two restaurants that he knew in Pompeii, while the other visitors were engaged in eating the main meal of the day. 'Of course it never came into his head to think of the nonsensical idea' that he was doing it in order to discover in which of the hotels Gradiva was living and taking her meals. But it is difficult to say what other sense his actions could have had. On the day after their second meeting in the House of Meleager, he had all kinds of strange and apparently unconnected experiences. He found a narrow gap in the wall of the portico, at the point where Gradiva had disappeared. He met a foolish lizard-catcher who addressed him as though he were an acquaintance. He discovered a third hotel, in an out-of-the-way situation, the 'Albergo del Sole', whose proprietor palmed off on him a metal clasp with a green patina as a find from beside the remains of a Pompeian girl. And, lastly, in his own hotel he noticed a newly-arrived young couple whom he diagnosed as a brother and sister and whom he found sympathetic. All these impressions were afterwards woven together into a 'remarkably senseless' dream, which ran as follows:

'Somewhere in the sun Gradiva was sitting, making a snare out of a blade of grass to catch a lizard in, and said: "Please keep quite still. Our lady colleague is right; the method is a really good one and she has made use of it with excellent results."

He fended off this dream while he was still asleep, with the critical thought that it was utter madness, and cast around in all directions to get free from it. He succeeded in doing so with the help of an invisible bird, which uttered a short laughing call and carried off the lizard in its beak.

Are we to venture on an attempt at interpreting this dream too - that is, at replacing it by the latent thoughts from whose distortion it must have arisen? It is as senseless as only a dream can be expected to be; and this absurdity of dreams is the mainstay of the view which refuses to characterize dreams as completely valid psychical acts and maintains that they arise out of a purposeless excitation of the elements of the mind.

We are able to apply to this dream the technique which may be described as the regular procedure for interpreting dreams. It consists in paying no attention to the apparent connections in the manifest dream but in fixing our eyes upon each portion of its content independently, and in looking for its origin in the dreamer's impressions, memories, and free associations. Since, however, we cannot question Hanold, we shall have to content ourselves with referring to his impressions, and we may very tentatively put our own association in place of his.

'Somewhere in the sun Gradiva was sitting, catching lizards and speaking.' What impression of the previous day finds an echo in this part of the dream? Undoubtedly the encounter with the elderly gentleman, the lizard-catcher, who was thus replaced in the dream by Gradiva. He sat or lay 'on a sun-bathed slope' and he, too, spoke to Hanold. Furthermore, Gradiva's remarks in the dream were copied from this man's remarks: viz. 'The method prescribed by our colleague Eimer is a really good one; I have made use of it many times already with excellent results. Please keep quite still.' Gradiva used much the same words in the dream, except that 'our colleague Eimer' was replaced by an unnamed 'lady colleague'; moreover, the 'many times' in the zoologist's speech was omitted in the dream and the order of the sentences was somewhat altered. It seems, therefore, that this experience of the previous day was transformed into the dream with the help of a few changes and distortions. Why this particular experience? And what is the meaning of the changes - the replacement of the elderly gentleman by Gradiva and the introduction of the enigmatic 'lady colleague'?

There is a rule in interpreting dreams which runs as follows: 'A speech heard in a dream is always derived from one that has been heard or made by the dreamer in waking life.' This rule seems to have been observed here: *Gradiva's* speech is only a modification of the old zoologist's speech which Hanold had heard the day before. Another rule in dream-interpretation would tell us that when one person is replaced by another or when two people are mixed up together (for instance, by one of them being shown in a situation that is characteristic of the other), it means that the two people are being equated, that there is a similarity between them. If we venture to apply this rule too to our dream, we should arrive at this translation: '*Gradiva* catches lizards just like the old man; she is skilled in lizard-catching just as he is.' This result cannot exactly be said to be intelligible as yet; but we have yet another puzzle to solve. To what impression of the previous day are we to relate the 'lady colleague' who in the dream replaces the famous zoologist Eimer? Fortunately we have very little choice here. A 'lady colleague' can only mean another girl - that is to say, represents/represented the sympathetic young lady whom Hanold had taken for a sister travelling with her brother. 'She was wearing a red Sorrento rose in her dress, the sight of which reminded him of something as he looked across from his corner of the dining-room, but he could not think what.' This remark of the author's gives us a right to regard her as the 'lady colleague' in the dream. What Hanold could not recall were, it cannot be doubted, the words spoken by the supposed *Gradiva*, who had told him, as she asked him for the white flowers of the dead, that in the spring people give happier girls roses. But behind those words there had lain a hint of wooing. So what sort of lizard-catching was it that the happier 'lady colleague' had carried out so successfully?

Next day Hanold came upon the supposed brother and sister in an affectionate embrace, and was thus able to correct his earlier mistake. They were in fact a pair of lovers, and moreover on their honeymoon, as we discovered later when they so unexpectedly interrupted Hanold's third interview with Zoe. If now we are willing to assume that Hanold, though consciously taking them for a brother and sister, had immediately recognized their true relationship (which was unambiguously betrayed next day) in his unconscious, Gradiva's speech in the dream acquires a clear meaning. The red rose had become the symbol of a love-relation. Hanold understood that the couple were already what he and Gradiva had yet to become; the lizard-catching had come to signify man-catching; and Gradiva's speech meant something like: 'Only let me alone: I know how to win a man just as well as the other girl does.'

But why was it necessary for this penetration of Zoe's intentions to appear in the dream in the form of the old zoologist's speech? the old gentleman's skill in lizard-catching? Well, we can have no difficulty in answering that question. We guessed long ago that the lizard-catcher was none other than Bertgang, the professor of Zoology and Zoe's father, who, incidentally, must have known Hanold too - which explains how he came to address him as an acquaintance. Let us assume, once again, that in his unconscious Hanold at once recognized the Professor. 'He had a vague notion that he had already had a passing glimpse of the lizard hunter's face, probably in one of the two hotels.' This, then, is the explanation of the strange disguise under which the intention attributed to Zoe made its appearance: she was the lizard-catcher's daughter and had acquired her skill from him.

The replacement of the lizard-catcher by Gradiva in the content of the dream is accordingly a representation of the relation between the two figures which was known to Hanold in his unconscious; the introduction of the 'lady colleague' instead of 'our colleague Eimer' allowed the dream to express Hanold's realization that she was wooing a man. So far the dream welded together ('condensed', as we say) two experiences of the previous day into one situation, in order to bring to expression (in a very obscure way, it is true) two discoveries which were not allotted to become conscious. But we can go further, we can diminish the strangeness of the dream still more and we can demonstrate the influence of his other experiences of the previous day on the form taken by the manifest dream.

We may declare ourselves dissatisfied with the explanation that has hitherto been given of why it was that precisely the scene of the lizard-catching was made into the nucleus of the dream, and we may suspect that still other elements of the dream-thoughts were bringing their influence to bear in the emphasis that was laid on the 'lizard' in the manifest dream. Indeed, it may easily have been so. It will be recalled that Hanold had discovered a gap in the wall at the point where Gradiva had seemed to vanish - a gap 'which was nevertheless wide enough to allow a form that was unusually slim' to slip through. This observation led him in daytime to make an alteration in his delusion - an alteration to the effect that when Gradiva disappeared from his sight she did not sink into the earth but used the gap as a way of reaching her grave. In his unconscious thoughts he may have told himself that he had now discovered the natural explanation of the girl's surprising disappearance. But must not the idea of slipping through narrow gaps and disappearing in them have recalled the behaviour of lizards? Was not Gradiva herself in this way behaving like an agile little lizard? In our view, then, the discovery of the gap in the wall contributed to determining the choice of the element 'lizard' in the manifest content of the dream. The lizard situation in the dream represented this impression of the previous day as well as the encounter with Zoe's father, the zoologist.

And what if now, growing bold, we were to try to find a representation in the content of the dream of the one experience of the previous day which has not yet been exploited - the discovery of the third inn, the *Albergo del Sole*? The author has treated this episode at such length and has linked so many things to it that it would surprise us if it alone had made no contribution to the construction of the dream. Hanold went into this inn, which, owing to its out-of-the-way situation and its distance from the railway station, had remained unknown to him, to purchase a bottle of soda-water to cool his heated blood. The landlord took the opportunity of displaying his antiquities, and showed him a clasp which he pretended had belonged to the Pompeian girl who had been found in the neighbourhood of the Forum closely embraced by her lover. Hanold, who had never hitherto believed this often-repeated tale, was now compelled by a power unknown to him to believe in the truth of this moving story and in the genuineness of the find; he purchased the brooch and left the inn with his acquisition. As he was going out, he saw, standing in a glass of water in a window, a nodding sprig of asphodel covered with white blossoms, and took the sight of it as a confirmation of the genuineness of his new possession. He now felt a positive conviction that the green clasp had belonged to Gradiva and that she had been the girl who had died in her lover's arms. He quieted the jealousy which thereupon seized him, by deciding that next day he would show the clasp to Gradiva herself and arrive at certainty about his suspicion. It cannot be denied that this was a curious new piece of delusion; yet are we to suppose that no trace of it was to be found in his dream of the same night?

It will certainly be worth while to explain the origin of this addition to the delusion and to look for the fresh piece of unconscious discovery which was replaced by the fresh piece of delusion. The delusion appeared under the influence of the landlord of the 'Sun Hotel' to whom Hanold behaved in such a remarkably credulous fashion that it was almost as though he had been given a hypnotic suggestion by him. The landlord showed him a metal clasp for a garment, represented it as genuine and as having belonged to the girl who had been found buried in the arms of her lover; and Hanold, who was capable of being sufficiently critical to doubt both the truth of the story and the genuineness of the clasp, was at once taken in, and purchased the highly dubious antique. Why he should have behaved in this way is quite incomprehensible, and there is nothing to suggest that the landlord's personality might offer us a solution. But there is yet another riddle about the incident, and two riddles often solve each other. As he was leaving the *albergo* he saw a sprig of asphodel standing in a glass in a window and took it as a confirmation of the genuineness of the metal clasp. How could that have come about? But fortunately this last point is easy to solve. The white flower was no doubt the one which he had given to Gradiva at mid-day, and it is perfectly true that something was confirmed by the sight of it in the window of the inn. Not, it is true, the genuineness of the clasp, but something else that had already become clear to him when he discovered this *albergo* after having previously overlooked it. Already on the day before he had behaved as though he was searching in the two Pompeii hotels to find the person who appeared to him as Gradiva. And now, since he had so unexpectedly come upon a third one, he must have said to himself in his unconscious: 'So *this* is where she is staying!' And added, as he was going out: 'Yes, that's right! There's the asphodel that I gave her! So that's her window!' This then was the new discovery which was replaced by the delusion, and which could not become conscious because its underlying postulate that Gradiva was a living person whom he had once known could not become conscious.

But how did the replacement of the new discovery by the delusion take place? What happened, I think, was that the sense of conviction attaching to the discovery was able to persist and was retained, while the discovery itself, which was inadmissible to consciousness, was replaced by another ideational content connected with it by associations of thought. Thus the sense of conviction became attached to a content which was in fact foreign to it and this, in the form of a delusion, won a recognition which did not apply to it. Hanold transferred his conviction that Gradiva lived in the house to other impressions which he had received in the house; this led to his credulity in regard to the landlord's remarks, the genuineness of the metal clasp and the truth of the anecdote about the discovery of the embracing lovers - but only through his linking what he heard in the house with Gradiva. The jealousy which was already latent in him seized upon this material and the consequence was the delusion (though it contradicted his first dream) that Gradiva was the girl who had died in her lover's arms and that the clasp he had bought had belonged to her.

It will be observed that his conversation with Gradiva and her hint at wooing him (her 'saying it with flowers') had already brought about important changes in Hanold. Traits of masculine desire - components of the libido - had awakened in him, though it is true that they could not yet dispense with the disguise of conscious pretexts. But the problem of the 'bodily nature' of Gradiva, which pursued him all that day, cannot disavow its origin in a young man's erotic curiosity about a woman's body, even if it is involved in a scientific question by the conscious insistence on Gradiva's peculiar oscillation between death and life. His jealousy was a further sign of the increasingly active aspect of Hanold's love; he expressed this jealousy at the beginning of their conversation the next day and with the help of a fresh pretext proceeded to touch the girl's body and, as he used to do in the far-off past, to hit her.

But it is now time to ask ourselves whether the method of constructing a delusion which we have inferred from our author's account is one that is known from other sources, or whether, indeed, it is possible at all. From our medical knowledge we can only reply that it is certainly the correct method, and perhaps the sole method, by which a delusion acquires the unshakable conviction which is one of its clinical characteristics. If a patient believes in his delusion so firmly, this is not because his faculty of judgement has been overturned and does not arise from what is false in the delusion. On the contrary, there is a grain of truth concealed in every delusion, there is something in it that really deserves belief, and this is the source of the patient's conviction, which is therefore to that extent justified. This true element, however, has long been repressed. If eventually it is able to penetrate into consciousness, this time in a distorted form, the sense of conviction attaching to it is over-intensified as though by way of compensation and is now attached to the distorted substitute of the repressed truth, and protects it from any critical attacks. The conviction is displaced, as it were, from the unconscious truth on to the conscious error that is linked to it, and remains fixated there precisely as a result of this displacement. The instance of the formation of a delusion which arose from Hanold's first dream is no more than a similar, though not identical, example of such a displacement. Indeed, the method described here by which conviction arises in the case of a delusion does not differ fundamentally from the method by which a conviction is formed in normal cases, where repression does not come into the picture. We all attach our conviction to thought-contents in which truth is combined with error, and let it extend from the former over the latter. It becomes diffused, as it were, from the truth over the error associated with it and protects the latter, though not so unalterably as in the case of a delusion, against deserved criticism. In normal psychology, too, being well-connected - 'having influence', so to speak - can take the place of true worth.

I will now return to the dream and bring out a small but not uninteresting feature in it, which forms a connection between two of its provoking causes. *Gradiva* had drawn a kind of contrast between the white asphodel blossoms and the red rose. Seeing the asphodel again in the window of the *Albergo del Sole* became an important piece of evidence in support of Hanold's unconscious discovery, which was expressed in the new delusion; and alongside this was the fact that the red rose in the dress of the sympathetic girl helped Hanold in his unconscious to a correct view of her relation to her companion, so that he was able to make her appear in the dream as the 'lady colleague'.

But where in the manifest content of the dream, it will be asked, do we find anything to indicate and replace the discovery for which, as we have seen, Hanold's new delusion was a substitute - the discovery that *Gradiva* was staying with her father in the third, concealed Pompeii hotel, the *Albergo del Sole*? Nevertheless it is all there in the dream, and not even very much distorted, and I merely hesitate to point to it because I know that even those of my readers who have followed me patiently so far will begin to rebel strongly against my attempts at interpretation. Hanold's discovery, I repeat, is fully announced in the dream, but so cleverly concealed that it is bound to be overlooked. It is hidden behind a play upon words, an ambiguity. 'Somewhere in the sun *Gradiva* was sitting.' We have quite correctly related this to the spot where Hanold met her father, the zoologist. But could it not also mean in the 'Sun' - that is, *Gradiva* is staying in the *Albergo del Sole*, the Sun Hotel? And was not the 'somewhere', which had no bearing on the encounter with her father, made to sound so hypocritically indefinite precisely because it introduced a definite piece of information about the place where *Gradiva* was staying? From my experience elsewhere of real dreams, I myself am perfectly certain that this is how the ambiguity is to be understood. But I should not in fact have ventured to present this piece of interpretative work to my readers, if the author had not at this point lent me his powerful assistance. He puts the very same play upon words into the girl's mouth when next day she saw the metal clasp: 'Did you find it in the sun, perhaps, which produces things of this kind?' And since Hanold failed to understand what she had said, she explained that she meant the Sun Hotel, which they call 'Sole' here, and where she had already seen the supposititious antique.

And now let us make a bold attempt at replacing Hanold's 'remarkably senseless' dream by the unconscious thoughts that lay behind it and were as unlike it as possible. They ran, perhaps, as follows: 'She is staying in the "Sun" with her father. Why is she playing this game with me? Does she want to make fun of me? Or can it possibly be that she loves me and wants to have me as her husband?' - And no doubt while he was still asleep there came an answer dismissing this last possibility as 'the merest madness', a comment which was ostensibly directed against the whole manifest dream.

Critical readers will now justly enquire about the origin of the interpolation (for which I have so far given no grounds) of the reference to being ridiculed by Gradiva. The answer to this is given in *The Interpretation of Dreams*, which explains that if ridicule, derision, or embittered contradiction occurs in the dream-thoughts, this is expressed by the manifest dream being given a senseless form, by absurdity in the dream. This absurdity does not mean, therefore, that there is any paralysis of psychical activity: it is a method of representation employed by the dream-work. As always happens at specially difficult points, the author once more comes to our help here. The senseless dream had a short epilogue, in which a bird uttered a laughing call and carried the lizard away in its beak. But Hanold had heard a similar laughing call after Gradiva's disappearance. It had in fact come from Zoe, who with this laugh was shaking off the gloomy seriousness of her underworld role. Gradiva had really laughed at him. But the dream-image of the bird carrying off the lizard may have been a recollection of the earlier dream, in which the Apollo Belvedere carried off the Capitoline Venus.

There may still be some readers who feel that the translation of the situation of lizard-catching by the idea of wooing has not been sufficiently well established. Some further support for it may be afforded by the consideration that Zoe in her conversation with her newly-married friend admitted precisely what Hanold's thoughts about her suspected - when she told her she had felt sure that she would 'dig out' something interesting in Pompeii. Here she was trespassing into the field of archaeology, just as he had trespassed, with his simile of lizard-catching, into the field of zoology; it was as though they were struggling towards each other and each were trying to assume the other's character.

Here then we seem to have finished off the interpretation of this second dream as well. Both of them have been made intelligible to us on the presupposition that a dreamer knows in his unconscious thoughts all that he has forgotten in his conscious ones, and that in the former he judges correctly what in the latter he misunderstands in a delusion. In the course of our arguments we have no doubt been obliged to make some assertions which have seemed strange to the reader because of their unfamiliarity; and we have probably often roused a suspicion that what we pretended was the author's meaning was in fact only our own. I am anxious to do all I can to dissipate this suspicion, and for that reason I will gladly enter into more detail over one of the most delicate points - I mean the use of ambiguous words and phrases, such as: 'Somewhere in the Sun *Gradiva* was sitting.'

Anyone who reads *Gradiva* must be struck by the frequency with which the author puts ambiguous remarks into the mouths of his two principal characters. In Hanold's case these remarks are intended by him unambiguously and it is only the heroine, Gradiva, who is struck by their second meaning. Thus, for instance, when in reply to her first answer he exclaimed 'I knew your voice sounded like that', Zoe, who was still in ignorance, could not but ask how that could be, since he had not heard her speak before. In their second conversation the girl was for a moment thrown into doubt about his delusion, when he told her that he had recognized her at once. She could not help taking these words in the sense (correct so far as his unconscious was concerned) of being a recognition that their acquaintance went back to their childhood; whereas he, of course, knew nothing of this implication of his remark and explained it only by reference to his dominant delusion. On the other hand, the remarks made by the girl, whose personality shows the most lucid clarity of mind in contrast to Hanold's delusion, exhibit an *intentional* ambiguity. One of their meanings chimes in with Hanold's delusion, so as to be able to penetrate into his conscious understanding, but the other rises above the delusion and gives us as a rule its translation into the unconscious truth for which it stands. It is a triumph of ingenuity and wit to be able to express the delusion and the truth in the same turn of words.

Zoe's speech in which she explains the situation to her friend and at the same time succeeds in getting rid of the interrupter is full of ambiguities of this kind. It is in reality a speech made by the author and aimed more at the reader than at Zoe's newly-married 'colleague'. In her conversations with Hanold the ambiguity is usually effected by Zoe's using the same symbolism that we found in Hanold's first dream - the equation of repression and burial, and of Pompeii and childhood. Thus she is able in her speeches on the one hand to remain in the role for which Hanold's delusion has cast her, and on the other hand to make contact with the real circumstances and awaken an understanding of them in Hanold's unconscious.

'I have long grown used to being dead.' (90.) 'To me it is right that you should give the flower of forgetfulness.' [Ibid.] In these sentences there was a faint foretaste of the reproaches which broke out clearly enough later on in her final lecture to him, in which she compared him to an archaeopteryx. 'The fact of someone having to die so as to come alive; but no doubt that must be so for archaeologists.' She made this last remark after the delusion had been cleared up, as though to give a key to her ambiguous speeches. But she made her neatest use of her symbolism when she asked: 'I feel as though we had shared a meal like this once before, two thousand years ago; can't you remember?' (118.) Here the substitution of the historical past for childhood and the effort to awaken the memory of the latter are quite unmistakable.

But whence comes this striking preference for ambiguous speeches in *Gradiva*? It is no chance event, so it seems to us, but a necessary consequence of the premisses of the story. It is nothing other than a counterpart to the twofold determination of symptoms, in so far as speeches are themselves symptoms and, like them, arise from compromises between the conscious and the unconscious. It is simply that this double origin is more easily noticed in speeches than, for instance, in actions. And when, as is often made possible by the malleable nature of the material of speech, each of the two intentions lying behind the speech can be successfully expressed in the same turn of words, we have before us what we call an 'ambiguity'.

In the course of the psychotherapeutic treatment of a delusion or of an analogous disorder, ambiguous speeches of this kind are often produced by the patient, as new symptoms of the briefest duration; and it can happen that the doctor finds himself too in the position of making use of them. In that way it not infrequently happens that with the meaning that is intended for the patient's conscious he stirs up an understanding of the meaning that applies to his unconscious. I know from experience that the part thus played by ambiguity is apt to raise the greatest objection in the uninitiated and to give rise to the greatest misunderstandings. But in any case our author was right in giving a place in his creation to a picture of this characteristic feature of what takes place in the formation of dreams and delusions.

IV

The emergence of Zoe as a physician, as I have already remarked, arouses a new interest in us. We shall be anxious to learn whether a cure of the kind she performed upon Hanold is conceivable or even possible, and whether the author has taken as correct a view of the conditions for the disappearance of a delusion as he has of those for its genesis.

We shall unquestionably be met at this point by an opinion which denies that the case presented by the author possesses any such general interest and disputes the existence of any problem requiring solution. Hanold, it will be said, had no alternative but to abandon his delusion, after its subject, the supposed 'Gradiva' herself, had shown him that all his hypotheses were incorrect and after she had given him the most natural explanations of everything puzzling - for instance, of how it was that she had known his name. This would be the logical end of the matter; but since the girl had incidentally revealed her love to him, the author, no doubt to the satisfaction of his female readers, arranged that his story, a not uninteresting one otherwise, should have the usual happy ending in marriage. It would have been more consistent and equally possible, the argument will proceed, if the young scientist, after his error had been pointed out, had taken his leave of the lady with polite thanks and given as the reason for refusing her love the fact that he was able to feel an intense interest in antique women made of bronze or marble, and in their originals if they were accessible to contact, but that he did not know what to do with contemporary girls of flesh and blood. The author, in short, had quite arbitrarily tacked a love story on to his archaeological phantasy.

In rejecting this view as an impossible one, we observe in the first place that the beginnings of a change in Hanold were not shown only in his abandoning his delusion. Simultaneously, and indeed before his delusion was cleared up, an unmistakable craving for love awakened in him, which found its outcome, naturally as it were, in his courting the girl who had freed him from his delusion. We have already laid emphasis on the pretexts and disguises under which his curiosity about her 'bodily nature', his jealousy, and his brutal masculine instinct for mastery were expressed in the midst of his delusion, after his repressed erotic desire had led to his first dream. As further evidence of this we may recall that on the evening after his second interview with Gradiva a live woman for the first time struck him as sympathetic, though he still made a concession to his earlier horror of honeymooning couples by not recognizing her as being newly married. Next morning, however, he was a chance witness of an exchange of endearments between the girl and her supposed brother, and he withdrew with a sense of awe as though he had interrupted some sacred act. His derision of 'Edwin and Angelina' was forgotten, and he had acquired a sense of respect for the erotic side of life.

Thus the author has drawn the closest link between the clearing up of the delusion and the outbreak of a craving for love, and he has paved the way for the inevitable outcome in a courtship. He knows the essential nature of the delusion better than his critics: he knows that a component of loving desire had combined with a component of resistance to it in bringing about the delusion, and he makes the girl who undertakes the cure sensitive to the element in Hanold's delusion which is agreeable to her. It was only this knowledge which could decide her to devote herself to the treatment; it was only the certainty of being loved by him that could induce her to admit her love to him. The treatment consisted in giving him back from outside the repressed memories which he could not set free from inside; but it would have had no effect if in the course of it the therapist had not taken his feelings into account and if her ultimate translation of the delusion had not been: 'Look, all this only means that you love me.'

The procedure which the author makes his Zoe adopt for curing her childhood friend's delusion shows a far-reaching similarity - no, a complete agreement in its essence - with a therapeutic method which was introduced into medical practice in 1895 by Dr. Josef Breuer and myself, and to the perfecting of which I have since then devoted myself. This method of treatment, to which Breuer first gave the name of 'cathartic' but which I prefer to describe as 'analytic', consists, as applied to patients suffering from disorders analogous to Hanold's delusion, in bringing to their consciousness, to some extent forcibly, the unconscious whose repression led to their falling ill - exactly as Gradiva did with the repressed memories of their childhood relations. Gradiva, it is true, could carry out this task more easily than a doctor: in several respects she was in what may be described as an ideal position for it. The doctor, who has no pre-existing knowledge of his patient and possesses no conscious memory of what is unconsciously at work in him, must call a complicated technique to his help in order to make up for this disadvantage. He must learn how to infer with great certainty from the conscious associations and communications of the patient what is repressed in him, how to discover his unconscious as it betrays itself behind his conscious words and acts. He then brings about something like what Norbert Hanold grasped at the end of the story when he translated back the name 'Gradiva' into 'Bertgang'. The disorder vanishes while being traced back to its origin; analysis, too, brings simultaneous cure.

But the similarity between Gradiva's procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold's delusion, what in scientific terms we are in the habit of calling 'psychoneuroses', has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term 'love'; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of *Gradiva* reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.

It is here that the differences begin, which made the case of *Gradiva* an ideal one which medical technique cannot attain. *Gradiva* was able to return the love which was making its way from the unconscious into consciousness, but the doctor cannot. *Gradiva* had herself been the object of the earlier, repressed love; her figure at once offered the liberated current of love a desirable aim. The doctor has been a stranger, and must endeavour to become a stranger once more after the cure; he is often at a loss what advice to give the patients he has cured as to how in real life they can use their recovered capacity to love. To indicate the expedients and substitutes of which the doctor therefore makes use to help him to approximate with more or less success to the model of a cure by love which has been shown us by our author - all this would take us much too far away from the task before us.

And now for the final question, whose answer we have already evaded more than once. Our views on repression, on the genesis of delusions and allied disorders, on the formation and solution of dreams, on the part played by erotic life, and on the method by which such disorders are cured, are far from being the common property of science, let alone the assured possession of educated people. If the insight which has enabled the author to construct his 'phantasy' in such a way that we have been able to dissect it like a real case history is in the nature of knowledge, we should be curious to learn what were the sources of that knowledge. One of our circle - the one who, as I said at the beginning, was interested in the dreams in *Gradiva* and their possible interpretation - approached the author with the direct question whether he knew anything of such scientific theories as these. The author replied, as was to be expected, in the negative, and, indeed, somewhat brusquely. His imagination, he said, had inspired *Gradiva*, and he had enjoyed it; if there was anyone whom it did not please, let him simply leave it alone. He had no suspicion of how greatly it had in fact pleased his readers.

It is quite possible that the author's disavowal does not stop at this. He may perhaps altogether deny any knowledge of the rules which we have shown that he has followed, and he may repudiate all the purposes we have recognized in his work. I do not regard this as improbable; but if it is so, there are only two possible explanations. It may be that we have produced a complete caricature of an interpretation by introducing into an innocent work of art purposes of which its creator had no notion, and by so doing have shown once more how easy it is to find what one is looking for and what is occupying one's own mind - a possibility of which the strangest examples are to be found in the history of literature. Let every reader now make up his mind whether he is able to accept this explanation. We ourselves, of course, hold to the other view, the remaining alternative. Our opinion is that the author need have known nothing of these rules and purposes, so that he could disavow them in good faith, but that nevertheless we have not discovered anything in his work that is not already in it. We probably draw from the same source and work upon the same object, each of us by another method. And the agreement of our results seems to guarantee that we have both worked correctly. Our procedure consists in the conscious observation of abnormal mental processes in other people so as to be able to elicit and announce their laws. The author no doubt proceeds differently. He directs his attention to the unconscious in his own mind, he listens to its possible developments and lends them artistic expression instead of suppressing them by conscious criticism. Thus he experiences from himself what we learn from others - the laws which the activities of this unconscious must obey. But he need not state these laws, nor even be clearly aware of them; as a result of the tolerance of his intelligence, they are incorporated within his creations. We discover these laws by analysing his writings just as we find them from cases of real illness; but the conclusion seems inescapable that either both of us, the writer and the doctor, have misunderstood the unconscious in the same way, or we have both understood it correctly. This conclusion is of great value to us, and it is on its account that it has been worth while to investigate by the methods of medical psycho-analysis the way in which the formation and the cure of the delusions as well as the dreams are represented in Jensen's *Gradiva*.

We would seem to have reached the end. But an attentive reader might remind us that at the beginning we threw out an assertion that dreams are wishes represented as fulfilled and that we gave no proof of this. Well, is our reply, what we have described in these pages might show how little justification there is for trying to cover the explanations we have to give of dreams with the single formula that dreams are wish-fulfilments. Nevertheless the assertion stands and can easily be proved too for the dreams in *Gradiva*. The latent dream-thoughts - we know now what is meant by them - may be of the most various kinds; in *Gradiva* they are 'days' residues', thoughts that have been left over unnoticed and undealt-with from the mental activities of waking life. But in order for a dream to develop out of them, the co-operation of a wish (usually an unconscious one) is required; this contributes the motive force for constructing the dream, while the day's residues provide the material. In Norbert Hanold's first dream two wishes competed with each other in making the dream; one of them was actually admissible to consciousness, while the other belonged to the unconscious and operated from out of repression. The first was a wish, understandable in any archaeologist, to have been present as an eye-witness at the catastrophe in the year 79 A.D. What sacrifice would an archaeologist think too great if this wish could be realized in any way other than in a dream! The other wish, the other constructor of the dream, was of an erotic nature: it might be crudely and also incompletely stated as a wish to be there when the girl he loved lay down to sleep. This was the wish the rejection of which caused the dream to become an anxiety-dream. The wishes that were the motive forces of the second dream are perhaps less conspicuous; but if we recall its translation we shall not hesitate to describe them too as erotic. The wish to be taken captive by the girl he loved, to fall in with her wishes and to be subjected to her - for so we may construe the wish behind the situation of the lizard-catching - was in fact of a passive, masochistic character. Next day the dreamer hit the girl, as though he was dominated by the contrary erotic current . . . But we must stop here, or we may really forget that Hanold and *Gradiva* are only creatures of their author's mind.

POSTSCRIPT TO THE SECOND EDITION (1912)

In the five years that have passed since this study was completed, psycho-analytic research has summoned up the courage to approach the creations of imaginative writers with yet another purpose in view. It no longer merely seeks in them for confirmations of the findings it has made from unpoetic, neurotic human beings; it also demands to know the material of impressions and memories from which the author has built the work, and the methods and processes by which he has converted this material into a work of art. It has turned out that these questions can be most easily answered in the case of writers who (like our Wilhelm Jensen, who died in 1911) were in the habit of giving themselves over to their imagination in a simple-minded joy in creating. Soon after the publication of my analytic examination of *Gradiva* I attempted to interest the elderly author in these new tasks of psycho-analytic research. But he refused his co-operation.

A friend of mine has since then drawn my attention to two other of the author's short stories, which might stand in a genetic relation to *Gradiva*, as preliminary studies or earlier attempts at a satisfactory poetical solution of the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',¹ recalls *Gradiva* by the recurrence in it of a number of small *motifs*, such as white flowers of the dead, a forgotten object (*Gradiva*'s sketch-book), and a significant small animal (the butterfly and the lizard in *Gradiva*), but more especially by the repetition of the main situation - the apparition in the mid-day glare of a summer's day of a girl who had died (or was believed to have died). In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in *Gradiva*. The other story, 'Im gotischen Hause',² shows no such resemblances either to *Gradiva* or to 'Der rote Schirm' in its manifest content. But the fact that it was given an external unity with the latter story by being published with it under a common title³ points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper *Die Zeit* of February 11, 1912) that Jensen's last novel *Fremdlinge unter den Menschen*,⁴ which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main *motif* of *Gradiva*: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot.

The relief of the girl who steps along in this way, which Jensen describes as being Roman, and to which he gives the name of 'Gradiva', is in fact derived from the zenith of Greek art. It is in the Museo Chiaramonti in the Vatican (No. 644), and has been restored and interpreted by Hauser. By the combination of 'Gradiva' and some other fragments, in Florence and Munich, two reliefs were obtained, each representing three figures, who seem to be identified as the Horae, the goddesses of vegetation, and the deities of the fertilizing dew who are allied to them.

PSYCHO-ANALYSIS AND THE ESTABLISHMENT OF THE FACTS
IN LEGAL PROCEEDINGS
(1906)

Intentionally left blank

PSYCHO-ANALYSIS AND THE ESTABLISHMENT OF THE FACTS IN LEGAL PROCEEDINGS

Gentlemen, -There is a growing recognition of the untrustworthiness of statements made by witnesses, on which, nevertheless, so many convictions are based to-day in court cases; and this has quickened in all of you, future judges and defending counsel, an interest in a new method of investigation, the aim of which is to compel the accused person himself to establish his own guilt or innocence by objective signs. This method consists in a psychological experiment and is based on psychological research. It is closely connected with certain views which have only recently come to the notice of medical psychology. I understand that you are already engaged in testing the use and possibilities of this new method by means of what might be called 'dummy exercises', and I have gladly accepted the invitation of your President, Professor Löffler, to explain to you more fully the relation of this method to psychology.

You are all acquainted with the game played at parties or among children in which a word is called out at random and someone has to add a second word, which, when it is added to the first, results in a compound word being formed. For instance, 'steam' - 'ship', making 'steam-ship'. The 'association experiment' introduced into psychology by the school of Wundt is nothing more than a modification of this children's game, merely omitting one rule of the game.

The experiment is as follows: a word (termed the 'stimulus word') is called out to the subject and he replies as quickly as possible with some other word that occurs to him (the so called 'reaction'), his choice of this reaction not being restricted by anything. The points to be observed are the *time* required for the reaction and the *relation* - which may be of many different kinds - between the stimulus-word and the reaction-word. It cannot be claimed that in the first instance very much came of these experiments. This was to be expected, however, since they were carried out without framing any definite question and without any guiding idea which could be brought to bear on the results. They only became significant and fruitful when Bleuler in Zurich and his pupils, especially Jung, began to turn their attention to these 'association experiments'. The experiments which they carried out acquired their value from the fact that they assumed that the reaction to the stimulus-word could not be a chance one but must be determined by an ideational content present in the mind of the reacting subject.

It has become customary to speak of an ideational content of this kind, which is able to influence the reaction to the stimulus-word, as a 'complex'. This influence works either by the stimulus-word touching the complex directly or by the complex succeeding in making a connection with the word through intermediate links. Such a determination of the reaction is a very remarkable fact; you will find undisguised astonishment expressed at it in the literature of the subject. But its truth admits of no doubt. For as a rule you can lay bare the particular complex at work, and so explain reactions which could not otherwise be understood, by asking the subject himself to give the reasons for his reaction. Examples like those given by Jung (1906, 6 and 8-9) are well calculated to make us doubt the occurrence of chance or of what is alleged to be arbitrary in mental events.

Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901¹ I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

¹ *The Psychopathology of Everyday Life.*

And now, Gentlemen, let us return to the association experiment. In the kind of experiment we have referred to so far, it was the person under examination who explained to us the origin of his reactions, and the experiments, if they are subject to this condition, will be of no interest from the point of view of judicial procedure. But how would it be if we were to make a change in our planning of the experiment? Might we not proceed as one does in solving an equation which involves several quantities, where one can take any one of them as the starting-point - by making *either* the *a* *or* the *b* into the *x* we are looking for? Up to now in our experiments it has been the *complex* that has been unknown to us. We have used stimulus-words selected at random, and the subject under examination has revealed to us the complex brought to expression by those stimulus-words. But let us now set about it differently. Let us take a complex that is *known* to us and ourselves react to it with stimulus-words deliberately chosen; and let us then transfer the *x* to the person who is reacting. Will it then be possible to decide, from the way in which he reacts, whether the complex we have chosen is also present in him? You can see that this way of planning the experiment corresponds exactly to the method adopted by an examining magistrate who is trying to find out whether something of which he is aware is also known to the accused as an agent. Wertheimer and Klein, two pupils of Hans Gross, the Professor of Criminal Law in Prague, seem to have been the first to adopt this change, which is of such importance for your purposes, in the planning of the experiment.¹

¹ Cf. Jung, 1906.

You already know from your own experiments that in this question of the subject's reactions, several points are to be taken into account in deciding whether he possesses the complex to which *you* are reacting with your stimulus-words. I will enumerate these points for you one by one. (1) The *content* of the reaction may be unusual, which requires explanation. (2) The *reaction-time* may be prolonged; for it appears that stimulus-words which have touched the complex produce a reaction only after a considerable delay (a delay which may be several times as long as the ordinary reaction-time). (3) There may be a mistake in *reproducing* the reaction. You know the remarkable fact that is meant by this. If the subject has been given an association experiment consisting of a comparatively long list of stimulus-words, and if a short time after the end of the experiment the stimulus words are once more presented to him, he will produce the same reactions as on the first occasion except when the stimulus-word has touched a complex, in which case he is very liable to replace his first reaction by another one. (4) The phenomenon of *perseveration* (or it might be better to use the term 'after-effect') may occur. When a complex is aroused by a stimulus-word which touches it - by a 'critical' stimulus-word - it often happens that the effects of this (for instance, a prolonging of the reaction-time) persist and alter the subject's reactions to the next, non-critical words as well. When all or several of these indications are present together, it proves that the complex which is known to us is present as a disturbing factor in the person who is being questioned. This disturbance is taken by you to mean that the complex in his mind is cathected with affect and is able to distract his attention from the task of reacting; thus you see in the disturbance a 'psychical self-betrayal'.

I know that you are at the moment concerned with the potentialities and difficulties of this procedure, whose aim is to lead the accused into an objective self-betrayal. I should therefore like to bring to your notice the fact that an exactly similar method of disclosing psychical material which is buried away or kept secret has been practised for more than a decade in another field. My purpose is to lay before you the resemblances and differences between conditions in the two fields.

The field I have in mind is indeed very different from yours. I am referring to the therapy employed for certain 'nervous diseases' - what are known as the psychoneuroses - of which hysteria and obsessional ideas may be taken as samples. The method is called 'psycho-analysis'; it was evolved by me from the 'cathartic' method of therapy first practised by Josef Breuer in Vienna.¹ To combat your surprise, I must draw an analogy between the criminal and the hysteric. In both we are concerned with a secret, with something hidden. But in order not to be paradoxical I must at once point out the difference. In the case of the criminal it is a secret which he knows and hides from you, whereas in the case of the hysteric it is a secret which he himself does not know either, which is hidden even from himself. How is this possible? Now we know, through laborious research, that all these illnesses are the result of the patient's having succeeded in repressing certain ideas and memories that are strongly cathected with affect, together with the wishes that arise from them, in such a way that they play no part in his thinking - do not enter into his consciousness - and thus remain unknown to him. But from this repressed psychical material (these 'complexes') are generated the somatic and psychical symptoms which plague the patient in just the same way as a guilty conscience does. In this one respect, therefore, the difference between the criminal and the hysteric is fundamental.

The task of the therapist, however, is the same as that of the examining magistrate. We have to uncover the hidden psychical material; and in order to do this we have invented a number of detective devices, some of which it seems that you gentlemen of the law are now about to copy from us.

¹ Cf. Breuer and Freud, *Studies on Hysteria*, 1895.

It will interest you, from the point of view of your own profession, to hear how we doctors proceed in psycho-analysis. After the patient has given us a first account of his history, we ask him to give himself up to the thoughts that occur to him spontaneously and to say without any critical reserve whatever comes into his head. We start, as you see, on the assumption, which he does not share in the least, that these spontaneous thoughts will not be arbitrarily chosen but will be determined by their relation to his secret - to his 'complex' - and may, as it were, be regarded as derivatives of that complex. You will note that this is the same assumption as the one with the help of which you were able to interpret the association experiments. But although we have instructed the patient to follow the rule of communicating all the thoughts that occur to him, he seems to be unable to do so. He soon begins to hold back first one thought and then another. He gives various reasons to account for this: either the thought was quite unimportant, or it was irrelevant or it was totally meaningless. We thereupon demand that he shall tell us the thought in spite of these objections and shall follow it up; for the very fact of his criticism proves to us that the thought belongs to the 'complex' which we are seeking to uncover. We recognize in this behaviour of the patient's a manifestation of the 'resistance' present in him, which we are never free from through the whole duration of the treatment. I will merely indicate briefly that this concept of resistance has acquired the highest importance for us in understanding the origin of an illness as well as the mechanism of its cure.

In your experiments you do not directly observe criticisms like these of his spontaneous ideas by the subject; while we, on the other hand, are able in our psycho-analyses to observe all the indications of a complex which come to your notice. When the patient no longer ventures to evade the rule which has been laid down for him, we nevertheless note that he stops or hesitates from time to time or pauses in the reproduction of his ideas. Every hesitation of this kind is, as we see it, an expression of his resistance and serves as an indication of a connection with the 'complex'. Indeed, we regard it as the most important sign of such a connection, just as is in your case the analogous prolongation of the *reaction-time*. We are accustomed to interpret hesitation in this sense even when the content of the idea that is being held back does not seem to be at all objectionable and when the patient assures us he cannot imagine why he should hesitate to tell it to us. The pauses which occur in psycho-analysis are as a rule many times longer than the delays that you observe in the reaction experiments.

Another of your indications of a complex - the change in the *content* of the reaction - also plays its part in the technique of psycho-analysis. We quite generally regard even slight deviations in our patients from the ordinary forms of expression as a sign of some hidden meaning, and we are quite willing to expose ourselves for a while to the patient's ridicule by making interpretations in that sense., all that we require in order to uncover the complex.

The third of your indications of a complex (mistakes - that is, changes - in the *reproduction*) is also employed, though in a more restricted field, in the technique of psycho-analysis. One task which often faces us is the interpretation of dreams - that is, the translation of the remembered content of a dream into its hidden meaning. It sometimes happens that we are uncertain at which point to set about the task, and in that case we may make use of a rule, discovered empirically, which recommends us to get the dreamer to tell us his dream once more. In doing so, he usually alters his modes of expression in some parts of it while repeating the rest accurately. The points at which his reproduction is defective owing to changes, and often owing to omissions as well, are the points which we fasten upon, because the inaccuracy guarantees a connection with the complex and promises the best approach to the secret meaning of the dream.¹

¹ See my *Interpretation of Dreams* (1900a).

You must not get the impression that we have come to an end of the points of agreement which I have been following up, if I admit to you that no phenomenon similar to *perseveration* is manifested in psycho-analysis. This apparent difference only arises from the special conditions of your experiments. For you do not allow the effect of the complex time to develop. Scarcely has it begun to act than you distract the subject's attention by a new and probably innocent stimulus word; and then you may observe that he sometimes continues to be occupied with the complex in spite of your interference. In psycho-analysis, on the other hand, we avoid such interferences and keep the patient occupied with the complex. Since in our procedure *everything*, so to speak, is perseveration, we cannot observe that phenomenon as an isolated occurrence.

We may justly claim that, in principle, techniques of the kind I have described enable us to make the patient conscious of what is repressed in him - of his secret - and thus to remove the psychological causation of the symptoms from which he is suffering. But before you draw any conclusions from these successful results as to the possibilities of your own work, we will examine some points of difference between the psychological situations in the two cases.

The chief difference has already been named. In the neurotic the secret is hidden from his own consciousness; in the criminal it is hidden only from you. In the former there is a genuine ignorance, though not an ignorance in every sense, while in the latter there is nothing but a pretence of ignorance. Connected with this is another difference, which is in practice of importance. In psycho-analysis the patient assists with his conscious efforts to combat his resistance, because he expects to gain something from the investigation, namely, his recovery. The criminal, on the other hand, does not work with you; if he did, he would be working against his whole ego. As though to make up for this, however, all you are endeavouring to arrive at in your investigation is an objective certainty on your part, whereas our therapy demands that the patient himself should also arrive at the same certainty. But it remains to be seen how far your procedure will be rendered more difficult or be altered by the lack of co-operation on the part of the subject of your examination. This is a situation which you can never create in your experiments in seminars, since the colleague who is playing the part of the accused man remains a fellow-worker after all, and assists you in spite of his conscious determination not to betray himself.

If you look more deeply into the comparison between the two situations it will become clear to you in general that psycho-analysis is concerned with a simpler, special, form of the task of uncovering what is hidden in the mind; whereas in your work the task is a more comprehensive one. That the case of the psychoneurotic is invariably concerned with a repressed sexual complex (in the widest sense) is a difference which you need not take into account. But there is something else that you must. The aim of psycho-analysis is absolutely uniform in every case: complexes have to be uncovered which have been repressed because of feelings of unpleasure and which produce signs of resistance if an attempt is made to bring them into consciousness. This resistance is as it were localized; it arises at the frontier between unconscious and conscious. In your cases what is concerned is a resistance which comes entirely from consciousness. You cannot dismiss this difference out of hand. You will first have to determine experimentally whether conscious resistance is betrayed by exactly the same indications as unconscious resistance. Further, you cannot yet be certain, in my opinion, whether you may interpret your objective indications of a complex as a 'resistance', as we psycho-therapists do. It may happen with your experimental subjects - even though not very frequently with criminals - that the complex you touch on is pleasurable toned; and the question then arises whether such a complex will produce the same reaction as a complex that is unpleasurably toned.

I should also like to point out that your test may possibly be subject to a complication which does not, by its very nature, arise in psycho-analysis. In your examination you may be led astray by a neurotic who, although he is innocent, reacts as if he were guilty, because a lurking sense of guilt that already exists in him seizes upon the accusation made in the particular instance. You must not regard this possibility as an idle fiction; you have only to think of life in the nursery, where such events can often enough be observed. It sometimes happens that a child who has been accused of a misdeed strongly denies the charge but at the same time weeps like a detected sinner. You may perhaps think that the child is lying when he asserts his innocence; but this is not necessarily so. It can be that he has in fact not committed the particular crime with which you have charged him but that he has committed one of which you know nothing and of which you are not accusing him. He therefore quite truthfully denies being guilty of the one misdeed, while at the same time betraying his sense of guilt on account of the other. In this respect - as in so many others - the adult neurotic behaves just like a child. Many people are like this, and it is still open to question whether your technique will succeed in distinguishing self-accusing individuals of this kind from those who are really guilty. Finally, one more point. You know that, according to the rules governing criminal proceedings, you may not subject the accused to any procedure which takes him by surprise. He will therefore have been made aware that in this experiment it is a matter for him of not betraying himself. It must then be asked whether one can expect the same reactions when the subject's attention is directed towards the complex as when it is directed away from it, and how far the intention to conceal something may affect modes of reaction in different people.

It is precisely because the situations which underlie your investigation are so various that psychology takes a very lively interest in its results, and I should like to beg you not to despair of their practical utility too soon. Although my work is so far removed from the practical administration of justice, perhaps you will allow me to make one further suggestion. However indispensable experiments in seminars may be for preparatory purposes and for the formulation of problems, you will never be able to reproduce in them the same psychological situation as in the examination of a defendant in a criminal case. The experiments remain dummy exercises and they can never afford a basis for practical application in criminal trials. If we do not want to abandon such an application of them, the following expedient suggests itself. You might be allowed - indeed, it might be made your duty - to undertake such examinations over a number of years in every actual instance of a criminal prosecution, *without their results being allowed to influence the verdict of the Court*. It would, indeed, be best if the Court were never informed of the conclusion which you had drawn from your examination on the question of the defendant's guilt. After years of collecting and comparing the results so obtained, all doubts about the serviceability of this psychological method of investigation would surely be resolved. I know, of course, that the realization of a proposal such as this does not rest only with you and your valued teachers.

1900

OBSESSIVE ACTIONS AND RELIGIOUS PRACTICES

I am certainly not the first person to have been struck by the resemblance between what are called obsessive actions in sufferers from nervous affections and the observances by means of which believers give expression to their piety. The term 'ceremonial', which has been applied to some of these obsessive actions, is evidence of this. The resemblance, however, seems to me to be more than a superficial one, so that an insight into the origin of neurotic ceremonials may embolden us to draw inferences by analogy about the psychological processes of religious life.

People who carry out obsessive actions or ceremonials belong to the same class as those who suffer from obsessive thinking, obsessive ideas, obsessive impulses and the like. Taken together, these form a particular clinical entity, to which the name of 'obsessional neurosis' [*Zwangsneurose*] is customarily applied.¹ But one should not attempt to deduce the character of the illness from its name; for, strictly speaking, other kinds of morbid mental phenomena have an equal claim to possessing what are spoken of as 'obsessional' characteristics. In place of a definition we must for the time being be content with obtaining a detailed knowledge of these states, since we have not yet been able to arrive at a criterion of obsessional neuroses; it probably lies very deep, although we seem to sense its presence everywhere in the manifestations of the illness.

¹ See Löwenfeld (1904).

Neurotic ceremonials consist in making small adjustments to particular everyday actions, small additions or restrictions or arrangements, which have always to be carried out in the same, or in a methodically varied, manner. These activities give the impression of being mere formalities, and they seem quite meaningless to us. Nor do they appear otherwise to the patient himself; yet he is incapable of giving them up, for any deviation from the ceremonial is visited by intolerable anxiety, which obliges him at once to make his omission good. Just as trivial as the ceremonial actions themselves are the occasions and activities which are embellished, encumbered and in any case prolonged by the ceremonial - for instance, dressing and undressing, going to bed or satisfying bodily needs. The performance of a ceremonial can be described by replacing it, as it were, by a series of unwritten laws. For instance, to take the case of the bed ceremonial: the chair must stand in a particular place beside the bed; the clothes must lie upon it folded in a particular order; the blanket must be tucked in at the bottom and the sheet smoothed out; the pillows must be arranged in such and such a manner, and the subject's own body must lie in a precisely defined position. Only after all this may he go to sleep. Thus in slight cases the ceremonial seems to be no more than an exaggeration of an orderly procedure that is customary and justifiable; but the special conscientiousness with which it is carried out and the anxiety which follows upon its neglect stamp the ceremonial as a 'sacred act'. Any interruption of it is for the most part badly tolerated, and the presence of other people during its performance is almost always ruled out.

Any activities whatever may become obsessive actions in the wider sense of the term if they are elaborated by small additions or given a rhythmic character by means of pauses and repetitions. We shall not expect to find a sharp distinction between 'ceremonials' and 'obsessive actions'. As a rule obsessive actions have grown out of ceremonials. Besides these two, prohibitions and hindrances (abulias) make up the content of the disorder; these, in fact, only continue the work of the obsessive actions, inasmuch as some things are completely forbidden to the patient and others only allowed subject to his following a prescribed ceremonial.

It is remarkable that both compulsions and prohibitions (having to do something and having *not* to do something) apply in the first instance only to the subject's solitary activities and for a long time leave his social behaviour unaffected. Sufferers from this illness are consequently able to treat their affliction as a private matter and keep it concealed for many years. And, indeed, many more people suffer from these forms of obsessional neurosis than doctors hear of. For many sufferers, too, concealment is made easier from the fact that they are quite well able to fulfil their social duties during a part of the day, once they have devoted a number of hours to their secret doings, hidden from view like Mélusine.

It is easy to see where the resemblances lie between neurotic ceremonials and the sacred acts of religious ritual: in the qualms of conscience brought on by their neglect, in their complete isolation from all other actions (shown in the prohibition against interruption) and in the conscientiousness with which they are carried out in every detail. But the differences are equally obvious, and a few of them are so glaring that they make the comparison a sacrilege: the greater individual variability of ceremonial actions in contrast to the stereotyped character of rituals (prayer, turning to the East, etc.), their private nature as opposed to the public and communal character of religious observances, above all, however, the fact that, while the minutiae of religious ceremonial are full of significance and have a symbolic meaning, those of neurotics seem foolish and senseless. In this respect an obsessional neurosis presents a travesty, half comic and half tragic, of a private religion. But it is precisely this sharpest difference between neurotic and religious ceremonial which disappears when, with the help of the psycho-analytic technique of investigation, one penetrates to the true meaning of obsessive actions.¹ In the course of such an investigation the appearance which obsessive actions afford of being foolish and senseless is completely effaced, and the reason for their having that appearance is explained. It is found that the obsessive actions are perfectly significant in every detail, that they serve important interests of the personality and that they give expression to experiences that are still operative and to thoughts that are cathected with affect. They do this in two ways, either by direct or by symbolic representation; and they are consequently to be interpreted either historically or symbolically.

¹ See the collection of my shorter papers on the theory of the neuroses published in 1906.

I must give a few examples to illustrate my point. Those who are familiar with the findings of psycho-analytic investigation into the psychoneuroses will not be surprised to learn that what is being represented in obsessive actions or in ceremonials is derived from the most intimate, and for the most part from the sexual, experiences of the patient.

(a) A girl whom I was able to observe was under a compulsion to rinse round her wash-basin several times after washing. The significance of this ceremonial action lay in the proverbial saying: 'Don't throw away dirty water till you have clean.' Her action was intended to give a warning to her sister, of whom she was very fond, and to restrain her from getting divorced from her unsatisfactory husband until she had established a relationship with a better man.

(b) A woman who was living apart from her husband was subject to a compulsion, whenever she ate anything, to leave what was the best of it behind: for example, she would only take the outside of a piece of roast meat. This renunciation was explained by the date of its origin. It appeared on the day after she had refused marital relations with her husband - that is to say, after she had given up what was the best.

(c) The same patient could only sit on one particular chair and could only get up from it with difficulty. In regard to certain details of her married life, the chair symbolized her husband, to whom she remained faithful. She found an explanation of her compulsion in this sentence: 'It is so hard to part from anything (a husband, a chair) upon which one has once settled.'

(d) Over a period of time she used to repeat an especially noticeable and senseless obsessive action. She would run out of her room into another room in the middle of which there was a table. She would straighten the table-cloth on it in a particular manner and ring for the housemaid. The latter had to come up to the table, and the patient would then dismiss her on some indifferent errand. In the attempts to explain this compulsion, it occurred to her that at one place on the table-cloth there was a stain, and that she always arranged the cloth in such a way that the housemaid was bound to see the stain. The whole scene proved to be a reproduction of an experience in her married life which had later on given her thoughts a problem to solve. On the wedding-night her husband had met with a not unusual mishap. He found himself impotent, and 'many times in the course of the night he came hurrying from his room into hers' to try once more whether he could succeed. In the morning he said he would feel ashamed in front of the hotel housemaid who made the beds, and he took a bottle of red ink and poured its contents over the sheet; but he did it so clumsily that the red stain came in a place that was very unsuitable for his purpose. With her obsessive action, therefore, she was representing the wedding-night. 'Bed and board' between them make up marriage.

(e) Another compulsion which she started - of writing down the number of every bank-note before parting with it - had also to be interpreted historically. At a time when she was still intending to leave her husband if she could find another more trustworthy man, she allowed herself to receive advances from a man whom she met at a watering-place, but she was in doubt as to whether his intentions were serious. One day, being short of small change, she asked him to change a five kronen piece for her. He did so, pocketed the large coin and declared with a gallant air that he would never part with it, since it had passed through her hands. At their later meetings she was frequently tempted to challenge him to show her the five-kronen piece, as though she wanted to convince herself that she could believe in his intentions. But she refrained, for the good reason that it is impossible to distinguish between coins of the same value. Thus her doubt remained unresolved; and it left her with the compulsion to write down the number of each bank-note, by which it *can* be distinguished from all others of the same value.

These few examples, selected from the great number I have met with, are merely intended to illustrate my assertion that in obsessive actions everything has its meaning and can be interpreted. The same is true of ceremonials in the strict sense, only that the evidence for this would require a more circumstantial presentation. I am quite aware of how far our explanations of obsessive actions are apparently taking us from the sphere of religious thought.

It is one of the conditions of the illness that the person who is obeying a compulsion carries it out without understanding its meaning - or at any rate its chief meaning. It is only thanks to the efforts of psycho-analytic treatment that he becomes conscious of the meaning of his obsessive action and, with it, of the motives that are impelling him to it. We express this important fact by saying that the obsessive action serves to express *unconscious* motives and ideas. In this, we seem to find a further departure from religious practices; but we must remember that as a rule the ordinary pious individual, too, performs a ceremonial without concerning himself with its significance, although priests and scientific investigators may be familiar with the - mostly symbolic - meaning of the ritual. In all believers, however, the motives which impel them to religious practices are unknown to them or are represented in consciousness by others which are advanced in their place.

Analysis of obsessive actions has already given us some sort of an insight into their causes and into the chain of motives which bring them into effect. We may say that the sufferer from compulsions and prohibitions behaves as if he were dominated by a sense of guilt, of which, however, he knows nothing, so that we must call it an unconscious sense of guilt, in spite of the apparent contradiction in terms. This sense of guilt has its source in certain early mental events, but it is constantly being revived by renewed temptations which arise whenever there is a contemporary provocation. Moreover, it occasions a lurking sense of expectant anxiety, an expectation of misfortune, which is linked, through the idea of punishment, with the internal perception of the temptation. When the ceremonial is first being constructed, the patient is still conscious that he must do this or that lest some ill should befall, and as a rule the nature of the ill that is to be expected is still known to his consciousness. But what is already hidden from him is the connection - which is always demonstrable - between the occasion on which this expectant anxiety arises and the danger which it conjures up. Thus a ceremonial starts as an *action for defence or insurance, a protective measure*.

The sense of guilt of obsessional neurotics finds its counterpart in the protestations of pious people that they know that at heart they are miserable sinners; and the pious observances (such as prayers, invocations, etc.) with which such people preface every daily act, and in especial every unusual undertaking, seem to have the value of defensive or protective measures.

A deeper insight into the mechanism of obsessional neurosis is gained if we take into account the primary fact which lies at the bottom of it. This is always *the repression of an instinctual impulse* (a component of the sexual instinct) which was present in the subject's constitution and which was allowed to find expression for a while during his childhood but later succumbed to suppression. In the course of the repression of this instinct a special *conscientiousness* is created which is directed against the instinct's aims; but this psychical reaction-formation feels insecure and constantly threatened by the instinct which is lurking in the unconscious. The influence of the repressed instinct is felt as a temptation, and during the process of repression itself anxiety is generated, which gains control over the future in the form of *expectant* anxiety. The process of repression which leads to obsessional neurosis must be considered as one which is only partly successful and which increasingly threatens to fail. It may thus be compared to an unending conflict; fresh psychical efforts are continually required to counterbalance the forward pressure of the instinct. Thus the ceremonial and obsessive actions arise partly as a defence against the temptation and partly as a protection against the ill which is expected. Against the temptation the protective measures seem soon to become inadequate; then the prohibitions come into play, with the purpose of keeping at a distance situations that give rise to temptation. Prohibitions take the place of obsessive actions, it will be seen, just as a phobia is designed to avert a hysterical attack. Again, a ceremonial represents the sum of the conditions subject to which something that is not yet absolutely forbidden is permitted, just as the Church's marriage ceremony signifies for the believer a sanctioning of sexual enjoyment which would otherwise be sinful. A further characteristic of obsessional neurosis, as of all similar affections, is that its manifestations (its symptoms, including the obsessive actions) fulfil the condition of being a compromise between the warring forces of the mind. They thus always reproduce something of the pleasure which they are designed to prevent; they serve the repressed instinct no less than the agencies which are repressing it. As the illness progresses, indeed, actions which were originally mostly concerned with maintaining the defence come to approximate more and more to the proscribed actions through which the instinct was able to find expression in childhood.

Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis.

We have noted as a curious and derogatory characteristic of obsessional neurosis that its ceremonials are concerned with the small actions of daily life and are expressed in foolish regulations and restrictions in connection with them. We cannot understand this remarkable feature of the clinical picture until we have realized that the mechanism of psychical *displacement*, which was first discovered by me in the construction of dreams,¹ dominates the mental processes of obsessional neurosis. It is already clear from the few examples of obsessive actions given above that their symbolism and the detail of their execution are brought about by a displacement from the actual, important thing on to a small one which takes its place - for instance, from a husband on to a chair. It is this tendency to displacement which progressively changes the clinical picture and eventually succeeds in turning what is apparently the most trivial matter into something of the utmost importance and urgency. It cannot be denied that in the religious field as well there is a similar tendency to a displacement of psychical values, and in the same direction, so that the petty ceremonials of religious practice gradually become the essential thing and push aside the underlying thoughts. That is why religions are subject to reforms which work retroactively and aim at a re-establishment of the original balance of values.

¹ See *The Interpretation of Dreams* (1900a), Chapter VI, Section B.

The character of compromise which obsessive actions possess in their capacity as neurotic symptoms is the character least easily detected in corresponding religious observances. Yet here, too, one is reminded of this feature of neuroses when one remembers how commonly all the acts which religion forbids - the expressions of the instincts it has suppressed - are committed precisely in the name of, and ostensibly for the sake of, religion.

In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of instincts that are constitutionally present; and the chief difference would lie in the nature of those instincts, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources.

A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: 'Vengeance is mine, saith the Lord.' In the development of the ancient religions one seems to discern that many things which man kind had renounced as 'iniquities' had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.

THE SEXUAL ENLIGHTENMENT OF CHILDREN
(AN OPEN LETTER TO DR. M. FÜRST)
(1907)

Intentionally left blank

THE SEXUAL ENLIGHTENMENT OF CHILDREN
(AN OPEN LETTER TO DR. M. FÜRST)

Dear Dr. Fürst,

When you ask me for an expression of opinion on 'the sexual enlightenment of children', I assume that what you want is not a regular, formal treatise on the subject which shall take into account the excessive mass of literature that has grown up around it, but the independent judgement of an individual doctor whose professional activities have offered him special opportunities for concerning himself with sexual problems. I know that you have followed my scientific efforts with interest and that, unlike many of our colleagues, you do not dismiss my ideas without examining them because I regard the psychosexual constitution and certain noxae of sexual life as the most important causes of the neurotic disorders that are so common. My *Three Essays on the Theory of Sexuality*, too, where I have described the way in which the sexual instinct is compounded and the disturbances which may occur in its development into the function of sexuality, have recently had a friendly reception in your journal.

I am expected, therefore, to answer questions on the following points: whether children ought to be given any enlightenment at all about the facts of sexual life, at what age this ought to happen and in what manner it should be carried out. Let me admit to you at once that I find a discussion of the second and third points perfectly reasonable, but that to my mind it is quite incomprehensible how there could be a difference of opinion on the first point. What can be the purpose of withholding from children - or, let us say, from young people - enlightenment of this kind about the sexual life of human beings? Is it from a fear of arousing their interest in these matters prematurely, before it awakens in them spontaneously? Is it from a hope that a concealment of this kind may retard the sexual instinct altogether until such time as it can find its way into the only channels open to it in our middle-class social order? Is it supposed that children would show no interest or understanding for the facts and riddles of sexual life if they were not prompted to do so by outside influences? Is it thought possible that the knowledge which is withheld from them will not reach them in other ways? Or is it genuinely and seriously intended that later on they should regard everything to do with sex as something degraded and detestable from which their parents and teachers wished to keep them away as long as possible?

I really do not know in which of these purposes to look for the motive for the concealment of what is sexual from children that is in fact carried out. I only know that they are all equally absurd and that I find it difficult to honour them with a serious refutation. I remember, however, that in the family letters of that great thinker and humanitarian Multatuli, I once found a few lines which are a more than adequate answer:

‘To my mind, certain things are in general too much wrapped in a veil. It is right to keep a child’s imagination pure, but this purity will not be preserved by ignorance. On the contrary, I think that concealment leads a boy or girl to suspect the truth more than ever. Curiosity leads us to pry into things which, if they had been told us without any great to do, would have aroused little or no interest in us. If this ignorance could be maintained even, I might become reconciled to it, but that is impossible. The child comes into contact with other children, books come his way which lead him to reflect, and the mystery-making with which his parents treat what he has nevertheless discovered actually increases his desire to know more. This desire, which is only partly satisfied and only in secret, excites his feeling and corrupts his imagination, so that the child already sins while his parents still believe that he does not know what sin is.’¹

¹ Multatuli, 1906, 1, 26.

I do not know how the case could be better stated, but perhaps I may add a few remarks. It is undoubtedly nothing else but the customary prudishness and their own bad conscience over sexual matters that causes adults to adopt this attitude of 'mystery-making' in front of children; but possibly a part is also played by a piece of theoretical ignorance on their part, which we can counteract by giving the adults some enlightenment. It is commonly believed that the sexual instinct is absent in children and only begins to emerge in them at puberty when the sexual organs mature. This is a gross error, equally serious in its effects both on knowledge and on practice; and it is so easily corrected by observation that one wonders how it could ever have been made. As a matter of fact, the new-born baby brings sexuality with it into the world, certain sexual sensations accompany its development as a suckling and during early childhood, and only very few children would seem to escape sexual activities and sensations before puberty. Anyone who would like to find a detailed exposition of these statements can do so in my *Three Essays on the Theory of Sexuality*, to which I have referred above. There he will learn that the organs of reproduction proper are not the only parts of the body which provide sexual sensations of pleasure, and that nature has even so ordered matters that actual stimulations of the genitals are unavoidable during early childhood. This period of life, during which a certain quota of what is undoubtedly sexual pleasure is produced by the excitation of various parts of the skin (erotogenic zones), by the activity of certain biological instincts and as an accompanying excitation in many affective states, is called the period of *auto-erotism*, to use a term introduced by Havelock Ellis. All that puberty does is to give the genitals primacy among all the other zones and sources which produce pleasure, and thus to force erotism into the service of the function of reproduction. This process can naturally undergo certain inhibitions, and in many people (those who later become perverts and neurotics) it is only incompletely accomplished. On the other hand, the child is capable long before puberty of most of the psychical manifestations of love-tenderness, for example, devotion and jealousy. Often enough, too, an irruption of these mental states is associated with the physical sensations of sexual excitation, so that the child cannot remain in doubt as to the connection between the two. In short, except for his reproductive power, a child has a fully-developed capacity for love long before puberty; and it may be asserted that the 'mystery-making' merely prevents him from being able to gain an intellectual grasp of activities for which he is psychically prepared and physically adjusted.

A child's intellectual interest in the riddles of sex, his desire for sexual knowledge, shows itself accordingly at an unexpectedly early age. If it has not been possible to make observations such as I am now going to put before you more frequently, that can only be because parents are either afflicted with blindness in regard to this interest on the part of their children, or, because, if they cannot overlook it, they at once take steps to stifle it. I know a delightful little boy, now four years old, whose understanding parents abstain from forcibly suppressing one part of the child's development. Little Hans has certainly not been exposed to anything in the nature of seduction by a nurse, yet he has already for some time shown the liveliest interest in the part of the body which he calls his 'widdler'. When he was only three he asked his mother: 'Mummy, have you got a widdler too?' His mother answered: 'Of course. What did you think?' He also asked his father the same question repeatedly. At the same age he was taken to a cow-shed for the first time and saw a cow being milked. 'Oh look!' he said, in surprise, 'there's milk coming out of its widdler!' At the age of three and three quarters he was on the way to making an independent discovery of correct categories by means of his observations. He saw some water being let out of an engine and said, 'Oh, look, the engine's widdling. Where's it got its widdler?' He added afterwards in reflective tones: 'A dog and a horse have widdlers; a table and a chair haven't.' Recently he was watching his seven-day-old little sister being given a bath. 'But her widdler's still quite small', he remarked; 'when she grows up it'll get bigger all right.' (I have been told of this same attitude towards the problem of sex distinction in other boys of similar age.) I should like to say explicitly that little Hans is not a sensual child or at all pathologically disposed. The fact is simply, I think, that, not having been intimidated or oppressed with a sense of guilt, he gives expression quite ingenuously to what he thinks.¹

¹ [*Footnote added 1924:*] The history of little Hans's later illness and recovery is described in my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*).

The second great problem which exercises a child's mind - only at a somewhat later age, no doubt - is the question of the origin of babies. This is usually started by the unwelcome arrival of a small brother or sister. It is the oldest and most burning question that confronts immature humanity. Those who understand how to interpret myths and legends can detect it in the riddle which the Theban Sphinx set to Oedipus. The customary answers given to the child in the nursery damage his genuine instinct of research and as a rule deal the first blow, too, at his confidence in his parents. From that time on he usually begins to mistrust grown-up people, and to keep his most intimate interests secret from them. The following little document shows how tormenting this curiosity can become in older children. It is a letter written by a motherless girl of eleven and a half who had been speculating on the problem with her younger sister.

'Dear Aunt Mali,

'Will you please be so kind as to tell me how you got Christel and Paul. You must know because you are married. We were arguing about it yesterday evening and we want to know the truth. We have nobody else to ask. When are you coming to Salzburg? You know, Aunt Mali, we simply can't understand how the stork brings babies. Trudel thought the stork brings them in a shirt. Then we want to know as well if the stork gets them out of the pond and why one never sees babies in ponds. And will you please tell me, too, how one knows beforehand when one is going to have one. Write and tell me everything about it.

'With thousands of greetings and kisses from us all,

'Your inquisitive niece,
Lili.'

I do not believe that this touching letter brought the two sisters the enlightenment they wanted. Later on the writer of it fell ill of the neurosis that arises from unanswered unconscious questions - of obsessional brooding.¹

¹ [*Footnote added 1924:*] After some years, however, her obsessional brooding gave way to a dementia praecox.

There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in favour of the 'goodness' which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers' sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual theories would be well worth collecting and examining. From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.

It seems that the large majority of authors, both men and women, who have written about the sexual enlightenment of youth have concluded in favour of it. But the clumsiness of most of their proposals as to when and how this enlightenment is to take place tempts one to think that they have not found it easy to arrive at this conclusion. So far as my knowledge of the literature goes, a single outstanding exception is provided by the charming letter of explanation which a certain Frau Emma Eckstein quotes as having been written by her to her son when he was about ten years old.¹ The customary method is obviously not quite the right one: all sexual knowledge is kept from children as long as possible, and then on one single occasion a disclosure is made to them in solemn and turgid language, and even so is only half the truth and generally comes too late. Most of the answers to the question 'How am I to tell my children?' make such a miserable impression, on me at least, that I should prefer parents not to embark on the business of enlightenment at all. What is really important is that children should never get the idea that one wants to make more of a secret of the facts of sexual life than of any other matter which is not yet accessible to their understanding; and to ensure this it is necessary that from the very first what has to do with sexuality should be treated like anything else that is worth knowing about. Above all, it is the duty of schools not to evade the mention of sexual matters. The main facts of reproduction and their significance should be included in lessons about the animal kingdom, and at the same time stress should be laid on the fact that man shares every essential in his organization with the higher animals. Then, provided that the child's home environment does not aim directly at frightening him off thinking, something that I once overheard in a nursery will probably happen more often. I heard a boy saying to his little sister: 'How can you think babies are brought by the stork! You know man's a mammal; d'you think storks bring other mammals their babies too?'

¹ Emma Eckstein, 1904.

The child's curiosity will never reach a very high degree of intensity provided it finds appropriate satisfaction at each stage of his learning. Enlightenment about the specific facts of human sexuality and an indication of its social significance should, therefore, be given to the child at the end of his time at his elementary school [*Volksschule*] and before he enters his intermediate school [*Mittelschule*] - that is to say, before he is ten years old. The period of confirmation would be a more suitable time than any other at which to instruct the child, who will by that time have a full knowledge of all the physical facts, in the moral obligations which are attached to the actual satisfaction of the instinct. Enlightenment about sexual life carried out along such lines as this, proceeding step by step and without any real interruption, and in which the school takes the initiative, seems to me to be the only kind which takes into account the child's development and thus successfully avoids the dangers involved.

I consider it the most significant advance in child education that in France the State should have introduced, in place of the catechism, a primer which gives the child his first instruction in his position as a citizen and in the ethical duties which will later devolve on him. But such elementary instruction is seriously deficient, so long as it does not include the field of sexuality. Here is the gap which educators and reformers should set about filling. In countries which have placed the education of children wholly or in part in the hands of the clergy, it will, of course, be impossible to ask for this. A priest will never admit that men and animals have the same nature, since he cannot do without the immortality of the soul, which he requires as the basis for moral precepts. Here, once again, we see the unwisdom of sewing a single silk patch on to a tattered coat - the impossibility of carrying out an isolated reform without altering the foundations of the whole system.

1920

CREATIVE WRITERS AND DAY-DREAMING

We laymen have always been intensely curious to know like the Cardinal who put a similar question to Ariosto - from what sources that strange being, the creative writer, draws his material, and how he manages to make such an impression on us with it and to arouse in us emotions of which, perhaps, we had not even thought ourselves capable. Our interest is only heightened the more by the fact that, if we ask him, the writer himself gives us no explanation, or none that is satisfactory; and it is not at all weakened by our knowledge that not even the clearest insight into the determinants of his choice of material and into the nature of the art of creating imaginative form will ever help to make creative writers of *us*.

If we could at least discover in ourselves or in people like ourselves an activity which was in some way akin to creative writing! An examination of it would then give us a hope of obtaining the beginnings of an explanation of the creative work of writers. And, indeed, there is some prospect of this being possible. After all, creative writers themselves like to lessen the distance between their kind and the common run of humanity; they so often assure us that every man is a poet at heart and that the last poet will not perish till the last man does.

Should we not look for the first traces of imaginative activity as early as in childhood The child's best-loved and most intense occupation is with his play or games. Might we not say that every child at play behaves like a creative writer, in that he creates a world of his own, or, rather, re-arranges the things of his world in a new way which pleases him? It would be wrong to think he does not take that world seriously; on the contrary, he takes his play very seriously and he expends large amounts of emotion on it. The opposite of play is not what is serious but what is real. In spite of all the emotion with which he cathects his world of play, the child distinguishes it quite well from reality; and he likes to link his imagined objects and situations to the tangible and visible things of the real world. This linking is all that differentiates the child's 'play' from 'phantasying'.

The creative writer does the same as the child at play. He creates a world of phantasy which he takes very seriously - that is, which he invests with large amounts of emotion while separating it sharply from reality. Language has preserved this relationship between children's play and poetic creation. It gives [in German] the name of '*Spiel*' ['play'] to those forms of imaginative writing which require to be linked to tangible objects and which are capable of representation. It speaks of a '*Lustspiel*' or '*Trauerspiel*' ['comedy' or 'tragedy': literally, 'pleasure play' or 'mourning play'] and describes those who carry out the representation as '*Schauspieler*' ['players': literally 'show-players']. The unreality of the writer's imaginative world, however, has very important consequences for the technique of his art; for many things which, if they were real, could give no enjoyment, can do so in the play of phantasy, and many excitements which, in themselves, are actually distressing, can become a source of pleasure for the hearers and spectators at the performance of a writer's work.

There is another consideration for the sake of which we will dwell a moment longer on this contrast between reality and play. When the child has grown up and has ceased to play, and after he has been labouring for decades to envisage the realities of life with proper seriousness, he may one day find himself in a mental situation which once more undoes the contrast between play and reality. As an adult he can look back on the intense seriousness with which he once carried on his games in childhood; and, by equating his ostensibly serious occupations of to-day with his childhood games, he can throw off the too heavy burden imposed on him by life and win the high yield of pleasure afforded by *humour*.

As people grow up, then, they cease to play, and they seem to give up the yield of pleasure which they gained from playing. But whoever understands the human mind knows that hardly anything is harder for a man than to give up a pleasure which he has once experienced. Actually, we can never give anything up; we only exchange one thing for another. What appears to be a renunciation is really the formation of a substitute or surrogate. In the same way, the growing child, when he stops playing, gives up nothing but the link with real objects; instead *playing*, he now *phantasies*. He builds castles in the air and creates what are called *day-dreams*. I believe that most people construct phantasies at times in their lives. This is a fact which has long been overlooked and whose importance has therefore not been sufficiently appreciated.

People's phantasies are less easy to observe than the play of children. The child, it is true, plays by himself or forms a closed psychical system with other children for the purposes of a game; but even though he may not play his game in front of the grown-ups, he does not, on the other hand, conceal it from them. The adult, on the contrary, is ashamed of his phantasies and hides them from other people. He cherishes his phantasies as his most intimate possessions, and as a rule he would rather confess his misdeeds than tell anyone his phantasies. It may come about that for that reason he believes he is the only person who invents such phantasies and has no idea that creations of this kind are widespread among other people. This difference in the behaviour of a person who plays and a person who phantasies is accounted for by the motives of these two activities, which are nevertheless adjuncts to each other.

A child's play is determined by wishes: in point of fact by a single wish-one that helps in his upbringing - the wish to be big and grown up. He is always playing at being 'grown up', and in his games he imitates what he knows about the lives of his elders. He has no reason to conceal this wish. With the adult, the case is different. On the one hand, he knows that he is expected not to go on playing or phantasying any longer, but to act in the real world; on the other hand, some of the wishes which give rise to his phantasies are of a kind which it is essential to conceal. Thus he is ashamed of his phantasies as being childish and as being unpermissible.

But, you will ask, if people make such a mystery of their phantasying, how is it that we know such a lot about it? Well, there is a class of human beings upon whom, not a god, indeed, but a stern goddess - Necessity - has allotted the task of telling what they suffer and what things give them happiness. These are the victims of nervous illness, who are obliged to tell their phantasies, among other things, to the doctor by whom they expect to be cured by mental treatment. This is our best source of knowledge, and we have since found good reason to suppose that our patients tell us nothing that we might not also hear from healthy people.

Let us now make ourselves acquainted with a few of the characteristics of phantasying. We may lay it down that a happy person never phantasies, only an unsatisfied one. The motive forces of phantasies are unsatisfied wishes, and every single phantasy is the fulfilment of a wish, a correction of unsatisfying reality. These motivating wishes vary according to the sex, character and circumstances of the person who is having the phantasy; but they fall naturally into two main groups. They are either ambitious wishes, which serve to elevate the subject's personality; or they are erotic ones. In young women the erotic wishes predominate almost exclusively, for their ambition is as a rule absorbed by erotic trends. In young men egoistic and ambitious wishes come to the fore clearly enough alongside of erotic ones. But we will not lay stress on the opposition between the two trends; we would rather emphasize the fact that they are often united. Just as, in many altar-pieces, the portrait of the donor is to be seen in a corner of the picture, so, in the majority of ambitious phantasies, we can discover in some corner or other the lady for whom the creator of the phantasy performs all his heroic deeds and at whose feet all his triumphs are laid. Here, as you see, there are strong enough motives for concealment; the well-brought-up young woman is only allowed a minimum of erotic desire, and the young man has to learn to suppress the excess of self-regard which he brings with him from the spoilt days of his childhood, so that he may find his place in a society which is full of other individuals making equally strong demands.

We must not suppose that the products of this imaginative activity - the various phantasies, castles in the air and day-dreams - are stereotyped or unalterable. On the contrary, they fit themselves in to the subject's shifting impressions of life, change with every change in his situation, and receive from every fresh active impression what might be called a 'date-mark'. The relation of a phantasy to time is in general very important. We may say that it hovers, as it were, between three times - the three moments of time which our ideation involves. Mental work is linked to some current impression, some provoking occasion in the present which has been able to arouse one of the subject's major wishes. From there it harks back to a memory of an earlier experience (usually an infantile one) in which this wish was fulfilled; and it now creates a situation relating to the future which represents a fulfilment of the wish. What it thus creates is a day-dream or phantasy, which carries about it traces of its origin from the occasion which provoked it and from the memory. Thus past, present and future are strung together, as it were, on the thread of the wish that runs through them.

A very ordinary example may serve to make what I have said clear. Let us take the case of a poor orphan boy to whom you have given the address of some employer where he may perhaps find a job. On his way there he may indulge in a day-dream appropriate to the situation from which it arises. The content of his phantasy will perhaps be something like this. He is given a job, finds favour with his new employer, makes himself indispensable in the business, is taken into his employer's family, marries the charming young daughter of the house, and then himself becomes a director of the business, first as his employer's partner and then as his successor. In this phantasy, the dreamer has regained what he possessed in his happy childhood - the protecting house, the loving parents and the first objects of his affectionate feelings. You will see from this example the way in which the wish makes use of an occasion in the present to construct, on the pattern of the past, a picture of the future.

There is a great deal more that could be said about phantasies; but I will only allude as briefly as possible to certain points. If phantasies become over-luxuriant and over-powerful, the conditions are laid for an onset of neurosis or psychosis. Phantasies, moreover, are the immediate mental precursors of the distressing symptoms complained of by our patients. Here a broad by-path branches off into pathology.

I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation of dreams.¹ Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'day-dreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed, pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of *dream-distortion*, it was no longer difficult to recognize that night-dreams are wish-fulfilments in just the same way as day-dreams - the phantasies which we all know so well.

¹ Cf. Freud, *The Interpretation of Dreams* (1900a).

So much for phantasies. And now for the creative writer. May we really attempt to compare the imaginative writer with the 'dreamer in broad daylight', and his creations with day-dreams? Here we must begin by making an initial distinction. We must separate writers who, like the ancient authors of epics and tragedies, take over their material ready-made, from writers who seem to originate their own material. We will keep to the latter kind, and, for the purposes of our comparison, we will choose not the writers most highly esteemed by the critics, but the less pretentious authors of novels, romances and short stories, who nevertheless have the widest and most eager circle of readers of both sexes. One feature above all cannot fail to strike us about the creations of these story-writers: each of them has a hero who is the centre of interest, for whom the writer tries to win our sympathy by every possible means and whom he seems to place under the protection of a special Providence. If, at the end of one chapter of my story, I leave the hero unconscious and bleeding from severe wounds, I am sure to find him at the beginning of the next being carefully nursed and on the way to recovery; and if the first volume closes with the ship he is in going down in a storm at sea, I am certain, at the opening of the second volume, to read of his miraculous rescue - a rescue without which the story could not proceed. The feeling of security with which I follow the hero through his perilous adventures is the same as the feeling with which a hero in real life throws himself into the water to save a drowning man or exposes himself to the enemy's fire in order to storm a battery. It is the true heroic feeling, which one of our best writers has expressed in an inimitable phrase: 'Nothing can happen to *me*!' It seems to me, however, that through this revealing characteristic of invulnerability we can immediately recognize His Majesty the Ego, the hero alike of every day-dream and of every story.

Other typical features of these egocentric stories point to the same kinship. The fact that all the women in the novel invariably fall in love with the hero can hardly be looked on as a portrayal of reality, but it is easily understood as a necessary constituent of a day-dream. The same is true of the fact that the other characters in the story are sharply divided into good and bad, in defiance of the variety of human characters that are to be observed in real life. The 'good' ones are the helpers, while the 'bad' ones are the enemies and rivals, of the ego which has become the hero of the story.

We are perfectly aware that very many imaginative writings are far removed from the model of the naïve day-dream; and yet I cannot suppress the suspicion that even the most extreme deviations from that model could be linked with it through an uninterrupted series of transitional cases. It has struck me that in many of what are known as 'psychological' novels only one person - once again the hero - is described from within. The author sits inside his mind, as it were, and looks at the other characters from outside. The psychological novel in general no doubt owes its special nature to the inclination of the modern writer to split up his ego, by self-observation, into many part-egos, and, in consequence, to personify the conflicting currents of his own mental life in several heroes. Certain novels, which might be described as 'eccentric', seem to stand in quite special contrast to the type of the day-dream. In these, the person who is introduced as the hero plays only a very small active part; he sees the actions and sufferings of other people pass before him like a spectator. Many of Zola's later works belong to this category. But I must point out that the psychological analysis of individuals who are not creative writers, and who diverge in some respects from the so-called norm, has shown us analogous variations of the day-dream, in which the ego contents itself with the role of spectator.

If our comparison of the imaginative writer with the day-dreamer, and of poetical creation with the day-dream, is to be of any value, it must, above all, show itself in some way or other fruitful. Let us, for instance, try to apply to these authors' works the thesis we laid down earlier concerning the relation between phantasy and the three periods of time and the wish which runs through them; and, with its help, let us try to study the connections that exist between the life of the writer and his works. No one has known, as a rule, what expectations to frame in approaching this problem; and often the connection has been thought of in much too simple terms. In the light of the insight we have gained from phantasies, we ought to expect the following state of affairs. A strong experience in the present awakens in the creative writer a memory of an earlier experience (usually belonging to his childhood) from which there now proceeds a wish which finds its fulfilment in the creative work. The work itself exhibits elements of the recent provoking occasion as well as of the old memory.

Do not be alarmed at the complexity of this formula. I suspect that in fact it will prove to be too exiguous a pattern. Nevertheless, it may contain a first approach to the true state of affairs; and, from some experiments I have made, I am inclined to think that this way of looking at creative writings may turn out not unfruitful. You will not forget that the stress it lays on childhood memories in the writer's life - a stress which may perhaps seem puzzling - is ultimately derived from the assumption that a piece of creative writing, like a day-dream, is a continuation of, and a substitute for, what was once the play of childhood.

We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the re-fashioning of ready-made and familiar material. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. In so far as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk-psychology such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the *secular dreams* of youthful humanity.

You will say that, although I have put the creative writer first in the title of my paper, I have told you far less about him than about phantasies. I am aware of that, and I must try to excuse it by pointing to the present state of our knowledge. All I have been able to do is to throw out some encouragements and suggestions which, starting from the study of phantasies, lead on to the problem of the writer's choice of his literary material. As for the other problem - by what means the creative writer achieves the emotional effects in us that are aroused by his creations - we have as yet not touched on it at all. But I should like at least to point out to you the path that leads from our discussion of phantasies to the problems of poetical effects.

You will remember how I have said that the day-dreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal day dreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret; the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic day-dreams by altering and disguising it, and he bribes us by the purely formal - that is, aesthetic - yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources. In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer's enabling us thenceforward to enjoy our own day-dreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion.

1930

HYSTERICAL PHANTASIES AND THEIR RELATION TO BISEXUALITY
(1908)

Intentionally left blank

HYSTERICAL PHANTASIES AND THEIR RELATION TO BISEXUALITY

We are all familiar with the delusional imaginings of the paranoic, which are concerned with the greatness and the sufferings of his own self and which appear in forms that are quite typical and almost monotonous. We have also become acquainted, through numerous accounts, with the strange performances with which certain perverts stage their sexual satisfaction, whether in idea or reality. Nevertheless, it may be new to some readers to hear that quite analogous psychical structures are regularly present in all the psychoneuroses, particularly in hysteria, and that these latter - which are known as hysterical phantasies - can be seen to have important connections with the causation of the neurotic symptoms.

A common source and normal prototype of all these creations of phantasy is to be found in what are called the day-dreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.¹ They occur with perhaps equal frequency in both sexes, though it seems that while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's day-dreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.² These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'day-dreams', for they give us the key to an understanding of night-dreams - in which the nucleus of the dream-formation consists of nothing else than complicated day-time phantasies of this kind that have been distorted and are misunderstood by the conscious psychical agency.³

¹ Cf. Breuer and Freud (1895), Pierre Janet (1898, 1), Havelock Ellis (1899), Freud (1900a), Pick (1896).

² Havelock Ellis (1899) is of the same opinion.

³ Cf. *The Interpretation of Dreams* (1900a).

These day-dreams are cathected with a large amount of interest; they are carefully cherished by the subject and usually concealed with a great deal of sensitivity, as though they were among the most intimate possessions of his personality. It is easy to recognize a person who is absorbed in day-dreaming in the street, however, by his sudden, as it were absent-minded, smile, his way of talking to himself, or by the hastening of his steps which marks the climax of the imagined situation. Every hysterical attack which I have been able to investigate up to the present has proved to be an involuntary irruption of day-dreams of this kind. For our observations no longer leave any room for doubt that such phantasies may be unconscious just as well as conscious; and as soon as the latter have become unconscious they may also become pathogenic - that is, they may express themselves in symptoms and attacks. In favourable circumstances, the subject can still capture an unconscious phantasy of this sort in consciousness. After I had drawn the attention of one of my patients to her phantasies, she told me that on one occasion she had suddenly found herself in tears in the street and that, rapidly considering what it was she was actually crying about, she had got hold of a phantasy to the following effect. In her imagination she had formed a tender attachment to a pianist who was well known in the town (though she was not personally acquainted with him); she had had a child by him (she was in fact childless); and he had then deserted her and her child and left them in poverty. It was at this point in her romance that she had burst into tears.

Unconscious phantasies have either been unconscious all along and have been formed in the unconscious; or - as is more often the case - they were once conscious phantasies, day-dreams, and have since been purposely forgotten and have become unconscious through 'repression'. Their content may afterwards either have remained the same or have undergone alterations, so that the present unconscious phantasies are derivatives of the once conscious ones. Now an unconscious phantasy has a very important connection with the subject's sexual life; for it is identical with the phantasy which served to give him sexual satisfaction during a period of masturbation. At that time the masturbatory act (in the widest sense of the term) was compounded of two parts. One was the evocation of a phantasy and the other some active behaviour for obtaining self-gratification at the height of the phantasy. This compound, as we know, was itself merely soldered together.¹ Originally the action was a purely auto-erotic procedure for the purpose of obtaining pleasure from some particular part of the body, which could be described as erotogenic. Later, this action became merged with a wishful idea from the sphere of object-love and served as a partial realization of the situation in which the phantasy culminated. When, subsequently, the subject renounces this type of satisfaction, composed of masturbation and phantasy, the action is given up, while the phantasy, from being conscious, becomes unconscious. If no other mode of sexual satisfaction supervenes, the subject remains abstinent; and if he does not succeed in sublimating his libido - that is, in deflecting his sexual excitation to higher aims -, the condition is now fulfilled for his unconscious phantasy to be revived and to proliferate, and, at least as regards some part of its content, to put itself into effect, with the whole force of his need for love, in the form of a pathological symptom.

¹ Cf. Freud, *Three Essays* (1905d).

In this way, unconscious phantasies are the immediate psychical precursors of a whole number of hysterical symptoms. Hysterical symptoms are nothing other than unconscious phantasies brought into view through 'conversion'; and in so far as the symptoms are somatic ones, they are often enough taken from the circle of the same sexual sensations and motor innervations as those which had originally accompanied the phantasy when it was still conscious. In this way the giving up of the habit of masturbation is in fact undone, and the purpose of the whole pathological process, which is a restoration of the original, primary sexual satisfaction, is achieved - though never completely, it is true, but always in a sort of approximation.

Anyone who studies hysteria, therefore, soon finds his interest turned away from its symptoms to the phantasies from which they proceed. The technique of psycho-analysis enables us in the first place to infer from the symptoms what those unconscious phantasies are and then to make them conscious to the patient. By this means it has been found that the content of the hysteric's unconscious phantasies corresponds completely to the situations in which satisfaction is consciously obtained by perverts; and if anyone is at a loss for examples of such situations he has only to recall the world-famous performances of the Roman Emperors, the wild excesses of which were, of course, determined only by the enormous and unrestrained power possessed by the authors of the phantasies. The delusions of paranoics are phantasies of the same nature, though they are phantasies which have become directly conscious. They rest on the sado-masochistic components of the sexual instinct, and they, too, may find their complete counterpart in certain unconscious phantasies of hysterical subjects. We also know of cases - cases which have their practical importance as well - in which hysterics do not give expression to their phantasies in the form of symptoms but as conscious realizations, and in that way devise and stage assaults, attacks or acts of sexual aggression.

This method of psycho-analytic investigation, which leads from the conspicuous symptoms to the hidden unconscious phantasies, tells us everything that can be known about the sexuality of psychoneurotics, including the fact which is to be the main subject-matter of this short preliminary publication.

Owing, probably, to the difficulties which the unconscious phantasies meet with in their endeavour to find expression, the relationship of the phantasies to the symptoms is not simple, but on the contrary, complicated in many ways.¹ As a rule - when, that is, the neurosis is fully developed and has persisted for some time - a particular symptom corresponds, not to a single unconscious phantasy, but to several such phantasies; and it does so not in an arbitrary manner but in accordance with a regular pattern. At the beginning of the illness these complications are, no doubt, not all fully developed.

For the sake of general interest I will at this point go outside the framework of this paper and interpolate a series of formulas which attempt to give a progressively fuller description of the nature of hysterical symptoms. These formulas do not contradict one another, but some represent an increasingly complete and precise approach to the facts, while others represent the application of different points of view:

(1) Hysterical symptoms are mnemonic symbols of certain operative (traumatic) impressions and experiences.

(2) Hysterical symptoms are substitutes, produced by 'conversion', for the associative return of these traumatic experiences.

(3) Hysterical symptoms are - like other psychical structures - an expression of the fulfilment of a wish.

(4) Hysterical symptoms are the realization of an unconscious phantasy which serves the fulfilment of a wish.

(5) Hysterical symptoms serve the purpose of sexual satisfaction and represent a portion of the subject's sexual life (a portion which corresponds to one of the constituents of his sexual instinct).

(6) Hysterical symptoms correspond to a return of a mode of sexual satisfaction which was a real one in infantile life and has since been repressed.

(7) Hysterical symptoms arise as a compromise between two opposite affective and instinctual impulses, of which one is attempting to bring to expression a component instinct or a constituent of the sexual constitution, and the other is attempting to suppress it.

(8) Hysterical symptoms may take over the representation of various unconscious impulses which are not sexual, but they can never be without a sexual significance.

¹ The same is true of the relation between the 'latent' dream-thoughts and the elements of the 'manifest' content of a dream. See the section of my *Interpretation of Dreams* which deals with the 'dream-work'.

Among these various definitions the seventh brings out the nature of hysterical symptoms most completely as the realization of an unconscious phantasy; and the eighth recognizes the proper significance of the sexual factor. Some of the preceding formulas lead up to these two and are contained in them.

This connection between symptoms and phantasies makes it easy to arrive from a psycho-analysis of the former at a knowledge of the components of the sexual instincts which dominate the individual, as I have demonstrated in my *Three Essays on the Theory of Sexuality*. In some cases, however, investigation by this means yields an unexpected result. It shows that there are many symptoms where the uncovering of a sexual phantasy (or of a number of phantasies, one of which, the most significant and the earliest, is of a sexual nature) is not enough to bring about a resolution of the symptoms. To resolve it one has to have *two* sexual phantasies, of which one has a masculine and the other a feminine character. Thus one of these phantasies springs from a homosexual impulse. This new finding does not alter our seventh formula. It remains true that a hysterical symptom must necessarily represent a compromise between a libidinal and a repressing impulse; but it may also represent a union of two libidinal phantasies of an opposite sexual character.

I shall refrain from giving examples in support of this thesis. I have found from experience that short analyses, condensed into extracts, can never have the convincing effect which they are designed to produce. And on the other hand, accounts of fully analysed cases must be left for another occasion.

I will therefore content myself with stating the following formula and explaining its significance:

(9) Hysterical symptoms are the expression on the one hand of a masculine unconscious sexual phantasy, and on the other hand of a feminine one.

I must expressly state that I cannot claim the same general validity for this formula as I have done for the others. As far as I can see, it applies neither to all the symptoms of a given case nor to all cases. On the contrary, it is not hard to adduce cases in which the impulses belonging to the opposite sexes have found separate symptomatic expression, so that the symptoms of heterosexuality and those of homosexuality can be as clearly distinguished from each other as the phantasies concealed behind them. Nevertheless, the condition of things stated in the ninth formula is common enough, and, when it occurs, important enough to deserve special emphasis. It seems to me to mark the highest degree of complexity to which the determination of a hysterical symptom can attain, and one may therefore only expect to find it in a neurosis which has persisted for a long time and within which a great deal of organization has taken place.¹

The bisexual nature of hysterical symptoms, which can in any event be demonstrated in numerous cases, is an interesting confirmation of my view that the postulated existence of an innate bisexual disposition in man is especially clearly visible in the analysis of psychoneurotics.² An exactly analogous state of affairs occurs in the same field when a person who is masturbating tries in his conscious phantasies to have the feelings both of the man and of the woman in the situation which he is picturing. Further counterparts are to be found in certain hysterical attacks in which the patient simultaneously plays both parts in the underlying sexual phantasy. In one case which I observed, for instance, the patient pressed her dress up against her body with one hand (as the woman), while she tried to tear it off with the other (as the man). This simultaneity of contradictory actions serves to a large extent to obscure the situation, which is otherwise so plastically portrayed in the attack, and it is thus well suited to conceal the unconscious phantasy that is at work.

¹ Sadger (1907) has recently discovered this formula independently in his own psycho-analyses. He, however, maintains that it has general validity.

² Cf. my *Three Essays*.

Hysterical Phantasies And Their Relation To Bisexuality

1939

In psycho-analytic treatment it is very important to be prepared for a symptom's having a bisexual meaning. We need not then be surprised or misled if a symptom seems to persist undiminished although we have already resolved one of its sexual meanings; for it is still being maintained by the - perhaps unsuspected - one belonging to the opposite sex. In the treatment of such cases, moreover, one may observe how the patient avails himself, during the analysis of the one sexual meaning, of the convenient possibility of constantly switching his associations, as though on to an adjoining track, into the field of the contrary meaning.

CHARACTER AND ANAL EROTISM
(1908)

Intentionally left blank

1941

CHARACTER AND ANAL EROTISM

Among those whom we try to help by our psycho-analytic efforts we often come across a type of person who is marked by the possession of a certain set of character-traits, while at the same time our attention is drawn to the behaviour in his childhood of one of his bodily functions and the organ concerned in it. I cannot say at this date what particular occasions began to give me an impression that there was some organic connection between this type of character and this behaviour of an organ, but I can assure the reader that no theoretical expectation played any part in that impression.

Accumulated experience has so much strengthened my belief in the existence of such a connection that I am venturing to make it the subject of a communication.

The people I am about to describe are noteworthy for a regular combination of the three following characteristics. They are especially *orderly*, *parsimonious* and *obstinate*. Each of these words actually covers a small group or series of interrelated character-traits. 'Orderly' covers the notion of bodily cleanliness, as well as of conscientiousness in carrying out small duties and trustworthiness. Its opposite would be 'untidy' and 'neglectful'. Parsimony may appear in the exaggerated form of avarice; and obstinacy can go over into defiance, to which rage and revengefulness are easily joined. The two latter qualities - parsimony and obstinacy are linked with each other more closely than they are with the first - with orderliness. They are, also, the more constant element of the whole complex. Yet it seems to me incontestable that all three in some way belong together.

It is easy to gather from these people's early childhood history that they took a comparatively long time to overcome their infantile *incontinentia alvi* [faecal incontinence], and that even in later childhood they suffered from isolated failures of this function. As infants, they seem to have belonged to the class who refuse to empty their bowels when they are put on the pot because they derive a subsidiary pleasure from defaecating;¹ for they tell us that even in somewhat later years they enjoyed holding back their stool, and they remember - though more readily about their brothers and sisters than about themselves - doing all sorts of unseemly things with the faeces that had been passed. From these indications we infer that such people are born with a sexual constitution in which the erotogenicity of the anal zone is exceptionally strong. But since none of these weaknesses and idiosyncracies are to be found in them once their childhood has been passed, we must conclude that the anal zone had lost its erotogenic significance in the course of development; and it is to be suspected that the regularity with which this triad of properties is present in their character may be brought into relation with the disappearance of their anal erotism.

I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my *Three Essays on the Theory of Sexuality* in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.²

¹ Cf. Freud, *Three Essays on the Theory of Sexuality* (1905d).

² Since it is precisely the remarks in my *Three Essays on the Theory of Sexuality* about the anal erotism of infants that have particularly scandalized uncomprehending readers, I venture at this point to interpolate an observation for which I have to thank a very intelligent patient. 'A friend of mine', he told me, 'who has read your *Three Essays on the Theory of Sexuality*, was talking about the book. He entirely agreed with it, but there was one passage, which - though of course he accepted and understood its meaning like that of the rest - struck him as so grotesque and comic that he sat down and laughed over it for a quarter of an hour. This passage ran: "One of the clearest signs of subsequent eccentricity or nervousness is to be seen when a baby obstinately refuses to empty his bowels when he is put on the pot - that is, when his nurse wants him to - and holds back that function till he himself chooses to exercise it. He is naturally not concerned with dirtying the bed, he is only anxious not to miss the subsidiary pleasure attached to defaecating." The picture of this baby sitting on the pot and deliberating whether he would put up with a restriction of this kind upon his personal freedom of will, and feeling anxious, too, not to miss the pleasure attached to defaecating, - this caused my friend the most intense amusement. About twenty minutes afterwards, as we were having some cocoa, he suddenly remarked without any preliminary: "I say, seeing the cocoa in front of me has suddenly made me think of an idea that I always had when I was a child. I used always to pretend to myself that I was the cocoa-manufacturer Van Houten" (he pronounced the name Van "Hauten") "and that I possessed a great secret for the manufacture of this cocoa. Everybody was trying to get hold of this secret that was a boon to humanity but I kept it carefully to myself. I don't know why I should have hit specially upon Van Houten. Probably his advertisements impressed me more than any others." Laughing, and without thinking at the time that my words had any deep meaning, I said: "Wann haut'n die Mutter?" ['When does mother smack?'] The first two words in the German phrase are pronounced exactly like 'Van Houten'.] It was only later that I realized that my pun in fact contained the key to the whole of my friend's sudden childhood recollection, and I then recognized it as a brilliant example of a screen-phantasy. My friend's phantasy, while keeping to the situation, actually involved (the nutritional process) and making use of phonetic associations ("Kakao" ['cocoa' - 'Kaka' is the common German nursery word for 'faeces'] and "Wann haut'n"), pacified his sense of guilt by making a complete reversal in the content of his recollection: there was a displacement from the back of the body to the front, excreting food became taking food in, and something that was shameful and had to be concealed became a secret that was a boon to humanity. I was interested to see how, only a quarter of an hour after my friend had fended the phantasy off (though, it is true, in the comparatively mild form of raising an objection on formal grounds) - he was, quite involuntarily, presented with the most convincing evidence by his own unconscious.'

The intrinsic necessity for this connection is not clear, of course, even to myself. But I can make some suggestions which may help towards an understanding of it. Cleanliness, orderliness and trustworthiness give exactly the impression of a reaction-formation against an interest in what is unclean and disturbing and should not be part of the body. ('Dirt is matter in the wrong place.')

¹ To relate obstinacy to an interest in defaecation would seem no easy task; but it should be remembered that even babies can show self-will about parting with their stool, as we have seen above, and that it is a general practice in children's upbringing to administer painful stimuli to the skin of the buttocks which is linked up with the erotogenic anal zone - in order to break their obstinacy and make them submissive. An invitation to a caress of the anal zone is still used to-day, as it was in ancient times, to express defiance or defiant scorn, and thus in reality signifies an act of tenderness that has been overtaken by repression. An exposure of the buttocks represents a softening down of this spoken invitation into a gesture; in Goethe's *Götz von Berlichingen* both words and gesture are introduced at the most appropriate point as an expression of defiance.

The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psycho-analysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'.² But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life.³ We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats [*Dukatenscheisser*]'.⁴ Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = *ilu manman*)⁵. Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.

¹ [In English in the original.]

² [The English 'filthy' as well as the German '*filzig*' appears in the original.]

³ Compare hysterical possession and demoniac epidemics.

⁴ [A term vulgarly used for a wealthy spendthrift.]

⁵ Cf. Jeremias (1904, 115n.). "Mamon" ("Mammon") is "Manman" in Babylonian and is another name for Nergal, the God of the Underworld. According to Oriental mythology, which has passed over into popular legends and fairy tales, gold is the excrement of Hell.'

It is possible that the contrast between the most precious substance known to men and the most worthless, which they reject as waste matter ('refuse'¹), has led to this specific identification of gold with faeces.

Yet another circumstance facilitates this equation in neurotic thought. The original erotic interest in defaecation is, as we know, destined to be extinguished in later years. In those years the interest in money makes its appearance as a new interest which had been absent in childhood. This makes it easier for the earlier impulsion, which is in process of losing its aim, to be carried over to the newly emerging aim.

If there is any basis in fact for the relation posited here between anal erotism and this triad of character-traits, one may expect to find no very marked degree of 'anal character' in people who have retained the anal zone's erotogenic character in adult life, as happens, for instance, with certain homosexuals. Unless I am much mistaken, the evidence of experience tallies quite well on the whole with this inference.

We ought in general to consider whether other character complexes, too, do not exhibit a connection with the excitations of particular erotogenic zones. At present I only know of the intense 'burning' ambition of people who earlier suffered from enuresis. We can at any rate lay down a formula for the way in which character in its final shape is formed out of the constituent instincts: the permanent character-traits are either unchanged prolongations of the original instincts, or sublimations of those instincts, or reaction-formations against them.

‘CIVILIZED’ SEXUAL MORALITY AND MODERN NERVOUS ILLNESS
(1908)

Intentionally left blank

1947

'CIVILIZED' SEXUAL MORALITY AND MODERN NERVOUS ILLNESS

In his recently published book, *Sexual Ethics*, Von Ehrenfels (1907) dwells on the difference between 'natural' and 'civilized' sexual morality. By natural sexual morality we are to understand, according to him, a sexual morality under whose dominance a human stock is able to remain in lasting possession of health and efficiency, while civilized sexual morality is a sexual morality obedience to which, on the other hand, spurs men on to intense and productive cultural activity. This contrast, he thinks, is best illustrated by comparing the innate character of a people with their cultural attainments. I may refer the reader to Von Ehrenfels's own work for a more extensive consideration of this significant line of thought, and I shall extract from it here only as much as I need as a starting-point for my own contribution to the subject.

It is not difficult to suppose that under the domination of a civilized sexual morality the health and efficiency of single individuals may be liable to impairment and that ultimately this injury to them, caused by the sacrifices imposed on them, may reach such a pitch that, by this indirect path, the cultural aim in view will be endangered as well. And Von Ehrenfels does in fact attribute a number of ill-effects to the sexual morality which dominates our Western society to-day, ill-effects for which he is obliged to make that morality responsible; and, although he fully acknowledges its high aptitude for the furtherance of civilization, he is led to convict it of standing in need of reform. In his view, what is characteristic of the civilized sexual morality that dominates us is that the demands made on women are carried over to the sexual life of men and that all sexual intercourse is prohibited except in monogamous marriage. Nevertheless, consideration of the natural difference between the sexes makes it necessary to visit men's lapses with less severity and thus in fact to admit a *double* morality for them. But a society which accepts this double morality cannot carry 'the love of truth, honesty and humanity' (Von Ehrenfels, *ibid.* 32 ff.) beyond a definite and narrow limit, and is bound to induce in its members concealment of the truth, false optimism, self-deception and deception of others. And civilized sexual morality has still worse effects, for, by glorifying monogamy, it cripples the factor of *selection by virility* - the factor whose influence alone can bring about an improvement of the individual's innate constitution, since in civilized peoples *selection by vitality* has been reduced to a minimum by humanity and hygiene (*ibid.*, 35).

Among the damaging effects which are here laid at the door of civilized sexual morality, the physician will miss a particular one whose significance will be discussed in detail in the present paper. I refer to the increase traceable to it of modern nervous illness - of the nervous illness, that is, which is rapidly spreading in our present-day society. Occasionally a nervous patient will himself draw the doctor's attention to the part played in the causation of his complaint by the opposition between his constitution and the demands of civilization and will say: 'In our family we've all become neurotic because we wanted to be something better than what, with our origin, we are capable of being.' Often, too, the physician finds food for thought in observing that those who succumb to nervous illness are precisely the offspring of fathers who, having been born of rough but vigorous families, living in simple, healthy, country conditions, had successfully established themselves in the metropolis, and in a short space of time had brought their children to a high level of culture. But, above all, nerve specialists themselves have loudly proclaimed the connection between 'increasing nervous illness' and modern civilized life. The grounds to which they attribute this connection will be shown by a few extracts from statements that have been made by some eminent observers.

W. Erb (1893): 'The original question, then, is whether the causes of nervous illness that have been put before you are present in modern life to such a heightened degree as to account for a marked increase in that form of illness. The question can be answered without hesitation in the affirmative, as a cursory glance at our present-day existence and its features will show.

'This is already clearly demonstrated by a number of general facts. The extraordinary achievements of modern times, the discoveries and inventions in every sphere, the maintenance of progress in the face of increasing competition - these things have only been gained, and can only be held, by great mental effort. The demands made on the efficiency of the individual in the struggle for existence have greatly increased and it is only by putting out all his mental powers that he can meet them. At the same time, the individual's needs and his demands for the enjoyments of life have increased in all classes; unprecedented luxury has spread to strata of the population who were formerly quite untouched by it; irreligion, discontent and covetousness have grown up in wide social spheres. The immense extension of communications which has been brought about by the network of telegraphs and telephones that encircle the world has completely altered the conditions of trade and commerce. All is hurry and agitation; night is used for travel, day for business, even 'holiday trips' have become a strain on the nervous system. Important political, industrial and financial crises carry excitement into far wider circles of people than they used to do; political life is engaged in quite generally; political, religious and social struggles, party-politics, electioneering, and the enormous spread of trade-unionism inflame tempers, place an ever greater strain on the mind, and encroach upon the hours for recreation, sleep and rest. City life is constantly becoming more sophisticated and more restless. The exhausted nerves seek recuperation in increased stimulation and in highly-spiced pleasures, only to become more exhausted than before. Modern literature is predominantly concerned with the most questionable problems which stir up all the passions, and which encourage sensuality and a craving for pleasure, and contempt for every fundamental ethical principle and every ideal. It brings before the reader's mind pathological figures and problems concerned with psychopathic sexuality, and revolutionary and other subjects. Our ears are excited and overstimulated by large doses of noisy and insistent music. The theatres captivate all our senses with their exciting performances. The plastic arts, too, turn by preference to what is repellent, ugly and suggestive, and do not hesitate to set before our eyes with revolting fidelity the most horrible sights that reality has to offer.

'This general description is already enough to indicate a number of dangers presented by the evolution of our modern civilization. Let me now fill in the picture with a few details.'

Binswanger (1896): 'Neurasthenia in particular has been described as an essentially modern disorder, and Beard, to whom we are indebted for a first comprehensive account of it believed that he had discovered a new nervous disease which had developed specifically on American soil. This supposition was of course a mistaken one; nevertheless, the fact that it was an *American* physician who was first able to grasp and describe the peculiar features of this illness, as the fruit of a wide experience, indicates, no doubt, the close connections which exist between it and modern life, with its unbridled pursuit of money and possessions, and its immense advances in the field of technology which have rendered illusory every obstacle, whether temporal or spatial, to our means of intercommunication.'

Von Krafft-Ebing (1895): 'The mode of life of countless civilized people exhibits nowadays an abundance of anti-hygienic factors which make it easy to understand the fateful increase of nervous illness; for those injurious factors take effect first and foremost on the brain. In the course of the last decades changes have taken place in the political and social - and especially in the mercantile, industrial and agricultural - conditions of civilized nations which have brought about great changes in people's occupations, social position and property, and this at the cost of the nervous system, which is called upon to meet the increased social and economic demands by a greater expenditure of energy, often with quite inadequate opportunity for recuperation.'

The fault I have to find with these and many other similarly-worded opinions is not that they are mistaken but that they prove insufficient to explain the details in the picture of nervous disturbances and that they leave out of account precisely the most important of the aetiological factors involved. If we disregard the vaguer ways of being 'nervous' and consider the specific forms of nervous illness, we shall find that the injurious influence of civilization reduces itself in the main to the harmful suppression of the sexual life of civilized peoples (or classes) through the 'civilized' sexual morality prevalent in them.

I have tried to bring forward the evidence for this assertion in a number of technical papers.¹ I cannot repeat it here. I will, however, quote the most important of the arguments arising from my investigations.

Careful clinical observation allows us to distinguish two groups of nervous disorders: the *neuroses* proper and the *psychoneuroses*. In the former the disturbances (the symptoms), whether they show their effects in somatic or mental functioning, appear to be of a *toxic* nature. They behave exactly like the phenomena accompanying an excess or a deprivation of certain nerve poisons. These neuroses - which are commonly grouped together as 'neurasthenia' - can be induced by certain injurious influences in sexual life, without any hereditary taint being necessarily present; indeed, the form taken by the disease corresponds to the nature of these noxae, so that often enough the particular sexual aetiology can at once be deduced from the clinical picture. There is a total absence, on the other hand, of any such regular correspondence between the form of a nervous illness and the other injurious influences of civilization which are blamed by the authorities. We may, therefore, regard the sexual factor as the essential one in the causation of the neuroses proper.

¹ See my collection of short papers on the theory of the neuroses (1906).

With the psychoneuroses, the influence of heredity is more marked and the causation less transparent. A peculiar method of investigation known as psycho-analysis has, however, enabled us to recognize that the symptoms of these disorders (hysteria, obsessional neurosis, etc.) are *psychogenic* and depend upon the operation of unconscious (repressed) ideational complexes. This same method has also taught us what those unconscious complexes are and has shown that, quite generally speaking, they have a sexual content. They spring from the sexual needs of people who are unsatisfied and represent for them a kind of substitutive satisfaction. We must therefore view all factors which impair sexual life, suppress its activity or distort its aims as being pathogenic factors in the psychoneuroses as well.

The value of a theoretical distinction between toxic and psychogenic neuroses is, of course, not diminished by the fact that, in most people suffering from nervous illness, disturbances arising from both sources are to be observed.

The reader who is prepared to agree with me in looking for the aetiology of nervous illness pre-eminently in influences which damage sexual life, will also be ready to follow the further discussion, which is intended to set the theme of increasing nervous illness in a wider context.

Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

¹ [In English in the original]

The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for *sublimation*. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

Further prospects are opened up when we take into consideration the fact that in man the sexual instinct does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure.¹ It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of *auto-erotism*, and the child's upbringing has, in our view, the task of restricting it, because to linger in it would make the sexual instinct uncontrollable and unserviceable later on. The development of the sexual instinct then proceeds from auto-erotism to object-love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation which is provided by the subject's own body is inhibited as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the *perverse* elements of sexual excitation.

If this evolution of the sexual instinct is borne in mind, three stages of civilization can be distinguished: a first one, in which the sexual instinct may be freely exercised without regard to the aims of reproduction; a second, in which all of the sexual instinct is suppressed except what serves the aims of reproduction; and a third, in which only *legitimate* reproduction is allowed as a sexual aim. This third stage is reflected in our present-day 'civilized' sexual morality.

If we take the second of these stages as an average, we must point out that a number of people are, on account of their organization, not equal to meeting its demands. In whole classes of individuals the development of the sexual instinct, as we have described it above, from auto-erotism to object-love with its aim of uniting the genitals, has not been carried out correctly and sufficiently fully. As a result of these disturbances of development two kinds of harmful deviation from normal sexuality - that is, sexuality which is serviceable to civilization - come about; and the relation between these two is almost that of positive and negative.¹

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhabitable) there are the different varieties *perverts*, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the *homosexuals* or *inverts*, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

¹ Cf. my *Three Essays on the Theory of Sexuality* (1905d).

More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual instinct which by absolute standards is strong or comparatively weak. In the latter case - where the sexual instinct is in general weak - perverses succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual instinct, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.

Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is *apparent* and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the 'negative' of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of 'repression', as do the positive perversions.

¹ Cf. my introductory remarks above.

Experience teaches us that for most people there is a limit beyond which their constitution cannot comply with the demands of civilization. All who wish to be more noble-minded than their constitution allows fall victims to neurosis; they would have been more healthy if it could have been possible for them to be less good. The discovery that perversions and neuroses stand in the relation of positive and negative is often unmistakably confirmed by observations made on the members of one generation of a family. Quite frequently a brother is a sexual pervert, while his sister, who, being a woman, possesses a weaker sexual instinct, is a neurotic whose symptoms express the same inclinations as the perversions of her sexually more active brother. And correspondingly, in many families the men are healthy, but from a social point of view immoral to an undesirable degree, while the women are high-minded and over-refined, but severely neurotic.

It is one of the obvious social injustices that the standard of civilization should demand from everyone the same conduct of sexual life - conduct which can be followed without any difficulty by some people, thanks to their organization, but which imposes the heaviest psychical sacrifices on others; though, indeed, the injustice is as a rule wiped out by disobedience to the injunctions of morality.

These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as pervers, and a number of others, who make efforts not to be pervers whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.

Let us now try to answer three questions that arise here:

- (1) What is the task that is set to the individual by the requirements of the third stage of civilization?
- (2) Can the legitimate sexual satisfaction that is permissible offer acceptable compensation for the renunciation of all other satisfactions?
- (3) In what relation do the possible injurious effects of this renunciation stand to its exploitation in the cultural field?

The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives. (Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it.

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.) But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful instinct, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, 'steel' the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young *savant* is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.

The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

The sexual behaviour of a human being often *lays down the pattern* for all his other modes of reacting to life. If a man is energetic in winning the object of his love, we are confident that he will pursue his other aims with an equally unswerving energy; but if, for all sorts of reasons, he refrains from satisfying his strong sexual instincts, his behaviour will be conciliatory and resigned rather than vigorous in other spheres of life as well. A special application of this proposition that sexual life lays down the pattern for the exercise of other functions can easily be recognized in the female sex as a whole. Their upbringing forbids their concerning themselves intellectually with sexual problems though they nevertheless feel extremely curious about them, and frightens them by condemning such curiosity as unwomanly and a sign of a sinful disposition. In this way they are scared away from *any* form of thinking, and knowledge loses its value for them. The prohibition of thought extends beyond the sexual field, partly through unavoidable association, partly automatically, like the prohibition of thought about religion among men, or the prohibition of thought about loyalty among faithful subjects. I do not believe that women's 'physiological feeble-mindedness' is to be explained by a biological opposition between intellectual work and sexual activity, as Moebius has asserted in a work which has been widely disputed. I think that the undoubted intellectual inferiority of so many women can rather be traced back to the inhibition of thought necessitated by sexual suppression.

In considering the question of abstinence, the distinction is not nearly strictly enough made between two forms of it - namely abstention from any sexual activity whatever and abstention from sexual intercourse with the opposite sex. Many people who boast of succeeding in being abstinent have only been able to do so with the help of masturbation and similar satisfactions which are linked with the auto-erotic sexual activities of early childhood. But precisely because of this connection such substitutive means of sexual satisfaction are by no means harmless; they predispose to the numerous varieties of neuroses and psychoses which are conditional on an involution of sexual life to its infantile forms. Masturbation, moreover, is far from meeting the ideal demands of civilized sexual morality, and consequently drives young people into the same conflicts with the ideals of education which they hoped to escape by abstinence. Furthermore, it vitiates the character through *indulgence*, and this in more than one way. In the first place, it teaches people to achieve important aims without taking trouble and by easy paths instead of through an energetic exertion of force - that is, it follows the principle that *sexuality lays down the pattern* of behaviour; secondly, in the phantasies that accompany satisfaction the sexual object is raised to a degree of excellence which is not easily found again in reality. A witty writer (Karl Kraus in the Vienna paper *Die Fackel*) once expressed this truth in reverse by cynically remarking: 'Copulation is no more than an unsatisfying substitute for masturbation.'

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsions. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.

1965

ON THE SEXUAL THEORIES OF CHILDREN

The material on which the following synthesis is based is derived from several sources. Firstly, from the direct observation of what children say and do; secondly, from what adult neurotics consciously remember from their childhood and relate during psycho-analytic treatment; and thirdly, from the inferences and constructions, and from the unconscious memories translated into conscious material, which result from the psycho-analysis of neurotics.

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

I cannot guarantee the completeness of my results, but I can answer for the care taken in arriving at them.

There remains a difficult question to decide. How far may one assume that what is here reported of children generally is true of all children - that is, of every particular child? Pressure of education and varying intensity of the sexual instinct certainly make great individual variations in the sexual behaviour of children possible, and, above all, influence the date at which a child's sexual interest appears. For this reason, I have not divided my presentation of the material according to the successive epochs of childhood, but have combined into a single account things that come into play in different children sometimes earlier and sometimes later. It is my conviction that no child - none, at least, who is mentally normal and still less one who is intellectually gifted - can avoid being occupied with the problems of sex in the years *before* puberty.

I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worth while to collect the childhood memories of *healthy* adults as well.

In consequence of unfavourable circumstances, both of an external and an internal nature, the following observations apply chiefly to the sexual development of one sex only - that is, of males. The value of a compilation such as I am attempting here need not, however, be a purely descriptive one. A knowledge of infantile sexual theories in the shapes they assume in the thoughts of children can be of interest in various ways - even, surprisingly enough, for the elucidation of myths and fairy tales. They are indispensable, moreover, for an understanding of the neuroses themselves; for in them these childish theories are still operative and acquire a determining influence upon the form taken by the symptoms.

If we could divest ourselves of our corporeal existence, and could view the things of this earth with a fresh eye as purely thinking beings, from another planet for instance, nothing perhaps would strike our attention more forcibly than the fact of the existence of two sexes among human beings, who, though so much alike in other respects, yet mark the difference between them with such obvious external signs. But it does not seem that children choose this fundamental fact in the same way as the starting-point of their researches into sexual problems. Since they have known a father and mother as far back as they can remember in life, they accept their existence as a reality which needs no further enquiry, and a boy has the same attitude towards a little sister from whom he is separated by only a slight difference of age of one or two years. A child's desire for knowledge on this point does not in fact awaken spontaneously, prompted perhaps by some inborn need for established causes; it is aroused under the goad of the self-seeking instincts that dominate him, when - perhaps after the end of his second year - he is confronted with the arrival of a new baby. And a child whose own nursery has received no such addition is able, from observations made in other homes, to put himself in the same situation. The loss of his parents' care, which he actually experiences or justly fears, and the presentiment that from now on he must for evermore share all his possessions with the newcomer, have the effect of awakening his emotions and sharpening his capacities for thought. The elder child expresses unconcealed hostility towards his rival, which finds vent in unfriendly criticisms of it, in wishes that 'the stork should take it away again' and occasionally even in small attacks upon the creature lying helpless in the cradle. A wider difference in age usually softens the expression of this primary hostility. In the same way, at a rather later age, if no small brother or sister has appeared, the child's wish for a playmate, such as he has seen in other families, may gain the upper hand.

At the instigation of these feelings and worries, the child now comes to be occupied with the first, grand problem of life and asks himself the question: '*Where do babies come from?*' - a question which, there can be no doubt, first ran: 'Where did this particular, intruding baby come from?' We seem to hear the echoes of this first riddle in innumerable riddles of myth and legend. The question itself is, like all research, the product of a vital exigency, as though thinking were entrusted with the task of preventing the recurrence of such dreaded events. Let us assume, however, that the child's thinking soon becomes independent of this instigation, and henceforward goes on operating as a self-sustained instinct for research. Where a child is not already too much intimidated, he sooner or later adopts the direct method of demanding an answer from his parents or those in charge of him, who are in his eyes the source of all knowledge. This method, however, fails. The child receives either evasive answers or a rebuke for his curiosity, or he is dismissed with the mythologically significant piece of information which, in German countries, runs: 'The stork brings the babies; it fetches them out of the water.' I have reason to believe that far more children than their parents suspect are dissatisfied with this solution and meet it with energetic doubts, which, however, they do not always openly admit. I know of a three-year-old boy who, after receiving this piece of enlightenment, disappeared - to the terror of his nurse. He was found at the edge of the big pond adjoining the country house, to which he had hurried in order to see the babies in the water. I also know of another boy who could only allow his disbelief to find expression in a hesitant remark that he knew better, that it was not a stork that brought babies but a heron. It seems to me to follow from a great deal of information I have received that children refuse to believe the stork theory and that from the time of this first deception and rebuff they nourish a distrust of adults and have a suspicion of there being something forbidden which is being withheld from them by the 'grown-ups', and that they consequently hide their further researches under a cloak of secrecy. With this, however, the child also experiences the first occasion for a 'psychical conflict', in that views for which he feels an instinctual kind of preference, but which are not 'right' in the eyes of the grown-ups, come into opposition with other views, which are supported by the authority of the grown-ups without being acceptable to him himself. Such a psychical conflict may soon turn into a 'psychical dissociation'. The set of views which are bound up with being 'good', but also with a cessation of reflection, become the dominant and conscious views; while the other set, for which the child's work of research has meanwhile obtained fresh evidence, but which are not supposed to count, become the suppressed and 'unconscious' ones. The nuclear complex of a neurosis is in this way brought into being.

Recently, the analysis of a five-year-old boy, which his father undertook and which he has handed over to me for publication, has given me irrefutable proof of the correctness of a view towards which the psycho-analysis of adults had long been leading me. I now know that the change which takes place in the mother during pregnancy does not escape the child's sharp eyes and that he is very well able before long to establish the true connection between the increase in his mother's stoutness and the appearance of the baby. In the case just mentioned the boy was three and a half years old when his sister was born and four and three quarters when he showed his better knowledge by the most unmistakable allusions. This precocious discovery, however, is always kept secret, and later, in conformity with the further vicissitudes of the child's sexual researches, it is repressed and forgotten.

The 'stork fable', therefore, is not one of the sexual theories of children. On the contrary, it is the child's observation of animals, who hide so little of their sexual life and to whom he feels so closely akin, that strengthens his disbelief in it. With his knowledge, independently obtained, that babies grow inside the mother's body, he would be on the right road to solving the problem on which he first tries out his powers of thinking. But this further progress is inhibited by a piece of ignorance which cannot be made good and by false theories which the state of his own sexuality imposes on him.

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual instinct which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child's psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.

The first of these theories starts out from the neglect of the differences between the sexes on which I laid stress at the beginning of this paper as being characteristic of children. It consists in *attributing to everyone, including females, the possession of a penis*, such as the boy knows from his own body. It is precisely in what we must regard as the 'normal' sexual constitution that already in childhood the penis is the leading erotogenic zone and the chief auto-erotic sexual object; and the boy's estimate of its value is logically reflected in his inability to imagine a person like himself who is without this essential constituent. When a small boy sees his little sister's genitals, what he says shows that his prejudice is already strong enough to falsify his perception. He does not comment on the absence of a penis, but *invariably* says, as though by way of consolation and to put things right: 'Her ---'s still quite small. But when she gets bigger it'll grow all right.' The idea of a woman with a penis returns in later life, in the dreams of adults: the dreamer, in a state of nocturnal sexual excitation, will throw a woman down, strip her and prepare for intercourse - and then, in place of the female genitals, he beholds a well-developed penis and breaks off the dream and the excitation. The numerous hermaphrodites of classical antiquity faithfully reproduce this idea, universally held in childhood; one may observe that to most normal people they cause no offence, while the real hermaphroditic formations of the genitals which are permitted to occur by Nature nearly always excite the greatest abhorrence.

If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.

It is easy to observe that little girls fully share their brother's opinion of it. They develop a great interest in that part of the boy's body. But this interest promptly falls under the sway of envy. They feel themselves unfairly treated. They make attempts to micturate in the posture that is made possible for boys by their possessing a big penis; and when a girl declares that 'she would rather be a boy', we know what deficiency her wish is intended to put right.

If children could follow the hints given by the excitation of the penis they would get a little nearer to the solution of their problem. That the baby grows inside the mother's body is obviously not a sufficient explanation. How does it get inside? What starts its development? That the father has something to do with it seems likely; he says that the baby is *his* baby as well.¹ Again, the penis certainly has a share, too, in these mysterious happenings; the excitation in it which accompanies all these activities of the child's thoughts bears witness to this. Attached to this excitation are impulsions which the child cannot account for - obscure urges to do something violent, to press in, to knock to pieces, to tear open a hole somewhere. But when the child thus seems to be well on the way to postulating the existence of the vagina and to concluding that an incursion of this kind by his father's penis into his mother is the act by means of which the baby is created in his mother's body - at this juncture his enquiry is broken off in helpless perplexity. For standing in its way is his theory that his mother possesses a penis just as a man does, and the existence of the cavity which receives the penis remains undiscovered by him. It is not hard to guess that the lack of success of his intellectual efforts makes it easier for him to reject and forget them. This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution of problems, and the first failure has a crippling effect on the child's whole future.

¹ Cf. the 'Analysis of a Five-Year-Old Boy' (1909b).

Their ignorance of the vagina also makes it possible for children to believe in the second of their sexual theories. If the baby grows in the mother's body and is then removed from it, this can only happen along the one possible pathway -the anal aperture. *The baby must be evacuated like a piece of excrement, like a stool.* When, in later childhood, the same question is the subject of solitary reflection or of a discussion between two children, the explanations probably arrived at are that the baby emerges from the navel, which comes open, or that the abdomen is slit up and the baby taken out - which was what happened to the wolf in the story of Little Red Riding-Hood. These theories are expressed aloud and also consciously remembered later on; they no longer contain anything objectionable. These same children have by then completely forgotten that in earlier years they believed in another theory of birth, which is now obstructed by the repression of the anal sexual components that has meanwhile occurred. At that time a motion was something which could be talked about in the nursery without shame. The child was still not so distant from his constitutional coprophilic inclinations. There was nothing degraded about coming into the world like a heap of faeces, which had not yet been condemned by feelings of disgust. The cloacal theory, which, after all, is valid for so many animals, was the most natural theory, and it alone could obtrude upon the child as being a probable one.

This being so, however, it was only logical that the child should refuse to grant women the painful prerogative of giving birth to children. If babies are born through the anus, then a man can give birth just as well as a woman. It is therefore possible for a boy to imagine that he, too, has children of his own, without there being any need to accuse him on that account of having feminine inclinations. He is merely giving evidence in this of the anal erotism which is still alive in him.

If the cloacal theory of birth is preserved in consciousness during later years of childhood, as occasionally happens, it is accompanied too by a solution - no longer, it is true, a primary one - of the problem of the origin of babies. Here it is like being in a fairy story; one eats some particular thing and gets a child from it. This infantile theory of birth is revived in cases of insanity. A manic woman, for instance, will lead the visiting doctor to a little heap of faeces which she has deposited in a corner of her cell, and say to him with a laugh: 'That's the baby I had to-day.'

The third of the typical sexual theories arises in children if, through some chance domestic occurrence, they become witnesses of sexual intercourse between their parents. Their perceptions of what is happening are bound, however, to be only very incomplete. Whatever detail it may be that comes under their observation - whether it is the relative positions of the two people, or the noises they make, or some accessory circumstance - children arrive in every case at the same conclusion. They adopt what may be called a *sadistic view of coition*. They see it as something that the stronger participant is forcibly inflicting on the weaker, and they (especially boys) compare it to the romping familiar to them from their childish experience - romping which, incidentally, is not without a dash of sexual excitation. I have not been able to ascertain that children recognize this behaviour which they have witnessed between their parents as the missing link needed for solving the problem of babies; it appears more often that the connection is overlooked by them for the very reason that they have interpreted the act of love as an act of violence. But this view of it itself gives an impression of being a return of the obscure impulse towards cruel behaviour which became attached to the excitations of the child's penis when he first began to think about the problem of where babies came from. The possibility, too, cannot be excluded that this premature sadistic impulse, which might so nearly have led to the discovery of coition, itself first emerged under the influence of extremely obscure memories of parental intercourse, for which the child had obtained the material - though at the time he made no use of it - while he was still in his first years and was sharing his parents' bedroom.¹

¹ Restif de la Bretonne, in his autobiographical work *Monsieur Nocholas* (1794), tells a story of an impression he received at the age of four, which confirms this sadistic misunderstanding of coitus.

The sadistic theory of coitus which, taken in isolation, is misleading where it might have provided confirmatory evidence, is, once again, the expression of one of the innate components of the sexual instinct, any of which may be strongly marked to a greater or lesser degree in each particular child. For this reason the theory is correct up to a certain point; it has in part divined the nature of the sexual act and the 'sex-battle' that precedes it. Not infrequently, too, the child is in a position to support this view by accidental observations which he understands in part correctly, but also in part incorrectly and indeed in a reversed sense. In many marriages the wife does in fact recoil from her husband's embraces, which bring her no pleasure, but the risk of a fresh pregnancy. And so the child who is believed to be asleep (or who is pretending to be asleep) may receive an impression from his mother which he can only interpret as meaning that she is defending herself against an act of violence. At other times the whole marriage offers an observant child the spectacle of an unceasing quarrel, expressed in loud words and unfriendly gestures; so that he need not be surprised if the quarrel is carried on at night as well, and finally settled by the same method which he himself is accustomed to use in his relations with his brothers and sisters or playmates.

Moreover, if the child discovers spots of blood in his mother's bed or on her underclothes, he regards it as a confirmation of his view. It proves to him that his father has made another similar assault on his mother during the night (whereas we should rather take the fresh spots of blood to mean that there had been a temporary cessation of sexual intercourse). Much of the otherwise inexplicable 'horror of blood' shown by neurotics finds its explanation from this connection. Once again, however, the child's mistake contains a fragment of truth. For in certain familiar circumstances a trace of blood is in fact judged as a sign that sexual intercourse has been begun.

A question connected somewhat indirectly with the insoluble problem of where babies come from also engages the child - the question as to the nature and content of the state called 'being married'; and he answers the question differently according as his chance perceptions in relation to his parents have coincided with instincts of his own which are still pleasurable coloured. All that these answers seem to have in common is that the child promises himself pleasurable satisfaction from being married and supposes that it involves a disregard of modesty. The notion I have most frequently met with is that *each of the married couple urinate in front of the other*. A variation of this, which sounds as if it was meant to indicate a greater knowledge symbolically, is that *the man urinates into the woman's chamber-pot*. In other instances the meaning of marriage is supposed to be that *the two people show their behinds to each other* (without being ashamed). In one case, in which education had succeeded in postponing sexual knowledge especially late, a fourteen-year-old girl, who had already begun to menstruate, arrived from the books she had read at the idea that being married consisted in a 'mixing of blood'; and since her own sister had not yet started her periods, the lustful girl made an assault on a female visitor who had confessed that she was just then menstruating, so as to force her to take part in this 'blood mixing'.

Childhood opinions about the nature of marriage, which are not seldom retained by conscious memory, have great significance for the symptomatology of later neurotic illness. At first they find expression in children's games in which each child does with another whatever it is that in his view constitutes being married; and then, later on, the wish to be married may choose the infantile form of expression and so make its appearance in a phobia which is at first sight unrecognizable, or in some corresponding symptom.¹

These seem to be the most important of the typical sexual theories that children produce spontaneously in early childhood, under the sole influence of the components of the sexual instinct. I know that I have not succeeded in making my material complete or in establishing an unbroken connection between it and the rest of infantile life. But I may add one or two supplementary observations, whose absence would otherwise be noticed by any well-informed person. Thus, for instance, there is the significant theory that a baby is got by a kiss - a theory which obviously betrays the predominance of the erotogenic zone of the mouth. In my experience this theory is exclusively feminine and is sometimes found to be pathogenic in girls whose sexual researches have been subjected to exceedingly strong inhibitions in childhood. Again, through an accidental observation, one of my women patients happened upon the theory of the 'couvade', which, as is well known, is a general custom among some races and is probably intended to contradict the doubts as to paternity which can never be entirely overcome. A rather eccentric uncle of this patient's stayed at home for days after the birth of his child and received visitors in his dressing-gown, from which she concluded that both parents took part in the birth of their children and had to go to bed.

¹ The games that are most significant for subsequent neuroses are playing at 'doctor' and at 'father and mother'.

In about their tenth or eleventh year, children get to hear about sexual matters. A child who has grown up in a comparatively uninhibited social atmosphere, or who has found better opportunities for observation, tells other children what he knows, because this makes him feel mature and superior. What children learn in this way is mostly correct - that is, the existence of the vagina and its purpose is revealed to them; but otherwise the explanations they get from one another are not infrequently mixed with false ideas and burdened with remains of the older infantile sexual theories. They are scarcely ever complete or sufficient to solve the primordial problem. Just as formerly it was ignorance of the vagina which prevented the whole process from being understood, so now is it ignorance of the semen. The child cannot guess that another substance besides urine is excreted from the male sexual organ, and occasionally an 'innocent' girl on her wedding night is still indignant at her husband 'urinating into her'. This information acquired in the years of pre-puberty is followed by a new access of sexual researches by the child. But the theories which he now produces no longer have the typical and original stamp which was characteristic of the primary theories of early childhood as long as the infantile sexual components could find expression in theories in an uninhibited and unmodified fashion. The child's later intellectual efforts at solving the puzzles of sex have not seemed to me worth collecting, nor can they have much claim to a pathogenic significance. Their multiplicity is of course mainly dependent on the nature of the enlightenment which a child receives; but their significance consists rather in the fact that they re-awaken the traces, which have since become unconscious, of his first period of sexual interest; so that it is not infrequent for masturbatory sexual activity and some degree of emotional detachment from his parents to be linked up with them. Hence the condemnatory judgement of teachers that enlightenment of such a kind at this age 'corrupts' children.

Let me give a few examples to show what elements often enter into these late speculations by children about sexual life. A girl had heard from her schoolmates that the husband gives his wife an egg, which she hatches out in her body. A boy, who had also heard of the egg, identified it with the testicle, which [in German] is vulgarly called by the same word [E]; and he racked his brains to make out how the contents of the scrotum could be constantly renewed. The information given seldom goes far enough to prevent important uncertainties about sexual events. Thus a girl may arrive at an expectation that intercourse occurs on one occasion only, but that it lasts a very long time - twenty-four hours - and that all the successive babies come from this single occasion. One would suppose that this child had got her knowledge of the reproductive process from certain insects; but it turned out that this was not so and that the theory emerged as a spontaneous creation. Other girls are ignorant of the period of gestation, the life in the womb, and assume that the baby appears immediately after the first night of intercourse. Marcel Prevost has turned this girlhood mistake into an amusing story in one of his '*Lettres de femmes*'. These later sexual researches of children, or of adolescents who have been retarded at the stage of childhood, offer an almost inexhaustible theme and one which is perhaps not uninteresting in general; but it is more remote from my present interest. I must only lay stress on the fact that in this field children produce many incorrect ideas in order to contradict older and better knowledge which has become unconscious and is repressed.

The way in which children react to the information they are given also has its significance. In some, sexual repression has gone so far that they will not listen to anything; and these succeed in remaining ignorant even in later life - *apparently* ignorant, at least - until, in the psycho-analysis of neurotics, the knowledge that originated in early childhood comes to light. I also know of two boys between ten and thirteen years old who, though it is true that they listened to the sexual information, rejected it with the words: 'Your father and other people may do something like that, but I know for certain *my* father never would.' But however widely children's later reactions to the satisfaction of their sexual curiosity may vary, we may assume that in the first years of childhood their attitude was absolutely uniform, and we may feel certain that at that time all of them tried most eagerly to discover what it was that their parents did with each other so as to produce babies.

SOME GENERAL REMARKS ON HYSTERICAL ATTACKS
(1909)

Intentionally left blank

1980

SOME GENERAL REMARKS ON HYSTERICAL ATTACKS

A

When one carries out the psycho-analysis of a hysterical woman patient whose complaint is manifested in attacks, one soon becomes convinced that these attacks are nothing else but phantasies translated into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in day-dreams or which can be elicited by interpretation from dreams at night. Often a dream takes the place of an attack, and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision as we employ for night-dreams. But not only are the forces from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too.

(1) The attack becomes unintelligible through the fact that it represents several phantasies in the same material simultaneously - that is to say through *condensation*. The elements common to the two (or more) phantasies constitute the nucleus of the representation, as they do in dreams. The phantasies which are thus made to coincide are often of quite a different nature. They may, for instance, be a recent wish and the re-activation of an infantile impression. The same innervations are in that case made to serve both purposes, often in a most ingenious way. Hysterical patients who make a very extensive use of condensation may find a single form of attack sufficient; others express their numerous pathogenic phantasies by a multiplication of the forms of attack.

(2) The attack becomes obscured through the fact that the patient attempts to carry out the activities of both the figures who appear in the phantasy, that is to say, through *multiple identification*. Compare, for instance, the example I mentioned in my paper on 'Hysterical Phantasies and their Relation to Bisexuality' (1908a), in which the patient tore off her dress with one hand (as the man) while she pressed it to her body with the other (as the woman).

(3) A particularly extensive distortion is effected by an *antagonistic inversion of the innervations*. This is analogous to the transformation of an element into its opposite, which commonly happens in the dream-work. For instance, an embrace may be represented in the attack by drawing back the arms convulsively till the hands meet over the spinal column. It is possible that the well-known *arc de cercle* which occurs during attacks in major hysteria is nothing else than an energetic repudiation like this, through antagonistic innervation, of a posture of the body that is suitable for sexual intercourse.

(4) Scarcely less confusing and misleading is a *reversal of the chronological order* within the phantasy that is portrayed, which once more has its complete counterpart in a number of dreams which begin with the end of the action and end with its beginning. Supposing, for instance, that a hysterical woman has a phantasy of seduction in which she is sitting reading in a park with her skirt slightly lifted so that her foot is visible; a gentleman approaches and speaks to her; they then go somewhere and make love to one another. This phantasy is acted out in the attack by her beginning with the convulsive stage, which corresponds to the coitus, by her then getting up, going into another room, sitting down and reading and presently answering an imaginary remark addressed to her.

The two last-mentioned forms of distortion give us some idea of the intensity of the resistances which the repressed material must take into account even when it breaks through in a hysterical attack.

B

The onset of hysterical attacks follows laws that are easily understandable. Since the repressed complex consists of a libidinal cathexis and an ideational content (the phantasy), the attack can be evoked (1) *associatively*, when the content of the complex (if sufficiently cathected) is touched on by something connected with it in conscious life; (2) *organically*, when, for internal somatic reasons and as a result of psychical influences from outside, the libidinal cathexis rises above a certain degree; (3) in the service of the *primary purpose* - as an expression of a 'flight into illness', when reality becomes distressing or frightening - that is, as a *consolation*; (4) in the service of the *secondary purposes*, with which the illness allies itself, as soon as, by producing an attack, the patient can achieve an aim that is useful to him. In the last case the attack is directed at particular individuals; it can be put off till they are present, and it gives an impression of being consciously simulated.

C

Investigation of the childhood history of hysterical patients shows that the hysterical attack is designed to take the place of an *auto-erotic* satisfaction previously practised and since given up. In a great number of cases this satisfaction (masturbation by contact or by pressure of the thighs, or, again, by movements of the tongue, and so on) recurs during the attack itself, while the subject's consciousness is deflected. Moreover, the onset of an attack that is due to an increase of libido and is in the service of the primary purpose - as a consolation - exactly repeats the conditions under which, at the earlier time, the patient had intentionally sought this auto-erotic satisfaction. The anamnesis of the patient shows the following stages: (a) auto-erotic satisfaction, without ideational content; (b) the same satisfaction, connected with a phantasy which leads to the act of satisfaction; (c) renunciation of the act, with retention of the phantasy; (d) repression of the phantasy, which then comes into effect as a hysterical attack, either in an unchanged form, or in a modified one and adapted to new environmental impressions. Furthermore, (e) the phantasy may even reinstate the act of satisfaction belonging to it which had ostensibly been given up. This is a typical cycle of infantile sexual activity: repression, failure of repression, and return of the repressed.

The involuntary passing of urine is certainly not to be regarded as incompatible with the diagnosis of a hysterical attack; it is merely repeating the infantile form of a violent pollution. Moreover, biting the tongue may also be met with in undoubted cases of hysteria. It is no more inconsistent with hysteria than it is with love-making. It occurs more readily in attacks if the patient's attention had been drawn by the doctor's questions to the difficulties of making a differential diagnosis. Self-injury may occur in hysterical attacks (more frequently in the case of men) where it repeats an accident in childhood - as, for instance, the result of a romp.

The loss of consciousness, the '*absence*'¹, in a hysterical attack is derived from the fleeting but unmistakable lapse of consciousness which is observable at the climax of every intense sexual satisfaction, including auto-erotic ones. This course of development can be traced with most certainty where hysterical *absences* arise from the onset of pollutions in young people of the female sex. The so-called 'hypnoid states' - *absences* during day-dreaming -, which are so common in hysterical subjects, show the same origin. The mechanism of these *absences* is comparatively simple. All the subject's attention is concentrated to begin with on the course of the process of satisfaction; with the occurrence of the satisfaction, the whole of this cathexis of attention is suddenly removed, so that there ensues a momentary void in her consciousness. This gap in consciousness, which might be termed a *physiological* one, is then widened in the service of repression, till it can swallow up everything that the repressing agency rejects.

D

What points the way for the motor discharge of the repressed libido in a hysterical attack is the reflex mechanism of the act of coition - a mechanism which is ready to hand in everybody, including women, and which we see coming into manifest operation when an unrestrained surrender is made to sexual activity. Already in ancient times coition was described as a 'minor epilepsy'. We might alter this and say that a convulsive hysterical attack is an equivalent of coition. The analogy with an epileptic fit helps us little, since its genesis is even less understood than that of hysterical attacks.

Speaking as a whole, hysterical attacks, like hysteria in general, revive a piece of sexual activity in women which existed during their childhood and at that time revealed an essentially masculine character. It can often be observed that girls who have shown a boyish nature and inclinations up to the years before puberty are precisely those who become hysterical from puberty onwards. In a whole number of cases the hysterical neurosis merely represents an excessive accentuation of the typical wave of repression which, by doing away with her masculine sexuality, allows the woman to emerge.²

FAMILY ROMANCES
(1909)

Intentionally left blank

1986

FAMILY ROMANCES

The liberation of an individual, as he grows up, from the authority of his parents is one of the most necessary though one of the most painful results brought about by the course of his development. It is quite essential that that liberation should occur and it may be presumed that it has been to some extent achieved by everyone who has reached a normal state. Indeed, the whole progress of society rests upon the opposition between successive generations. On the other hand, there is a class of neurotics whose condition is recognizably determined by their having failed in this task.

For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least *feels* he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from *him* than from *her*. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming¹ which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation.

¹ Cf. 'Hysterical Phantasies and their Relation to Bisexuality' (1908a), where a reference will be found to the literature of the subject.

When presently the child comes to know the difference in the parts played by fathers and mothers in their sexual relations, and realizes that '*pater semper incertus est*', while the mother is '*certissima*',¹ the family romance undergoes a curious curtailment: it contents itself with exalting the child's father, but no longer casts any doubts on his maternal origin, which is regarded as something unalterable. This second (sexual) stage of the family romance is actuated by another motive as well, which is absent in the first (asexual) stage. The child, having learnt about sexual processes, tends to picture to himself erotic situations and relations, the motive force behind this being his desire to bring his mother (who is the subject of the most intense sexual curiosity) into situations of secret infidelity and into secret love-affairs. In this way the child's phantasies, which started by being, as it were, asexual, are brought up to the level of his later knowledge.

Moreover the motive of revenge and retaliation, which was in the foreground at the earlier state, is also to be found at the later one. It is, as a rule, precisely these neurotic children who were punished by their parents for sexual naughtiness and who now revenge themselves on their parents by means of phantasies of this kind.

¹ [An old legal tag: 'paternity is always uncertain, maternity is most certain.']

A younger child is very specially inclined to use imaginative stories such as these in order to rob those born before him of their prerogatives - in a way which reminds one of historical intrigues; and he often has no hesitation in attributing to his mother as many fictitious love-affairs as he himself has competitors. An interesting variant of the family romance may then appear, in which the hero and author returns to legitimacy himself while his brothers and sisters are eliminated by being bastardized. So too if there are any other particular interests at work they can direct the course to be taken by the family romance; for its many-sidedness and its great range of applicability enable it to meet every sort of requirement. In this way, for instance, the young phantasy-builder can get rid of his forbidden degree of kinship with one of his sisters if he finds himself sexually attracted by her.

If anyone is inclined to turn away in horror from this depravity of the childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone by grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but exalting him. Indeed the whole effort at replacing the real father by a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows to-day to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the Emperor and Empress appear in dreams, those exalted personages stand for the dreamer's father and mother.¹ So that the child's overvaluation of his parents survives as well in the dreams of normal adults.

¹ Cf. my *Interpretation of Dreams* (1900a).

CONTRIBUTION TO A QUESTIONNAIRE ON READING (1907)

You ask me to name 'ten good books' for you, and refrain from adding to this any word of explanation. Thus you leave to me not only the choice of the books but also the interpretation of your request. Accustomed to paying attention to small signs, I must then trust the wording in which you couch your enigmatical demand. You did not say: 'the ten most magnificent works (of world literature)', in which case I should have been obliged to reply, with so many others: Homer, the tragedies of Sophocles, Goethe's *Faust*, Shakespeare's *Hamlet*, *Macbeth*, etc. Nor did you say the 'ten most significant books', among which scientific achievements like those of Copernicus, of the old physician Johann Weier on the belief in witches, Darwin's *Descent of Man*, and others, would then have found a place. You did not even ask for 'favourite books', among which I should not have forgotten Milton's *Paradise Lost* and Heine's *Lazarus*. I think, therefore, that a particular stress falls on the 'good' in your phrase, and that with this predicate you intend to designate books to which one stands in rather the same relationship as to 'good' friends, to whom one owes a part of one's knowledge of life and view of the world - books which one has enjoyed oneself and gladly commends to others, but in connection with which the element of timid reverence, the feeling of one's own smallness in the face of their greatness, is not particularly prominent.

I will therefore name ten such 'good' books for you which have come to my mind without a great deal of reflection.

Multatuli, *Letters and Works*.
 Kipling, *Jungle Book*.
 Anatole France, *Sur la pierre blanche*.
 Zola, *Fécondité*.
 Merezhkovsky, *Leonardo da Vinci*.
 G. Keller, *Leute von Seldwyla*.
 C. F. Meyer, *Huttens letzte Tage*.
 Macaulay, *Essays*.
 Gomperz, *Griechische Denker*.
 Mark Twain, *Sketches*.

I do not know what you intend to do with this list. It seems a most peculiar one even to me; I really cannot let it go without comment. The problem of why precisely these and not other equally 'good' books I will not begin to tackle; I merely wish to throw light on the relation between the author and his work. The connection is not in every case as firm as it is, for instance, with Kipling's *Jungle Book*. For the most part I could just as well have singled out another work by the same author - for instance, in the case of Zola, *Docteur Pascal* - and the like. The same man who has given us one good book has often presented us with several good books. In the case of Multatuli I felt in two minds whether to reject the private letters in favour of the 'Love Letters' or the latter in favour of the former, and for that reason wrote: 'Letters and Works'. Genuinely creative writing of purely, poetical value has been excluded from this list, probably because your charge - good books - did not seem exactly aimed at such; for in the case of C. F. Meyer's *Hutten* I must set its 'goodness' far above its beauty: 'edification' above aesthetic enjoyment.

You have touched on something, with your request to name for you 'ten good books', on which an immeasurable amount could be said. And so I will conclude, in order not to become even more informative.

Yours sincerely,
FREUD.

PROSPECTUS FOR *SCHRIFTEN ZUR ANGEWANDTEN SEELENKUNDE*
(1907)

The *Schriften zur angewandten Seelenkunde*, the first number of which is published herewith, are aimed at that wider circle of educated people who without actually being philosophers or medical men are nevertheless able to appreciate the science of the human mind for its significance in the understanding and deepening of our lives. The papers will appear in no prescribed order, but will present in each instance a single study, which will undertake the application of psychological knowledge to subjects in art and literature, in the history of civilizations and religions, and in analogous fields. These studies will sometimes bear the character of exact investigations, sometimes that of speculative efforts, attempting now to embrace a larger problem, now to penetrate into a more restricted one; but in every case they will be in the nature of original achievements and will avoid resembling mere reviews or compilations.

The Editor feels himself in duty bound to vouch for the originality and general merit of the articles appearing in this series. For the rest, he does not wish either to interfere with the independence of his contributors or to be held answerable for what they express. The fact that the first numbers of the series take particular account of the theories which he himself has advocated in the sphere of science should not determine the view taken of this enterprise. On the contrary, the series is open to the exponents of divergent opinions and hopes to be able to give expression to the variety of points of view and principles in contemporary science.

PREFACE TO WILHELM STEKEL'S
NERVOUS ANXIETY-STATES AND THEIR TREATMENT
(1908)

My investigations into the aetiology and psychical mechanism of neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psycho-analytic methods of examination and treatment to which I owe my findings. Dr. Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psycho-analysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psycho-analytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.

I will add that Dr. Stekel's work is founded upon rich experience and is calculated to stimulate other physicians into confirming by their own efforts our views on the aetiology of these conditions. His work reveals many unexpected glimpses of the realities of life, which so often lie concealed behind neurotic symptoms; and it may well convince our colleagues that the attitude they choose to adopt to the hints and explanations given in these pages cannot be a matter of indifference from the point of view either of their understanding or of their therapeutic efficiency.

VIENNA, *March* 1908

PREFACE TO SANDOR FERENCZI'S
PSYCHO-ANALYSIS: ESSAYS IN THE FIELD OF PSYCHO-ANALYSIS
(1910)

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion., myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

The author of the following essays, who is a close acquaintance of mine, and who is familiar, to an extent that few others are, with all the difficulties of psycho-analytic problems, is the first Hungarian to undertake the task of creating an interest in psycho-analysis among doctors and men of education in his own country through writings composed in their mother tongue. It is our cordial wish that this attempt of his may succeed and may result in gaining for this new field of work new workers from the body of his compatriots.

REVIEW OF GEORG BIEDENKAPP'S *IM KAMPFE GEGEN HIRNBACILLEN*

Concealed behind this somewhat unpromising title is the book of a brave man who succeeds in telling the reader much that is worthy of consideration. The sub-title of the work reveals more of its content: 'A Philosophy of Small Words'. The author is in fact fighting against those 'little words and arrangements of words which exclude or include too much' and which reveal, in people who have the habit of using them for preference, a tendency towards 'exclusive or superlative judgements'. It is self-evident - our author would contest even this phrase - that the fight is not concerned with these harmless words but with the tendency to become intoxicated by them and to forget, on account of the exaggerated representation thus achieved, the necessary limitations on our pronouncements and the inevitable relativity of our judgements. It really serves as a useful warning if one is shown how much that was described by people of an earlier generation as 'self-evident' or as 'nonsensical' ranks with us to-day conversely as nonsensical or self-evident; or if we observe, in a series of well-chosen examples, to what a narrowing of their mental horizon even important writers must plead guilty, as a result of their misuse of superlatives. The exhortation to moderation in judgement and expression actually serves our author only as a point of departure for further discussions on other 'errors of thought' of human beings - on the central delusion, faith, on atheistic morality, and the like. In all these observations is manifest the author's honest endeavour to take seriously the implications of the particular view of the world necessitated by the discoveries of modern science, in particular of the theory of evolution. A lot that is psychologically accurate is included, and many truths of the kind that have often been said before but cannot be often enough repeated. The author has set himself the thankless task 'of improving and converting people' by means of exerting a sober influence, without seeking to move them to laughter by humour or sweep them along with him by passion. Let us wish him all success.

II

REVIEW OF JOHN BIGELOW'S *THE MYSTERY OF SLEEP*

Solving the mystery of sleep might well have been reserved to science; the pious author, however, operates with biblical arguments and teleological causes. For example: it would be an idea unworthy of divine providence to suppose that it would allow human beings to spend a full third of their life in spiritual inactivity. Sleep is rather that state in which divine influence penetrates most freely and most effectively into human mental life. But in spite of all objections to the author's way of thinking we will not omit to emphasize the kernel of truth in his assertion. Scientific studies of the state of mental life during sleep, too, oblige us to relinquish as inadequate our previous assumption that sleep reduces the play of mental activity to a minimum. The important processes of unconscious mental and even intellectual activity continue - as the elucidation of dreams given by your reviewer demonstrates - even during profound sleep. This unconscious mental activity deserves to be called 'daemonic' but scarcely divine.

OBITUARY OF PROFESSOR S. HAMMERSCHLAG

S. Hammerschlag, who relinquished his activity as a Jewish religious teacher about thirty years ago, was one of those personalities who possess the gift of leaving ineradicable impressions on the development of their pupils. A spark from the same fire which animated the spirit of the great Jewish seers and prophets burned in him and was not extinguished until old age weakened his powers. But the passionate side of his nature was happily tempered by the ideal of humanism of our German classical period which governed him, and his method of education was based on the foundation of the philological and classical studies to which he had devoted his own youth. Religious instruction served him as a way of educating towards love of the humanities, and from the material of Jewish history he was able to find means of tapping the sources of enthusiasm hidden in the hearts of young people and of making it flow out far beyond the limitations of nationalism or dogma. Those of his pupils who were later allowed to seek him out in his own home gained a paternally solicitous friend in him and were able to perceive that sympathetic kindness was the fundamental characteristic of his nature. Feelings of gratitude towards a revered teacher - undiminished through the course of decades - received most dignified expression over his grave from Dr. Friedjung the historian.

ANALYSIS OF A PHOBIA IN A FIVE-YEAR-OLD BOY
(1909)

Intentionally left blank

2000

ANALYSIS OF A PHOBIA IN A FIVE-YEAR-OLD BOY

I

INTRODUCTION

In the following pages I propose to describe the course of the illness and recovery of a very youthful patient. The case history is not, strictly speaking, derived from my own observation. It is true that I laid down the general lines of the treatment, and that on one single occasion, when I had a conversation with the boy, I took a direct share in it; but the treatment itself was carried out by the child's father, and it is to him that I owe my sincerest thanks for allowing me to publish his notes upon the case. But his services go further than this. No one else, in my opinion, could possibly have prevailed on the child to make any such avowals; the special knowledge by means of which he was able to interpret the remarks made by his five-year-old son was indispensable, and without it the technical difficulties in the way of conducting a psycho-analysis upon so young a child would have been insuperable. It was only because the authority of a father and of a physician were united in a single person, and because in him both affectionate care and scientific interest were combined, that it was possible in this one instance to apply the method to a use to which it would not otherwise have lent itself.

But the peculiar value of this observation lies in the considerations which follow. When a physician treats an adult neurotic by psycho-analysis, the process he goes through of uncovering the psychical formations, layer by layer, eventually enables him to frame certain hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he believes he has discovered the motive forces of all the neurotic symptoms of later life. I have set out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905d), and I am aware that they seem as strange to an outside reader as they seem incontrovertible to a psycho-analyst. But even a psycho-analyst may confess to the wish for a more direct and less roundabout proof of these fundamental theorems. Surely there must be a possibility of observing in children at first hand and in all the freshness of life the sexual impulses and wishes which we dig out so laboriously in adults from among their own débris - especially as it is also our belief that they are the common property of all men, a part of the human constitution, and merely exaggerated or distorted in the case of neurotics.

With this end in view I have for many years been urging my pupils and my friends to collect observations of the sexual life of children - the existence of which has as a rule been cleverly overlooked or deliberately denied. Among the material which came into my possession as a result of these requests, the reports which I received at regular intervals about little Hans soon began to take a prominent place. His parents were both among my closest adherents, and they had agreed that in bringing up their first child they would use no more coercion than might be absolutely necessary for maintaining good behaviour. And, as the child developed into a cheerful, good-natured and lively little boy, the experiment of letting him grow up and express himself without being intimidated went on satisfactorily. I shall now proceed to reproduce his father's records of little Hans just as I received them; and I shall of course refrain from any attempt at spoiling the *naïveté* and directness of the nursery by making any conventional emendations.

The first reports of Hans date from a period when he was not quite three years old. At that time, by means of various remarks and questions, he was showing a quite peculiarly lively interest in that portion of his body which he used to describe as his 'widdler'.¹ Thus he once asked his mother this question:

Hans: 'Mummy, have you got a widdler too?'

Mother: 'Of course. Why?'

Hans: 'I was only just thinking.'

At the same age he went into a cow-shed once and saw a cow being milked. 'Oh, look!' he said, 'there's milk coming out of its widdler!'

Even these first observations begin to rouse an expectation that much, if not most, of what little Hans shows us will turn out to be typical of the sexual development of children in general. I once put forward the view² that there was no need to be too much horrified at finding in a woman the idea of sucking at a male organ. This repellent impulse, I argued, had a most innocent origin, since it was derived from sucking at the mother's breast; and in this connection, I went on, a cow's udder plays an apt part as an intermediate image, being in its nature a *mamma* and in its shape and position a penis. Little Hans's discovery confirms the latter part of my contention.

Meanwhile his interest in widdlers was by no means a purely theoretical one; as might have been expected, it also impelled him to *touch* his member. When he was three and a half his mother found him with his hand on his penis. She threatened him in these words: 'If you do that, I shall send for Dr. A. to cut off your widdler. And then what'll you widdle with?'

Hans: 'With my bottom.'

¹ ['*Wiwimacher*' in the original.]

² See my 'Fragment of an Analysis of a Case of Hysteria' (1905e).

He made this reply without having any sense of guilt as yet. But this was the occasion of his acquiring the 'castration complex', the presence of which we are so often obliged to infer in analysing neurotics, though they one and all struggle violently against recognizing it. There is much of importance to be said upon the significance of this element in the life of a child. The 'castration complex' has left marked traces behind it in myths (and not only in Greek myths); in a passage in my *Interpretation of Dreams*, and elsewhere, I have touched upon the part it plays.¹

¹ [*Footnote added 1923:*] - Since this was written, the study of the castration complex has been further developed in contributions to the subject by Lou Andreas-Salomé, A. Stärcke, F. Alexander, and others. It has been urged that every time his mother's breast is withdrawn from a baby he is bound to feel it as castration (that is to say, as the loss of what he regards as an important part of his own body); that, further, he cannot fail to be similarly affected by the regular loss of his faeces; and, finally, that the act of birth itself (consisting as it does in the separation of the child from his mother, with whom he has hitherto been united) is the prototype of all castration. While recognizing all of these roots of the complex, I have nevertheless put forward the view that the term 'castration complex' ought to be confined to those excitations and consequences which are bound up with the loss of the *penis*. Any one who, in analysing adults, has become convinced of the invariable presence of the castration complex, will of course find difficulty in ascribing its origin to a chance threat - of a kind which is not, after all, of such universal occurrence; he will be driven to assume that children construct this danger for themselves out of the slightest hints, which will never be wanting. This circumstance is also the motive, indeed, that has stimulated the search for those deeper roots of the complex which are universally forthcoming. But this makes it all the more valuable that in the case of little Hans the threat of castration is reported by his parents themselves, and moreover at a date before there was any question of his phobia.

At about the same age (three and a half), standing in front of the lions' cage at Schönbrunn, little Hans called out in a joyful and excited voice: 'I saw the lion's widdler.'

Animals owe a good deal of their importance in myths and fairy tales to the openness with which they display their genitals and their sexual functions to the inquisitive little human child. There can be no doubt about Hans's sexual curiosity; but it also roused the spirit of enquiry in him and enabled him to arrive at genuine abstract knowledge.

When he was at the station once (at three and three quarters) he saw some water being let out of an engine. 'Oh, look,' he said, 'the engine's widdling. Where's it got its widdler?'

After a little he added in reflective tones: 'A dog and a horse have widdlers; a table and a chair haven't.' He had thus got hold of an essential characteristic for differentiating between animate and inanimate objects.

Thirst for knowledge seems to be inseparable from sexual curiosity. Hans's curiosity was particularly directed towards his parents.

Hans (aged three and three-quarters): 'Daddy, have you got a widdler too?'

Father: 'Yes, of course.'

Hans: 'But I've never seen it when you were undressing.'

Another time he was looking on intently while his mother undressed before going to bed. 'What are you staring like that for?' she asked.

Hans: 'I was only looking to see if you'd got a widdler too.'

Mother: 'Of course. Didn't you know that?'

Hans: 'No. I thought you were so big you'd have a widdler like a horse.'

This expectation of little Hans's deserves to be borne in mind; it will become important later on.

But the great event of Hans's life was the birth of his little sister Hanna when he was exactly three and a half.¹ His behaviour on that occasion was noted down by his father on the spot: 'At five in the morning', he writes, 'labour began, and Hans's bed was moved into the next room. He woke up there at seven, and, hearing his mother groaning, asked: "Why's Mummy coughing?" Then, after a pause, "The stork's coming to-day for certain."

'Naturally he has often been told during the last few days that the stork is going to bring a little girl or a little boy; and he quite rightly connected the unusual sounds of groaning with the stork's arrival.

'Later on he was taken into the kitchen. He saw the doctor's bag in the front hall and asked: "What's that?" "A bag," was the reply. Upon which he declared with conviction: "The stork's coming to-day." After the baby's delivery the midwife came into the kitchen and Hans heard her ordering some tea to be made. At this he said: "I know! Mummy's to have some tea because she's coughing." He was then called into the bedroom. He did not look at his mother, however, but at the basins and other vessels, filled with blood and water, that were still standing about the room. Pointing to the blood-stained bed-pan, he observed in a surprised voice: "But blood doesn't come out of *my* widdler."

'Everything he says shows that he connects what is strange in the situation with the arrival of the stork. He meets everything he sees with a very suspicious and intent look, and *there can be no question that his first doubts about the stork have taken root.*

'Hans is very jealous of the new arrival, and whenever any one praises her, says she is a lovely baby, and so on, he at once declares scornfully: "But she's not got any teeth yet."² And in fact when he saw her for the first time he was very much surprised that she was unable to speak, and decided that this was because she had no teeth. During the first few days he was naturally put very much in the background. He was suddenly taken ill with a sore throat. In his fever he was heard saying: "But I don't *want* a baby sister!"

¹ April 1903 to October 1906.

² This again is a typical mode of behaviour. Another little boy, only two years his sister's senior, used to parry similar remarks with an angry cry of 'Too 'ickle! too 'ickle!'

'Some six months later he had got over his jealousy, and his brotherly affection for the baby was only equalled by his sense of his own superiority over her.'¹

'A little later Hans was watching his seven-day-old sister being given a bath. "But her widdler's still quite small," he remarked; and then added, as though by way of consolation: "When she grows up it'll get bigger all right."²

¹ Another child, rather older than Hans, welcomed his younger brother with the words: 'The stork can take him away again.' Compare in this connection my remarks in *The Interpretation of Dreams* on dreams of the death of loved relatives.

² Two other boys were reported to me as having made the same judgement, expressed in identical words and followed by the same anticipation, when they were allowed to satisfy their curiosity and look at their baby sister's body for the first time. One might well feel horrified at such signs of the premature decay of a child's intellect. Why was it that these young enquirers did not report what they really saw - namely, that there was no widdler there? In little Hans's case, at all events, we can account completely for the faulty perception. We are aware that by a process of careful induction he had arrived at the general proposition that every animate object, in contradistinction to inanimate ones, possesses a widdler. His mother had confirmed him in this conviction by giving him corroborative information in regard to persons inaccessible to his own observation. He was now utterly incapable of surrendering what he had achieved merely on the strength of this single observation made upon his little sister. He therefore made a judgement that in that instance also there was a widdler present, only that it was still very small, but that it would grow till it was as big as a horse's.

We can go a step further in vindicating little Hans's honour. As a matter of fact, he was behaving no worse than a philosopher of the school of Wundt. In the view of that school, consciousness is the invariable characteristic of what is mental, just as in the view of little Hans a widdler is the indispensable criterion of what is animate. If now the philosopher comes across mental processes whose existence cannot but be inferred, but about which there is not a trace of consciousness to be detected - for the subject, in fact, knows nothing of them, although it is impossible to avoid inferring their existence - then, instead of saying that they are *unconscious* mental processes, he calls them *semi-conscious*. The widdler's still very small! And in this comparison the advantage is in favour of little Hans. For, as is so often the case with the sexual researches of children, behind the mistake a piece of genuine knowledge lies concealed. Little girls *do* possess a small widdler, which we call a clitoris, though it does not grow any larger but remains permanently stunted. Compare my short paper on 'The Sexual Theories of Children' (1908c).

‘At the same age (when he was three and three-quarters) Hans produced his first account of a dream: "To-day when I was asleep I thought I was at Gmunden with Mariedl."

‘Mariedl was the thirteen-year-old daughter of our landlord and used often to play with him.’

As Hans’s father was telling his mother the dream in his presence, he corrected him, saying: ‘Not with Mariedl, but quite alone with Mariedl.’

In this connection we learn: ‘In the summer of 1906 Hans was at Gmunden, and used to run about all day long with our landlord’s children. When we left Gmunden we thought he would be very much upset by having to come away and move back to town. To our surprise this was not so. He seemed glad of the change, and for several weeks he talked very little about Gmunden. It was not until after some weeks had passed that there began to emerge reminiscences - often vividly coloured - of the time he had spent at Gmunden. During the last four weeks or so he has been working these reminiscences up into phantasies. He imagines that he is playing with the other children, with Berta, Olga, and Fritzl; he talks to them as though they were really with him, and he is capable of amusing himself in this way for hours at a time. Now that he has got a sister and is obviously taken up with the problem of the origin of children, he always calls Berta and Olga "his children"; and once he added: "my children Berta and Olga were brought by the stork too." The dream, occurring now, after six months’ absence from Gmunden, is evidently to be read as an expression of a longing to go back there.’

Thus far his father. I will anticipate what is to come by adding that when Hans made this last remark about his children having been brought by the stork, he was contradicting aloud a doubt that was lurking within him.

His father luckily made a note of many things which turned out later on to be of unexpected value. 'I drew a giraffe for Hans, who has been to Schönbrunn several times lately. He said to me: "Draw its widdler too." "Draw it yourself," I answered; whereupon he added this line to my picture (see Fig. 1). He began by drawing a short stroke, and then added a bit on to it, remarking: "Its widdler's longer."

Fig 1.

'Hans and I walked past a horse that was micturating, and he said: "The horse has got its widdler underneath like me."

'He was watching his three-months-old sister being given a bath, and said in pitying tones: "She *has* got a tiny little widdler."

'He was given a doll to play with and undressed it. He examined it carefully and said: "Her widdler's ever so tiny."

As we already know, this formula made it possible for him to go on believing in his discovery (see p. 2005).

Every investigator runs the risk of falling into an occasional error. It is some consolation for him if, like little Hans in the next example, he does not err alone but can quote a common linguistic usage in his support. For Hans saw a monkey in his picture-book one day, and pointing to its up-curved tail, said: 'Daddy, look at its widdler!'

His interest in widdlers led him to invent a special game of his own. 'Leading out of the front hall there is a lavatory and also a dark storeroom for keeping wood in. For some time past Hans has been going into this wood-cupboard and saying: "I'm going to my W.C." I once looked in to see what he was doing in the dark storeroom. He showed me his parts and said: "I'm widdling." That is to say, he has been "playing" at W.C. That it is in the nature of a game is shown not merely by the fact that he was only pretending to widdle, but also by the fact that he does not go into the W.C., which would after all be far simpler, but prefers the wood-cupboard and calls it "his W.C."

We should be doing Hans an injustice if we were to trace only the auto-erotic features of his sexual life. His father has detailed information to give us on the subject of his love relationships with other children. From these we can discern the existence of an 'object-choice' just as in the case of an adult; and also, it must be confessed, a very striking degree of inconstancy and a disposition to polygamy.

'In the winter (at the age of three and three-quarters) I took Hans to the skating rink and introduced him to my friend N.'s two little daughters, who were about ten years old. Hans sat down beside them, while they, in the consciousness of their mature age, looked down on the little urchin with a good deal of contempt; he gazed at them with admiration, though this proceeding made no great impression on them. In spite of this Hans always spoke of them afterwards as "my little girls". "Where are my little girls? When are my little girls coming?" And for some weeks he kept tormenting me with the question: "When am I going to the rink again to see my little girls?"

A five-year-old boy cousin came to visit Hans, who had by then reached the age of four. Hans was constantly putting his arms round him, and once, as he was giving him one of these tender embraces, said: 'I *am* so fond of you.'

This is the first trace of homosexuality that we have come across in him, but it will not be the last. Little Hans seems to be a positive paragon of all the vices.

'When Hans was four years old we moved into a new flat. A door led out of the kitchen on to a balcony, from which one could see into a flat on the opposite side of the courtyard. In this flat Hans discovered a little girl of about seven or eight. He would sit on the step leading on to the balcony so as to admire her, and would stop there for hours on end. At four o'clock in the afternoon in particular, when the little girl came home from school, he was not to be kept in the room, and nothing could induce him to abandon his post of observation. Once, when the little girl failed to make her appearance at the window at her usual hour, Hans grew quite restless, and kept pestering the servants with questions. "When's the little girl coming? Where's the little girl?" and so on. When she did appear at last, he was quite blissful and never took his eyes off the flat opposite. The violence with which this "long-range love"¹ came over him is to be explained by his having no playmates of either sex. Spending a good deal of time with other children clearly forms part of a child's normal development.

'Hans obtained some companionship of this kind when, shortly afterwards (he was by then four and a half), we moved to Gmunden for the summer holidays. In our house there his playmates were our landlord's children: Franzl (about twelve years old), Fritzl (eight), Olga (seven), and Berta (five). Besides these there were the neighbour's children, Anna (ten), and two other little girls of nine and seven whose names I have forgotten. Hans's favourite was Fritzl; he often hugged him and made protestations of his love. Once when he was asked: "Which of the girls are you fondest of?" he answered: "Fritzl!" At the same time he treated the girls in a most aggressive, masculine and arrogant way, embracing them and kissing them heartily - a process to which Berta in particular offered no objection. When Berta was coming out of the room one evening he put his arms round her neck and said in the fondest tones: "Berta, you *are* a dear!" This, by the way, did not prevent his kissing the others as well and assuring them of his love. He was fond, too, of the fourteen-year-old Mariedl - another of our landlord's daughters - who used to play with him. One evening as he was being put to bed he said: "I want Mariedl to sleep with me." On being told that would not do, he said: "Then she shall sleep with Mummy or with Daddy." He was told that would not do either, but that Mariedl must sleep with her own father and mother. Upon which the following dialogue took place:

'Hans: "Oh, then I'll just go downstairs and sleep with Mariedl."

'Mother: "You really want to go away from Mummy and sleep downstairs?"

'Hans: "Oh, I'll come up again in the morning to have breakfast and do number one."

'Mother: "Well, if you really want to go away from Daddy and Mummy, then take your coat and knickers - and good-bye!"

'Hans did in fact take his clothes and go towards the staircase, to go and sleep with Mariedl, but, it need hardly be said, he was fetched back.

'(Behind his wish, "I want Mariedl to sleep with us," there of course lay another one: "I want Mariedl" (with whom he liked to be so much) "to become one of our family." But Hans's father and mother were in the habit of taking him into their bed, though only occasionally, and there can be no doubt that lying beside them had aroused erotic feelings in him; so that his wish to sleep with Mariedl had an erotic sense as well. Lying in bed with his father or mother was a source of erotic feelings in Hans just as it is in every other child.'

In spite of his accesses of homosexuality, little Hans bore himself like a true man in the face of his mother's challenge.

¹ Und die Liebe per Distanz,
Kurzgesagt, missfällt mir ganz.
WILHELM BUSCH

[Long-range love, I must admit, Does not suit my taste a bit.]

'In the next instance, too, Hans said to his mother: "I say, I *should* so like to sleep with the little girl." This episode has given us a great deal of entertainment, for Hans has really behaved like a grown-up person in love. For the past few days a pretty little girl of about eight has been coming to the restaurant where we have lunch. Of course Hans fell in love with her on the spot. He keeps constantly turning round in his chair to take furtive looks at her; when he has finished eating, he stations himself in her vicinity so as to flirt with her, but if he finds he is being observed, he blushes scarlet. If his glances are returned by the little girl, he at once looks shamefacedly the other way. His behaviour is naturally a great joy to every one lunching at the restaurant. Every day as he is taken there he says: "Do you think the little girl will be there to-day?" And when at last she appears, he goes quite red, just as a grown-up person would in such a case. One day he came to me with a beaming face and whispered in my ear: "Daddy, I know where the little girl lives. I saw her going up the steps in such-and-such a place." Whereas he treats the little girls at home aggressively, in this other affair he appears in the part of a platonic and languishing admirer. Perhaps this has to do with the little girls at home being village children, while the other is a young lady of refinement. As I have already mentioned, he once said he would like to sleep with her.

'Not wanting Hans to be left in the overwrought state to which he had been brought by his passion for the little girl, I managed to make them acquainted, and invited the little girl to come and see him in the garden after he had finished his afternoon sleep. Hans was so much excited at the prospect of the little girl coming, that for the first time he could not get off to sleep in the afternoon, but tossed about restlessly on his bed. When his mother asked, "Why aren't you asleep? Are you thinking about the little girl?" he said "Yes" with a happy look. And when he came home from the restaurant he said to every one in the house: "I say, my little girl's coming to see me to-day." The fourteen-year-old Mariel reported that he had repeatedly kept asking her: "I say, do you think she'll be nice to me? Do you think she'll kiss me if I kiss her?" and so on.

'But in the afternoon it rained, so that the visit did not come off, and Hans consoled himself with Berta and Olga.'

Other observations, also made at the time of the summer holidays, suggest that all sorts of new developments were going on in the little boy.

'Hans, four and a quarter. This morning Hans was given his usual daily bath by his mother and afterwards dried and powdered. As his mother was powdering round his penis and taking care not to touch it, Hans said: "Why don't you put your finger there?"

'*Mother*. "Because that'd be piggish."

'*Hans*: "What's that? Piggish? Why?"

'*Mother*. "Because it's not proper."

'*Hans* (laughing): "But it's great fun."¹

At about the same period Hans had a dream which was in striking contrast with the boldness he had shown towards his mother. It was the first dream of his that was made unrecognizable by distortion. His father's penetration, however, succeeded in clearing it up.

'Hans, four and a quarter. *Dream*. This morning Hans woke up and said: "I say, last night I thought: *Some one said: 'Who wants to come to me?' Then some one said: 'I do.'* Then he had to make him widdle."

¹ Another mother, a neurotic, who was unwilling to believe in infantile masturbation, told me of a similar attempt at seduction on the part of her three-and-a-half-year-old daughter. She had had a pair of drawers made for the little girl, and was trying them on her to see whether they were not too tight for walking. To do this she passed her hand upwards along the inner surface of the child's thigh. Suddenly the little girl shut her legs together on her mother's hand, saying: 'Oh, Mummy, do leave your hand there. It feels so lovely.'

'Further questions made it clear that there was no visual content whatever in this dream, and that it was of the purely auditory type. During the last few days Hans has been playing parlour games and "forfeits" with our landlord's children, amongst whom are his friends Olga (aged seven) and Berta (aged five). (The game of forfeits is played in this way: A: "Whose is this forfeit in my hand?" B: "Mine." Then it is decided what B must do.) The dream was modelled on this game; only what Hans wished was that the person to whom the forfeit belonged should be condemned, not to give the usual kiss or be given the usual box on the ear, but to widdle, or rather to be made to widdle by someone.

'I got him to tell me the dream again. He told it in the same words, except that instead of "then some one said" this time he said "then she said". This "she" is obviously Berta or Olga, one of the girls he had been playing with. Translated, the dream ran as follows: "I was playing forfeits with the little girls. I asked: 'Who wants to come to me?' She (Berta or Olga) replied: 'I do.' Then she had to make me widdle." (That is, she had to assist him in micturating, which is evidently agreeable for Hans.)

'It is clear that being made to widdle - having his knickers unbuttoned and his penis taken out - is a pleasurable process for Hans. On walks it is mostly his father who assists Hans in this way; and this gives the child an opportunity for the fixation of homosexual inclinations upon him.

'Two days ago, as I have already reported, while his mother was washing and powdering his genital region, he asked her: "Why don't you put your finger there?" Yesterday, when I was helping Hans to do number one, he asked me for the first time to take him to the back of the house so that no one should see him. He added: "Last year when I widdled, Berta and Olga watched me." This meant, I think, that last year he had enjoyed being watched by the girls, but that this was no longer so. His exhibitionism has now succumbed to repression. The fact that the wish that Berta and Olga should watch him widdling (or make him widdle) is now repressed in real life is the explanation of its appearance in the dream, where it was neatly disguised under the game of forfeits. - I have repeatedly observed since then that he does not like to be seen widdling.'

I will only add that this dream obeys the rule I have given in *The Interpretation of Dreams*, to the effect that speeches occurring in dreams are derived from speeches heard or spoken by the dreamer during the preceding days.

Hans's father has noted down one other observation, dating from the period immediately after their return to Vienna: 'Hans (aged four and a half) was again watching his little sister being given her bath, when he began laughing. On being asked why he was laughing, he replied: "I'm laughing at Hanna's widdler." "Why?" "Because her widdler's so lovely."

'Of course his answer was a disingenuous one. In reality her widdler had seemed to him *funny*. Moreover, this is the first time he has recognized in this way the distinction between male and female genitals instead of denying it.'

II

CASE HISTORY AND ANALYSIS

My dear Professor, I am sending you a little more about Hans - but this time, I am sorry to say, material for a case history. As you will see, during the last few days he has developed a nervous disorder, which has made my wife and me most uneasy, because we have not been able to find any means of dissipating it. I shall venture to call upon you tomorrow, . . . but in the meantime . . . I enclose a written record of the material available.

'No doubt the ground was prepared by sexual over-excitation due to his mother's tenderness; but I am not able to specify the actual exciting cause. He is afraid *a horse will bite him in the street*, and this fear seems somehow to be connected with his having been frightened by a large penis. As you know from a former report, he had noticed at a very early age what large penises horses have, and at that time he inferred that as his mother was so large she must have a widdler like a horse.

'I cannot see what to make of it. Has he seen an exhibitionist somewhere? Or is the whole thing simply connected with his mother? It is not very pleasant for us that he should begin setting us problems so early. Apart from his being afraid of going into the street and from his being in low spirits in the evening, he is in other respects the same Hans, as bright and cheerful as ever.'

We will not follow Hans's father either in his easily comprehensible anxieties or in his first attempts at finding an explanation; we will begin by examining the material before us. It is not in the least our business to 'understand' a case at once: this is only possible at a later stage, when we have received enough impressions of it. For the present we will suspend our judgement and give our impartial attention to everything that there is to observe.

The earliest accounts, dating from the first days in January of the present year (1908), run as follows:

'Hans (aged four and three-quarters) woke up one morning in tears. Asked why he was crying, he said to his mother: "When I was asleep I thought you were gone and I had no Mummy to coax with."¹

'An anxiety dream, therefore.

'I had already noticed something similar at Gmunden in the summer. When he was in bed in the evening he was usually in a very sentimental state. Once he made a remark to this effect: "Suppose I was to have no Mummy", or "Suppose you were to go away", or something of the sort; I cannot remember the exact words. Unfortunately, when he got into an elegiac mood of that kind, his mother used always to take him into bed with her.

'On about January 5th he came into his mother's bed in the morning, and said: "Do you know what Aunt M. said? She said: 'He *has* got a dear little thingummy.'"² (Aunt M. was stopping with us four weeks ago. Once while she was watching my wife giving the boy a bath she did in fact say these words to her in a low voice. Hans had overheard them and was now trying to put them to his own uses.)

'On January 7th he went to the Stadtpark with his nurse maid as usual. In the street he began to cry and asked to be taken home, saying that he wanted to "coax" with his Mummy. At home he was asked why he had refused to go any farther and had cried, but he would not say. Till the evening he was cheerful, as usual. But in the evening he grew visibly frightened; he cried and could not be separated from his mother, and wanted to "coax" with her again. Then he grew cheerful again, and slept well.

¹ 'Hans' expression for "to caress".'

² Meaning his penis. It is one of the commonest things - psycho-analyses are full of such incidents - for children's genitals to be caressed, not only in word but in deed, by fond relatives, including even parents themselves.

'On January 8th my wife decided to go out with him herself, so as to see what was wrong with him. They went to Schönbrunn, where he always likes going. Again he began to cry, did not want to start, and was frightened. In the end he did go; but was visibly frightened in the street. On the way back from Schönbrunn he said to his mother, after much internal struggling: "*I was afraid a horse would bite me.*" (He had, in fact, become uneasy at Schönbrunn when he saw a horse.) In the evening he seems to have had another attack similar to that of the previous evening, and to have wanted to be "coaxed" with. He was calmed down. He said, crying: "I know I shall have to go for a walk again to-morrow." And later: "The horse'll come into the room."

'On the same day his mother asked: "Do you put your hand to your widdler?" and he answered: "Yes. Every evening, when I'm in bed." The next day, January 9th, he was warned, before his afternoon sleep, not to put his hand to his widdler. When he woke up he was asked about it, and said he had put it there for a short while all the same.'

Here, then, we have the beginning of Hans's anxiety as well as of his phobia. As we see, there is good reason for keeping the two separate. Moreover, the material seems to be amply sufficient for giving us our bearings; and no moment of time is so favourable for the understanding of a case as its initial stage, such as we have here, though unluckily that stage is as a rule neglected or passed over in silence. The disorder set in with thoughts that were at the same time fearful and tender, and then followed an anxiety dream on the subject of losing his mother and so not being able to coax with her any more. His affection for his mother must therefore have become enormously intensified. This was the fundamental phenomenon in his condition. In support of this, we may, recall his two attempts at seducing his mother, the first of which dated back to the summer, while the second (a simple commendation of his penis) occurred immediately before the outbreak of his street-anxiety. It was this increased affection for his mother which turned suddenly into anxiety - which, as we should say, succumbed to repression. We do not yet know from what quarter the impetus towards repression may have come. Perhaps it was merely the result of the intensity of the child's emotions, which had become greater than he could control; or perhaps other forces which we have not yet recognized were also at work. This we shall learn as we go on. Hans's anxiety, which thus corresponded to a repressed erotic longing, was, like every infantile anxiety, without an object to begin with: it was still anxiety and not yet fear. The child cannot tell what he is afraid of; and when Hans, on the first walk with the nursemaid, would not say what he was afraid of, it was simply that he himself did not yet know. He said all that he knew, which was that in the street he missed his mother, whom he could coax with, and that he did not want to be away from her. In saying this he quite straightforwardly confessed the primary meaning of his dislike of streets.

Then again, there were the states into which he fell on two consecutive evenings before going to sleep, and which were characterized by anxiety mingled with clear traces of tenderness. These states show that at the beginning of his illness there was as yet no phobia whatever present, whether of streets or of walking or even of horses. If there had been, his evening states would be inexplicable; for who bothers at bed time about streets and walking? On the other hand it becomes quite clear why he was so fearful in the evening, if we suppose that at bedtime he was overwhelmed by an intensification of his libido - for its object was his mother, and its aim may perhaps have been to sleep with her. He had besides learnt from his experience that *at Gmunden* his mother could be prevailed upon, when he got into such moods, to take him into her bed, and he wanted to gain the same ends here in Vienna. Nor must we forget that for part of the time at Gmunden he had been alone with his mother, as his father had not been able to spend the whole of the holidays there, and further, that in the country his affections had been divided among a number of playmates and friends of both sexes, while in Vienna he had none, so that his libido was in a position to return undivided to his mother.

His anxiety, then, corresponded to repressed longing. But it was not the same thing as the longing: the repression must be taken into account too. Longing can be completely transformed into satisfaction if it is presented with the object longed for. Therapy of that kind is no longer effective in dealing with anxiety. The anxiety remains even when the longing can be satisfied. It can no longer be completely retransformed into libido; there is something that keeps the libido back under repression.¹ This was shown to be so in the case of Hans on the occasion of his next walk, when his mother went with him. He was with his mother, and yet he still suffered from anxiety - that is to say, from an unsatisfied longing for her. It is true that the anxiety was less; for he did allow himself to be induced to go for the walk, whereas he had obliged the nursemaid to turn back. Nor is a street quite the right place for 'coaxing', or whatever else this young lover may have wanted. But his anxiety had stood the test; and the next thing for it to do was to find an object. It was on this walk that he first expressed a fear that a horse would bite him. Where did the material for this phobia come from? Probably from the complexes, as yet unknown to us, which had contributed to the repression and were keeping under repression his libidinal feelings towards his mother. That is an unsolved problem, and we shall now have to follow the development of the case in order to arrive at its solution. Hans's father has already given us certain clues, probably trustworthy ones, such as that Hans had always observed horses with interest on account of their large widdlers, that he had supposed that his mother must have a widdler like a horse, and so on. We might thus be led to think that the horse was merely a substitute for his mother. But if so, what would be the meaning of his being afraid in the evening that a horse would come into the room? A small boy's foolish fears, it will be said. But a neurosis never says foolish things, any more than a dream. When we cannot understand something, we always fall back on abuse. An excellent way of making a task lighter.

¹ To speak quite frankly, this is actually the criterion according to which we decide whether such feelings of mingled apprehension and longing are normal or not: we begin to call them 'pathological anxiety' from the moment at which they can no longer be relieved by the attainment of the object longed for.

There is another point in regard to which we must avoid giving way to this temptation. Hans admitted that every night before going to sleep he amused himself with playing with his penis. 'Ah!' the family doctor will be inclined to say, 'now we have it. The child masturbated: hence his pathological anxiety.' But gently. That the child was getting pleasure for himself by masturbating does not by any means explain his anxiety; on the contrary, it makes it more problematical than ever. States of anxiety are not produced by masturbation or by getting satisfaction in any shape. Moreover, we may presume that Hans, who was now four and three-quarters, had been indulging in this pleasure every evening for at least a year (see p. 2003). And we shall find that at this moment he was actually engaged in a struggle to break himself of the habit - a state of things which fits in much better with repression and the generation of anxiety.

We must say a word, too, on behalf of Hans's excellent and devoted mother. His father accuses her, not without some show of justice, of being responsible for the outbreak of the child's neurosis, on account of her excessive display of affection for him and her too frequent readiness to take him into her bed. We might as easily blame her for having precipitated the process of repression by her energetic rejection of his advances ('that'd be piggish'). But she had a predestined part to play, and her position was a hard one.

I arranged with Hans's father that he should tell the boy that all this business about horses was a piece of nonsense and nothing more. The truth was, his father was to say, that he was very fond of his mother and wanted to be taken into her bed. The reason he was afraid of horses now was that he had taken so much interest in their widdlers. He himself had noticed that it was not right to be so very much preoccupied with widdlers, even with his own, and he was quite right in thinking this. I further suggested to his father that he should begin giving Hans some enlightenment in the matter of sex knowledge. The child's past behaviour justified us in assuming that his libido was attached to a wish to see his mother's widdler; so I proposed to his father that he should take away this aim from Hans by informing him that his mother and all other female beings (as he could see from Hanna) had no widdler at all. This last piece of enlightenment was to be given him on a suitable occasion when it had been led up to by some question or some chance remark on Hans's part.

The next batch of news about Hans covers the period from March 1st to March 17th. The interval of more than a month will be accounted for directly.

'After Hans had been enlightened,¹ there followed a fairly quiet period, during which he could be induced without any particular difficulty to go for his daily walk in the Stadtpark. His fear of horses became transformed more and more into a compulsion to look at them. He said: "I have to look at horses, and then I'm frightened."

'After an attack of influenza, which kept him in bed for two weeks, his phobia increased again so much that he could not be induced to go out, or at any rate no more than on to the balcony. Every Sunday he went with me to Lainz,² because on that day there is not much traffic in the streets, and it is only a short way to the station. On one occasion in Lainz he refused to go for a walk outside the garden because there was a carriage standing in front of it. After another week which he has had to spend indoors because he has had his tonsils cut, the phobia has grown very much worse again. He goes out on to the balcony, it is true, but not for a walk. As soon as he gets to the street door he hurriedly turns round.

'On Sunday, March 1st, the following conversation took place on the way to the station. I was once more trying to explain to him that horses do not bite. *He*: "But white horses bite. There's a white horse at Gmunden that bites. If you hold your finger to it it bites." (I was struck by his saying "finger" instead of "hand".) He then told me the following story, which I give here in a connected form: "When Lizzi had to go away, there was a cart with a white horse in front of her house, to take her luggage to the station." (Lizzi, he tells me, was a little girl who lived in a neighbouring house.) "Her father was standing near the horse, and the horse turned its head round (to touch him), and he said to Lizzi: '*Don't put your finger to the white horse or it'll bite you*'" Upon this I said: "I say, it strikes me that it isn't a horse you mean, but a widdler, that one mustn't put one's hand to."

¹ As to the meaning of his anxiety; not yet as to women having no widdlers.

² A suburb of Vienna where Hans's grandparents lived.

'He: "But a widdler doesn't bite."

'I: "Perhaps it does, though." He then went on eagerly to try and prove to me that it really was a white horse.¹

'On March 2nd, as he again showed signs of being afraid, I said to him: "Do you know what? This nonsense of yours" (that is how he speaks of his phobia) "will get better if you go for more walks. It's so bad now because you haven't been able to go out because you were ill."

'He: "Oh no, it's so bad because I still put my hand to my widdler every night."

Doctor and patient, father and son, were therefore at one in ascribing the chief share in the pathogenesis of Hans's present condition to his habit of masturbating. Indications were not wanting, however, of the presence of other significant factors.

'On March 3rd we got in a new maid, whom he is particularly pleased with. She lets him ride on her back while she cleans the floor, and so he always calls her "my horse", and holds on to her dress with cries of "Gee-up". On about March 10th he said to this new nursemaid: "If you do such-and-such a thing you'll have to undress altogether, and take off your chemise even." (He meant this as a punishment, but it is easy to recognize the wish behind it.)

'She: "And what'd be the harm? I'd just say to myself I haven't got any money to spend on clothes."

'He: "Why, it'd be shameful. People'd see your widdler." '

Here we have the same curiosity again, but directed on to a new object, and (appropriately to a period of repression) cloaked under a moralizing purpose.

'On March 13th in the morning I said to Hans: "You know, if you don't put your hand to your widdler any more, this nonsense of yours'll soon get better."

¹ Hans's father had no reason to doubt that it was a real event that the boy was describing. -I may also mention that the sensations of itching in the glans penis, which lead children to touch their genitals, are usually described by them in the phrase '*Es beisst mich*' ['I'm itching', literally 'it bites me'].

'Hans: "But I don't put my hand to my widdler any more."

': "But you still want to."

'Hans: "Yes, I do. But wanting's not doing, and doing's not wanting." (!!)

': "Well, but to prevent your wanting to, this evening you're going to have a bag to sleep in."

'After this we went out in front of the house. Hans was still afraid, but his spirits were visibly raised by the prospect of having his struggles made easier for him, and he said: "Oh, if I have a bag to sleep in my nonsense'll have gone to-morrow." And, in fact, he was *much* less afraid of horses, and was fairly calm when vehicles drove past.

'Hans had promised to go with me to Lainz the next Sunday, March 15th. He resisted at first, but finally went with me all the same. He obviously felt all right in the street, as there was not much traffic, and said: "How sensible! God's done away with horses now." On the way I explained to him that his sister has not got a widdler like him. Little girls and women, I said, have no widdlers: Mummy has none, Anna has none, and so on.

'Hans: "Have you got a widdler?"

': "Of course. Why, what do you suppose?"

'Hans (after a pause): "But how do little girls widdle, if they have no widdlers?"

': "They don't have widdlers like yours. Haven't you noticed already, when Hanna was being given her bath?"

'All day long he was in very high spirits, went tobogganing, and so on. It was only towards evening that he fell into low spirits again and seemed to be afraid of horses.

'That evening his attack of nerves and his need for being coaxed with were less pronounced than on previous days. Next day his mother took him with her into town and he was very much frightened in the streets. The day after, he stopped at home and was very cheerful. Next morning he woke up in a fright at about six o'clock. When he was asked what was the matter he said: "I put my finger to my widdler just a very little. I saw Mummy quite naked in her chemise, and she let me see her widdler. I showed Grete,¹ my Grete, what Mummy was doing, and showed her my widdler. Then I took my hand away from my widdler quick." When I objected that he could only mean "in her chemise" or "quite naked", Hans said: "She was in her chemise, but the chemise was so short that I saw her widdler."

This was none of it a dream, but a masturbatory phantasy, which was, however, equivalent to a dream. What he made his mother do was evidently intended as a piece of self-justification: 'If Mummy shows her widdler, I may too.'

We can gather two things from this phantasy: first, that his mother's reproof had produced a powerful result on him at the time it was made, and secondly, that the enlightenment he had been given to the effect that women have no widdlers was not accepted by him at first. He regretted that it should be so, and in his phantasy he stuck to his former view. He may also perhaps have had his reasons for refusing to believe his father for the moment.

¹ 'Grete is one of the little girls at Gmunden about whom Hans is having phantasies just now; he talks and plays with her.'

Weekly report from Hans's father. 'My dear Professor, I enclose the continuation of Hans's story - quite an interesting instalment. I shall perhaps take the liberty of calling upon you during your consulting hours on Monday and if possible of bringing Hans with me - assuming that he will come. I said to him to-day: "Will you come with me on Monday to see the Professor, who can take away your nonsense for you?"

'He: "No."

'I: "But he's got a very pretty little girl." - Upon which he willingly and gladly consented.

'Sunday, March 22nd. With a view to extending the Sunday programme, I proposed to Hans that we should go first to Schönbrunn, and only go on from there to Lainz at midday. He had, therefore, to make his way not only from our house to the Hauptzollamt station on the Stadtbahn, but also from the Hietzing station to Schönbrunn, and again from there to the Hietzing steam tramway station. And he managed all this, looking hurriedly away whenever any horses came along, for he was evidently feeling nervous. In looking away he was following a piece of advice given him by his mother.

'At Schönbrunn he showed signs of fear at animals which on other occasions he had looked at without any alarm. Thus he absolutely refused to go into the house in which the *giraffe* is kept, nor would he visit the elephant, which used formerly to amuse him a great deal. He was afraid of all the large animals, whereas he was very much entertained by the small ones. Among the birds, he was also afraid of the pelican this time - which had never happened before - evidently because of its size again.

'I therefore said to him: "Do you know why you're afraid of big animals? Big animals have big widdlers, and you're really afraid of big widdlers."

'Hans: "But I've never seen the big animals' widdlers yet."¹

'I: "But you *have* seen a horse's, and a horse is a big animal."

'Hans: "Oh, a horse's often. Once at Gmunden when the cart was standing at the door, and once in front of the Head Customs House."

'I: "When you were small, you most likely went into a stable at Gmunden . . ."

'Hans (interrupting): "Yes, I went into the stable every day at Gmunden when the horses had come home."

'I: ". . . and you were most likely frightened when you saw the horse's big widdler one time. But there's no need for you to be frightened of it. Big animals have big widdlers, and little animals have little widdlers."

'Hans: "And every one has a widdler. And my widdler will get bigger as I get bigger; it's fixed in, of course."

'Here the talk came to an end. During the next few days it seemed as though his fears had again somewhat increased. He hardly ventured out of the front door, to which he was taken after luncheon.'

¹ This was untrue. See his exclamation in front of the lions' cage on [p. 2005](#). It was probably the beginning of amnesia resulting from repression.

Hans's last words of comfort throw a light upon the situation and allow us to make some small corrections in his father's assertions. It is true that he was afraid of big animals because he was obliged to think of their big widdlers; but it cannot really be said that he was afraid of big widdlers themselves. Formerly the idea of them had been decidedly pleasurable to him, and he used to make every effort to get a glimpse of one. Since that time this enjoyment had been spoiled for him, owing to the general reversal of pleasure into unpleasure which had come over the whole of his sexual researches - in a way which has not yet been explained - and also owing to something which is clearer to us, namely, to certain experiences and reflections which had led to distressing conclusions. We may infer from his self-consolatory words ('my widdler will get bigger as I get bigger') that during his observations he had constantly been making comparisons, and that he had remained extremely dissatisfied with the size of his own widdler. Big animals reminded him of his defect, and were for that reason disagreeable to him. But since the whole train of thought was probably incapable of becoming clearly conscious, this distressing feeling, too, was transformed into anxiety, so that his present anxiety was erected both upon his former pleasure and his present unpleasure. When once a state of anxiety establishes itself, the anxiety swallows up all other feelings; with the progress of repression, and the more those ideas which are charged with affect and which have been conscious move down into the unconscious, all affects are capable of being changed into anxiety.

Hans's singular remark, 'it's fixed in, of course', makes it possible to guess many things in connection with his consolatory speech which he could not express in words and did not express during the course of the analysis. I shall bridge the gap for a little distance by means of my experiences in the analyses of grown-up people; but I hope the interpolation will not be considered arbitrary or capricious. 'It's fixed in, of course': if the motives of the thought were solace and defiance, we are reminded of his mother's old threat that she should have his widdler cut off if he went on playing with it. At the time it was made, when he was three and a half, this threat had no effect. He calmly replied that then he should widdle with his bottom. It would be the most completely typical procedure if the threat of castration were to have a *deferred* effect, and if he were now, a year and a quarter later, oppressed by the fear of having to lose this precious piece of his ego. In other cases of illness we can observe a similar deferred operation of commands and threats made in childhood, where the interval covers as many decades or more. I even know cases in which a 'deferred obedience' under the influence of repression has had a principal share in determining the symptoms of the disease.

The piece of enlightenment which Hans had been given a short time before to the effect that women really do not possess a widdler was bound to have had a shattering effect upon his self-confidence and to have aroused his castration complex. For this reason he resisted the information, and for this reason it had no therapeutic results. Could it be that living beings really did exist which did not possess widdlers? If so, it would no longer be so incredible that they could take his own widdler away, and, as it were, make him into a woman!¹

¹ I cannot interrupt the discussion so far as to demonstrate the typical character of the unconscious train of thought which I think there is here reason for attributing to little Hans. The castration complex is the deepest unconscious root of anti-semitism; for even in the nursery little boys hear that a Jew has something cut off his penis - a piece of his penis, they think - and this gives them a right to despise Jews. And there is no stronger unconscious root for the sense of superiority over women. Weininger (the young philosopher who, highly gifted but sexually deranged, committed suicide after producing his remarkable book, *Geschlecht und Charakter*), in a chapter that attracted much attention, treated Jews and women with equal hostility and overwhelmed them with the same insults. Being a neurotic, Weininger was completely under the sway of his infantile complexes; and from that standpoint what is common to Jews and women is their relation to the castration complex.

'During the night of 27th-28th Hans surprised us by getting out of bed while it was quite dark and coming into our bed. His room is separated from our bedroom by another small room. We asked him why: whether he had been afraid, perhaps. "No," he said; "I'll tell you to-morrow." He went to sleep in our bed and was then carried back to his own.

'Next day I questioned him closely to discover why he had come in to us during the night; and after some reluctance the following dialogue took place, which I immediately took down in shorthand:

'He: "In the night there was a big giraffe in the room and a crumpled one; and the big one called out because I took the crumpled one away from it. Then it stopped calling out; and then I sat on top of the crumpled one."

'I (puzzled): "What? A crumpled giraffe? How was that?"

'He: "Yes." (He quickly fetched a piece of paper, crumpled it up, and said:) "It was crumpled like that."

'I: "And you sat down on top of the crumpled giraffe? How?"

'He again showed me, by sitting down on the ground.

'I: "Why did you come into our room?"

'He: "I don't know myself."

'I: "Were you afraid?"

'He: "No. Of course not."

'I: "Did you dream about the giraffe?"

'He: "No. I didn't dream. I thought it. I thought it all. I'd woken up earlier."

'I: "What can it mean: a crumpled giraffe? You know you can't squash a giraffe together like a piece of paper."

'He: "Of course I know. I just thought it. Of course there aren't any really and truly.¹ The crumpled one was all lying on the floor, and I took it away - took hold of it with my hands."

'I: "What? Can you take hold of a big giraffe like that with your hands?"

'He: "I took hold of the crumpled one with my hand."

'I: "Where was the big one meanwhile?"

'He: "The big one just stood farther off."

'I: "What did you do with the crumpled one?"

'He: "I held it in my hand for a bit, till the big one had stopped calling out. And when the big one had stopped calling out, I sat down on top of it."

¹ In his own language Hans was saying quite definitely that it was a phantasy.

'I: "Why did the big one call out?"

'He: "Because I'd taken away the little one from it." (He noticed that I was taking everything down, and asked:) "Why are you writing that down?"

'I: "Because I shall send it to a Professor, who can take away your 'nonsense' for you."

'He: "Oho! So you've written down as well that Mummy took off her chemise, and you'll give that to the Professor too."

'I: "Yes. But he won't understand how you can think that a giraffe can be crumpled up."

'He: 'Just tell him I don't know myself, and then he won't ask. But if he asks what the crumpled giraffe is, then he can write to us, and we can write back, or let's write at once that I don't know myself."

'I: "But why did you come in in the night?"

'He: "I don't know."

'I: "Just tell me quickly what you're thinking of."

'He (jokingly): "Of raspberry syrup."

'I: "What else?" } His wishes.

'He: "A gun for shooting people dead with."¹

'I: "You're sure you didn't dream it?"

'He: "Quite sure; no, I'm quite certain of it."

'He proceeded: "Mummy begged me so long to tell her why I came in in the night. But I didn't want to say, because I felt ashamed with Mummy at first."

'I: "Why?"

'He: "I didn't know."

'My wife had in fact examined him all the morning, till he had told her the giraffe story.'

¹ At this point his father in his perplexity was trying to practise the classical technique of psycho-analysis. This did not lead to much; but the result, such as it was, can be given a meaning in the light of later disclosures.

That same day his father discovered the solution of the giraffe phantasy.

'The big giraffe is myself, or rather my big penis (the long neck), and the crumpled giraffe is my wife, or rather her genital organ. It is therefore the result of the enlightenment he has had.

'Giraffe: see the expedition to Schönbrunn. Moreover, he has a picture of a giraffe and an elephant hanging over his bed.

'The whole thing is a reproduction of a scene which has been gone through almost every morning for the last few days. Hans always comes in to us in the early morning, and my wife cannot resist taking him into bed with her for a few minutes. Thereupon I always begin to warn her not to take him into bed with her ("the big one called out because I'd taken the crumpled one away from it"); and she answers now and then, rather irritated, no doubt, that it's all nonsense, that after all one minute is of no importance, and so on. Then Hans stays with her a little while. ("Then the big giraffe stopped calling out; and there I sat down on top of the crumpled one.")

'Thus the solution of this matrimonial scene transposed into giraffe life is this: he was seized in the night with a longing for his mother, for her caresses, for her genital organ, and came into our bedroom for that reason. The whole thing is a continuation of his fear of horses.'

I have only this to add to his father's penetrating interpretation. The '*sitting down on top of*' was probably Hans's representation of taking *possession*. But the whole thing was a phantasy of defiance connected with his satisfaction at the triumph over his father's resistance. 'Call out as much as you like! But Mummy takes me into bed all the same, and Mummy belongs to me!' It is therefore justifiable, as his father suspected, to divine behind the phantasy a fear that his mother did not like him, because his widdler was not comparable to his father's.

Next morning his father was able to get his interpretation confirmed.

'On Sunday, March 29th, I went with Hans to Lainz. I jokingly took leave of my wife at the door with the words: "Good-bye, big giraffe!" "Why giraffe?" asked Hans. "Mummy's the big giraffe," I replied; to which Hans rejoined: "Oh yes! And Hanna's the crumpled giraffe, isn't she?"

'In the train I explained the giraffe phantasy to him, upon which he said: "Yes, that's right." And when I said to him that I was the big giraffe, and that its long neck had reminded him of a widdler, he said: "Mummy has a neck like a giraffe, too. I saw, when she was washing her white neck."¹

'On Monday, March 30th, in the morning, Hans came to me and said: "I say! I thought two things this morning!" "What was the first?" "I was with you at Schönbrunn where the sheep are; and then we crawled through under the ropes, and then we told the policeman at the end of the garden, and he grabbed hold of us." He had forgotten the second thing.

'I can add the following comment on this. When we wanted to visit the sheep on Sunday, we found that a space in the gardens was shut off by a rope, so that we were unable to get to them. Hans was very much astonished that the space should be shut off only with a rope, which it would be quite easy to slip under. I told him that respectable people didn't crawl under the rope. He said it would be quite easy; whereupon I replied that a policeman might come along and take one off. There is a lifeguardsman on duty at the entrance of Schönbrunn; and I once told Hans that he arrested naughty children.

'After we returned from our visit to you, which took place the same day, Hans confessed to yet another little bit of craving to do something forbidden: "I say, I thought something this morning again." "What?" "I went with you in the train, and we smashed a window and the policeman took us off with him."

A most suitable continuation of the giraffe phantasy. He had a suspicion that to take possession of his mother was forbidden; he had come up against the barrier against incest. But he regarded it as forbidden *in itself*. His father was with him each time in the forbidden exploits which he carried out in his imagination, and was locked up with him. His father, he thought, also did that enigmatic forbidden something with his mother which he replaced by an act of violence such as smashing a window-pane or forcing a way into an enclosed space.

¹ Hans only confirmed the interpretation of the two giraffes as his father and mother, and not the sexual symbolism, according to which the giraffe itself represented the penis. This symbolism was probably correct, but we really cannot ask more of Hans.

That afternoon the father and son visited me during my consulting hours. I already knew the funny little fellow, and with all his self-assurance he was yet so amiable that I had always been glad to see him. I do not know whether he remembered me, but he behaved irreproachably and like a perfectly reasonable member of human society. The consultation was a short one. His father opened it by remarking that, in spite of all the pieces of enlightenment we had given Hans, his fear of horses had not yet diminished. We were also forced to confess that the connections between the horses he was afraid of and the affectionate feelings towards his mother which had been revealed were by no means abundant. Certain details which I now learnt - to the effect that he was particularly bothered by what horses wear in front of their eyes and by the black round their mouths - were certainly not to be explained from what we knew. But as I saw the two of them sitting in front of me and at the same time heard Hans's description of his anxiety-horses, a further piece of the solution shot through my mind, and a piece which I could well understand might escape his father. I asked Hans jokingly whether his horses wore eyeglasses, to which he replied that they did not. I then asked him whether his father wore eyeglasses, to which, against all the evidence, he once more said no. Finally I asked him whether by 'the black round the mouth' he meant a moustache; and I then disclosed to him that he was afraid of his father, precisely because he was so fond of his mother. It must be, I told him, that he thought his father was angry with him on that account; but this was not so, his father was fond of him in spite of it, and he might admit everything to him without any fear. Long before he was in the world, I went on, I had known that a little Hans would come who would be so fond of his mother that he would be bound to feel afraid of his father because of it; and I had told his father this. 'But why do you think I'm angry with you?' his father interrupted me at this point; 'have I ever scolded you or hit you?' Hans corrected him: 'Oh yes! You have hit me.' 'That's not true. When was it, anyhow?' 'This morning,' answered the little boy; and his father recollected that Hans had quite unexpectedly butted his head into his stomach, so that he had given him as it were a reflex blow with his hand. It was remarkable that he had not brought this detail into connection with the neurosis; but he now recognized it as an expression of the little boy's hostile disposition towards him, and perhaps also as a manifestation of a need for getting punished for it.¹

¹ Later on the boy repeated his reaction towards his father in a clearer and more complete manner, by first hitting his father on the hand and then affectionately kissing the same hand.

'Does the Professor talk to God,' Hans asked his father on the way home, 'as he can tell all that beforehand?' I should be extraordinarily proud of this recognition out of the mouth of a child, if I had not myself provoked it by my joking boastfulness. From the date of this consultation I received almost daily reports of the alterations in the little patient's condition. It was not to be expected that he should be freed from his anxiety at a single blow by the information I gave him; but it became apparent that a possibility had now been offered him of bringing forward his unconscious productions and of unfolding his phobia. From that time forward he carried out a programme which I was able to announce to his father in advance.

'April 2nd. The *first real improvement* is to be noted. While formerly he could never be induced to go out of the street door for very long, and always ran back into the house with every sign of fright if horses came along, this time he stayed in front of the street-door for an hour - even while carts were driving past, which happens fairly often in our street. Every now and then he ran into the house when he saw a cart approaching in the distance, but he turned round at once as though he were changing his mind. In any case there is only a trace of the anxiety left, and the progress since his enlightenment is unmistakable.

'In the evening he said: "We get as far as the street-door now, so we'll go into the Stadtpark too."

'On April 3rd, in the morning he came into bed with me, whereas for the last few days he had not been coming any more and had even seemed to be proud of not doing so. "And why have you come to-day?" I asked.

'Hans: "When I'm not frightened I shan't come any more."

'I: "So you come in to me because you're frightened?"

'Hans: "When I'm not with you I'm frightened; when I'm not in bed with you, then I'm frightened. When I'm not frightened any more I shan't come any more."

I: "So you're fond of me and you feel anxious when you're in your bed in the morning? and that's why you come in to me?"

Hans: "Yes. Why did you tell me I'm fond of *Mummy* and that's why I'm frightened, when I'm fond of *you*?"

Here the little boy was displaying a really unusual degree of clarity. He was bringing to notice the fact that his love for his father was wrestling with his hostility towards him in his capacity of rival with his mother; and he was reproaching his father with not having yet drawn his attention to this interplay of forces, which was bound to end in anxiety. His father did not entirely understand him as yet, for during this conversation he only succeeded in convincing himself of the little boy's hostility towards him, the existence of which I had asserted during our consultation. The following dialogue, which I nevertheless give without alteration, is really of more importance in connection with the progress of the father's enlightenment than with the little patient.

'Unfortunately I did not immediately grasp the meaning of this reproach. Because Hans is fond of his mother he evidently wants to get me out of the way, and he would then be in his father's place. This suppressed hostile wish is turned into anxiety *about* his father, and he comes in to me in the morning to see if I have gone away. Unfortunately at the moment I did not understand this, and said to him:

"When you're alone, you're just anxious for me and come in to me."

'Hans: "When you're away, I'm afraid you're not coming home."

': "And have I ever threatened you that I shan't come home?"

'Hans: "Not you, but Mummy. Mummy's told me she won't come back." (He had probably been naughty, and she had threatened to go away.)

': "She said that because you were naughty."

'Hans: "Yes."

': "So you're afraid I'm going away because you were naughty; that's why you come in to me."

'When I got up from table after breakfast Hans said: "Daddy, don't trot away from me!" I was struck by his saying "trot" instead of "run", and replied: "Oho! So you're afraid of the horse trotting away from you." Upon which he laughed.'

We know that this portion of Hans's anxiety had two constituents: there was fear *of* his father and fear *for* his father. The former was derived from his hostility towards his father, and the latter from the conflict between his affection, which was exaggerated at this point by way of compensation, and his hostility.

His father proceeds: 'This is no doubt the beginning of an important phase. His motive for at the most just venturing outside the house but not going away from it, and for turning round at the first attack of anxiety when he is half-way, is his fear of not finding his parents at home because they have gone away. He sticks to the house from love of his mother, and he is afraid of my going away because of the hostile wishes that he nourishes against me - for then *he* would be the father.

'In the summer I used to be constantly leaving Gmunden for Vienna on business, and he was then the father. You will remember that his fear of horses is connected with the episode at Gmunden when a horse was to take Lizzi's luggage to the station. The repressed wish that I should drive to the station, for then he would be alone with his mother (the wish that "the horse should drive off"), is turned into fear of the horse's driving off; and in fact nothing throws him into greater alarm than when a cart drives off from the courtyard of the Head Customs House (which is just opposite our flat) and the horses start moving.

'This new phase (hostile sentiments towards his father) could only come out after he knew that I was not angry because he was so fond of his mother.

'In the afternoon I went out in front of the street-door with him again; he again went out in front of the house, and stayed there even when carts went past. In the case of a few carts only he was afraid, and ran into the entrance-hall. He also said to me in explanation: "Not all white horses bite." That is to say: owing to the analysis some white horses have already been recognized as "Daddy", and they no longer bite; but there are others still left over which *do* bite.

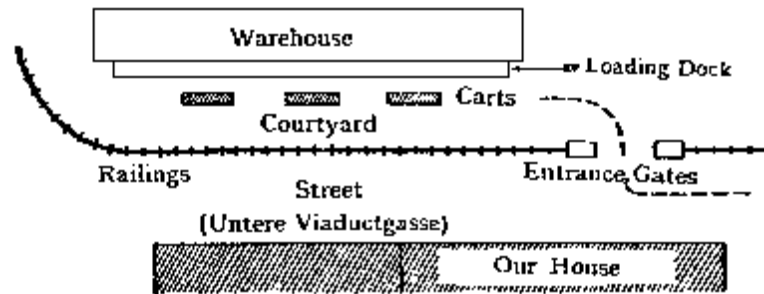

Fig. 2.

'The position of our street-door is as follows: Opposite it is the warehouse of the Office for the Taxation of Food-Stuffs, with a loading dock at which carts are driving up all day long to fetch away boxes, packing-cases, etc. This courtyard is cut off from the street by railings; and the entrance gates to the courtyard are opposite our house (Fig. 2). I have noticed for some days that Hans is specially frightened when carts drive into or out of the yard, a process which involves their taking a corner. I asked at the time why he was so much afraid, and he replied: "*I'm afraid the horses will fall down when the cart turns*" (a). He is equally frightened when carts standing at the loading dock start moving in order to drive off (b). Further (c), he is more frightened of large dray-horses than of small horses, and of rough farm-horses than of smart horses (such as those in a carriage and pair). He is also more frightened when a vehicle drives past quickly (d) than when the horses trot up slowly. These differentiations have, of course, only come to light clearly during the last few days.'

I should be inclined to say that, in consequence of the analysis, not only the patient but his phobia too had plucked up courage and was venturing to show itself.

'On April 5th Hans came in to our bedroom again, and was sent back to his own bed. I said to him: "As long as you come into our room in the mornings, your fear of horses won't get better." He was defiant, however, and replied: "I shall come in all the same, even if I *am* afraid." So he will not let himself be forbidden to visit his mother.

'After breakfast we were to go downstairs. Hans was delighted, and planned that, instead of stopping in front of the street-door as usual, he should go across the street into the yard, where he had often enough seen street-boys playing. I told him I should be pleased if he were to go across, and took the opportunity of asking him why he is so much afraid when the loaded carts at the loading dock start moving (*b*).

'*Hans*: "I'm afraid of standing by the cart and the cart driving off quick, and of my standing on it and wanting to get on to the board (the loading dock), and my driving off in the cart."

'*I*: 'And if the cart stands still? Aren't you afraid then? Why not?"

'*Hans*: "If the cart stands still, then I can get on to the cart quick and get on to the board."

'(So Hans is planning to climb over a cart on to the loading dock, and is afraid of the cart driving away while he is on it.)

'*I*: "Perhaps you're afraid you won't come home any more if you drive away in the cart?"

Fig. 3.

Hans: "Oh no! I can always come back to Mummy, in the cart or in a cab. I can tell him the number of the house too."

I: "Then why are you afraid?"

Hans: "I don't know. But the Professor'll know. D'you think he'll know?"

I: "And why do you want to get over on to the board?"

Hans: "Because I've never been up there, and I should so much like to be there; and d'you know why I should like to go there? Because I should like to load and unload the boxes, and I should like to climb about on the boxes there. I should so like to climb about there. D'you know who I learnt the climbing about from? Some boys climbed on the boxes, and I saw them, and I want to do it too."

'His wish was not fulfilled. For when Hans ventured once more in front of the street-door, the few steps across the street and into the courtyard awoke too great resistances in him, because carts were constantly driving into the yard.'

The Professor only knows that the game which Hans intended to play with the loaded carts must have stood in the relation of a symbolic substitute to some other wish as to which he had so far uttered no word. But, if it did not seem too daring, this wish might already, even at this stage, be constructed.

'In the afternoon we again went out in front of the street door, and when I returned I asked Hans:
 "'Which horses are you actually most afraid of?"
 'Hans: "All of them."
 'I: "That's not true."
 'Hans: "I'm most afraid of horses with a thing on their mouths."
 'I: "What do you mean? The piece of iron they have in their mouths?"
 'Hans: "No. They have something black on their mouths." (He covered his mouth with his hand.)
 'I: "What? A moustache, perhaps?"
 'Hans (laughing): "Oh no!"
 'I: "Have they all got it?"
 'Hans: "No, only a few of them."
 'I: "What is it that they've got on their mouths?"
 'Hans: "A black thing." (I think in reality it must be the thick piece of harness that dray-horses wear over their noses.)

Fig. 4.

"And I'm most afraid of furniture-vans, too."
 'I: "Why?"
 'Hans: "I think when furniture-horses are dragging a heavy van they'll fall down."
 'I: "So you're not afraid with a small cart?"
 'Hans: "No. I'm not afraid with a small cart or with a post-office van. I'm most afraid too when a bus comes along."
 'I: "Why? Because its so big?"
 'Hans: "No. Because once a horse in a bus fell down."
 'I: "When?"
 'Hans: "Once when I went out with Mummy in spite of my 'nonsense', when I bought the waistcoat." (This was subsequently confirmed by his mother.)
 'I: "What did you think when the horse fell down?"
 'Hans: "Now it'll always be like this. All horses in buses'll fall down."
 'I: "In all buses?"

'Hans: "Yes. And in furniture-vans too. Not often in furniture-vans."

': "You had your nonsense already at that time?"

'Hans: "No. I only got it then. When the horse in the bus fell down, it gave me such a fright, really! That was when I got the nonsense."

': "But the nonsense was that you thought a horse would bite you. And now you say you were afraid a horse would fall down."

'Hans: "Fall down and bite."¹

': "Why did it give you such a fright?"

'Hans: "Because the horse went like this with its feet," (He lay down on the ground and showed me how it kicked about.) "It gave me a fright *because it made a row with its feet.*"

': "Where did you go with Mummy that day?"

'Hans: "First to the Skating Rink, then to a *café*, then to buy a waistcoat, then to the pastry-cook's with Mummy, and then home in the evening; we went back through the Stadtpark." (All of this was confirmed by my wife, as well as the fact that the anxiety broke out immediately afterwards.)

': "Was the horse dead when it fell down?"

'Hans: Yes!"

': "How do you know that?"

'Hans: "Because I saw it." (He laughed.) "No, it wasn't a bit dead."

': "Perhaps you thought it was dead?"

'Hans: "No. Certainly not. I only said it as a joke." (His expression at the moment, however, had been serious.)

'As he was tired, I let him run off. He only told me besides this that he had first been afraid of bus-horses, then of all others, and only in the end of furniture-van horses.

¹ Hans was right, however improbable this collocation may sound. The train of thought, as we shall see, was that the horse (his father) would bite him because of his wish that it (his father) should fall down.

'On the way back from Lainz there were a few more questions:

'I: "When the bus-horse fell down, what colour was it: white, red, brown, grey?"

'Hans: "Black. Both horses were black."

'I: "Was it big or little?"

'Hans: "Big."

'I: "Fat or thin?"

'Hans: "Fat. Very big and fat."

'I: "When the horse fell down, did you think of your daddy?"

'Hans: "Perhaps. Yes. It's possible."

His father's investigations may have been without success at some points; but it does no harm to make acquaintance at close quarters with a phobia of this sort - which we may feel inclined to name after its new objects. For in this way we get to see how diffuse it really is. It extends on to horses and on to carts, on to the fact that horses fall down and that they bite, on to horses of a particular character, on to carts that are heavily loaded. I will reveal at once that all these characteristics were derived from the circumstance that the anxiety originally had no reference at all to horses but was transposed on to them secondarily and had now become fixed upon those elements of the horse-complex which showed themselves well adapted for certain transferences. We must specially acknowledge one most important result of the boy's examination by his father. We have learned the immediate precipitating cause after which the phobia broke out. This was when the boy saw a big heavy horse fall down; and one at least of the interpretations of this impression seems to be that emphasized by his father, namely, that Hans at that moment perceived a wish that his father might fall down in the same way - and be dead. His serious expression as he was telling the story no doubt referred to this unconscious meaning. May there not have been yet another meaning concealed behind all this? And what can have been the significance of the making a row with its legs?

'For some time Hans has been playing horses in the room; he trots about, falls down, kicks about with his feet, and neighs. Once he tied a small bag on like a nose-bag. He has repeatedly run up to me and bitten me.'

In this way he was accepting the last interpretations more decidedly than he could in words, but naturally with a change of parts, for the game was played in obedience to a wishful phantasy. Thus *he* was the horse, and bit his father, and in this way was identifying himself with his father.

'I have noticed for the last two days that Hans has been defying me in the most decided manner, not impudently, but in the highest spirits. Is it because he is no longer afraid of me - the horse?

'April 6th. Went out with Hans in front of the house in the afternoon. At every horse that passed I asked him if he saw the "black on its mouth"; he said "no" every time. I asked him what the black really looked like; he said it was black iron. My first idea, that he meant the thick leather straps that are part of the harness of dray-horses, is therefore unconfirmed. I asked him if the "black" reminded him of a moustache, and he said: "Only by its colour." So I do not yet know what it really is.

'The fear has diminished; this time he ventured as far as the next-door house, but turned round quickly when he heard the sound of horses' hooves in the distance. When a cart drew up at our door and came to a stop, he became frightened and ran into the house, because the horse began pawing with its foot. I asked him why he was afraid, and whether perhaps he was nervous because the horse had done like this (and I stamped with my foot). He said: "Don't make such a row with your feet!" Compare his remark about the fallen bus-horse.

'He was particularly terrified by a furniture-van passing by. At that he ran right inside the house. "Doesn't a furniture-van like that," I asked him unconcernedly, "really look like a bus?" He said nothing. I repeated the question, and he then said: "Why, of course! Otherwise I shouldn't be so afraid of a furniture-van."

'April 7th. I asked again to-day what the "black on the horses' mouths" looked like. Hans said: "Like a muzzle." The curious thing is that for the last three days not a single horse has passed on which he could point out this "muzzle". I myself have seen no such horse on any of my walks, although Hans asseverates that such horses do exist. I suspect that some sort of horses' bridle - the thick piece of harness round their mouths, perhaps - really reminded him of a moustache, and that after I alluded to this this fear disappeared as well.

'Hans's improvement is constant. The radius of his circle of activity with the street-door as its centre grows ever wider. He has even accomplished the feat, which has hitherto been impossible for him, of running across to the pavement opposite. All the fear that remains is connected with the bus scene, the meaning of which is not yet clear to me.

'April 9th. This morning Hans came in to me while I was washing and bare to the waist.

'Hans: "Daddy, you *are* lovely! You're so white."

': "Yes. Like a white horse."

'Hans: "The only black thing's your moustache." (Continuing) "Or perhaps it's a black muzzle?"

'I told him then that I had been to see the Professor the evening before, and said: "There's one thing he wants to know." "I *am* curious," remarked Hans.

'I told him I knew on what occasions it was that he made a row with his feet. "Oh, yes!" he interrupted me, "when I'm cross, or when I have to do 'lumf' and would rather play." (He has a habit, it is true, of making a row with his feet, i.e. of stamping, when he is angry. - "Doing lumf" means doing number two. When Hans was small he said one day when he got off the chamber: "Look at the lumf [German: '*Lumpf*']." He meant "stocking" [German: "*Strumpf*"], because of its shape and colour. This designation has been preserved to this day. - In very early days, when he had to be put on the chamber, and refused to leave off playing, he used to stamp his feet in a rage, and kick about, and sometimes throw himself on the ground.)

"And you kick about with your feet as well, when you have to widdle and don't want to go, because you'd rather go on playing."

'He: "Oh, I must widdle." And he went out of the room by way of confirmation, no doubt.'

In the course of his visit his father had asked me what Hans could have been reminded of by the fallen horse kicking about with its feet. I had suggested that that may have been his own reaction when he retained his urine. Hans now confirmed this by means of the re-emergence during the conversation of a desire to micturate; and he added some other meanings of the making a row with the feet.

'We then went out in front of the street-door. When a coal-cart came along, he said to me: "Daddy, I'm very much afraid of coal-carts, too."

': "Perhaps that's because they're as big as buses, too."

'Hans: "Yes; and because they're so heavily loaded, and the horses have so much to drag and might easily fall down. If a cart's empty, I'm not afraid." It is a fact, as I have already remarked, that only heavy vehicles throw him into a state of anxiety.'

Nevertheless, the situation was decidedly obscure. The analysis was making little progress; and I am afraid the reader will soon begin to find this description of it tedious. Every analysis, however, has dark periods of this kind. But Hans was now on the point of leading us into an unexpected region.

'I came home and was speaking to my wife, who had made various purchases which she was showing me. Among them was a pair of yellow ladies' drawers. Hans exclaimed "Ugh!" two or three times, threw himself on the ground, and spat. My wife said he had done this two or three times already when he had seen the drawers.

"Why do you say 'Ugh'?" I asked.

'Hans: "Because of the drawers."

'I: "Why? Because of their colour? Because they're yellow?', and remind you of lumf or widdle?"

'Hans: "Lumf isn't yellow. It's white or black." - Immediately afterwards: "I say, is it easy to do lumf if you eat cheese?" (I had once told him so, when he asked me why I ate cheese.)

'I: "Yes."

'Hans: "That's why you go straight off every morning and do lumf? I should so much like to eat cheese with my bread-and-butter."

'He had already asked me yesterday as he was jumping about in the street: "I say, it's true, isn't it, if you jump about a lot you can do lumf easily?" - There has been trouble with his stools from the very first; and aperients and enemas have frequently been necessary. At one time his habitual constipation was so great that my wife called in Dr. L. He was of opinion that Hans was overfed, which was in fact the case, and recommended a more moderate diet - and the condition was at once brought to an end. Recently the constipation has again made its appearance more frequently.

'After luncheon I said to him: "We'll write to the Professor again," and he dictated to me: "When I saw the yellow drawers I said 'Ugh! that makes me spit!' and threw myself down and shut my eyes and didn't look."

'I: "Why?"

'Hans: "Because I saw the yellow drawers; and I did the same sort of thing with the black drawers too.¹ The black ones are the same sort of drawers, only they were black." (Interrupting himself) "I say, I *am* glad. I'm always so glad when I can write to the Professor."

'I: "Why did you say 'Ugh'? Were you disgusted?"

'Hans: "Yes, because I saw that. I thought I should have to do lumpf."

'I: "Why?"

'Hans: "I don't know."

'I: "When did you see the black drawers?"

'Hans: "Once, when Anna (our maid) had been here a long time - with Mummy - she brought them home just after she'd bought them." (This statement was confirmed by my wife.)

'I: "Were you disgusted then, too?"

'Hans: "Yes."

'I: "Have you seen Mummy in drawers like that?"

'Hans: "No."

'I: "When she was dressing?"

'Hans: "When she bought the yellow ones I'd seen them once before already." (This is contradicted. He saw the yellow ones for the first time when his mother bought them.) "She's got the black ones on to-day too" (correct), "because I saw her take them off in the morning."

¹ 'For the last few weeks my wife has possessed a pair of black bloomers for wearing on cycling tours.'

'I: "What? She took off the black drawers in the morning?"

'Hans: "In the morning when she went out she took off the black drawers, and when she came back she put the black ones on again."

'I asked my wife about this, as it seemed to me absurd. She said it was entirely untrue. Of course she had not changed her drawers when she went out.

'I at once asked Hans about it: "You told me that Mummy had put on some black drawers, and that when she went out she took them off, and that when she came back she put them on again. But Mummy says it's not true."

'Hans: "I think perhaps I may have forgotten she didn't take them off." (Impatiently) "Oh, do let me alone."

I have a few comments to make at this point on the business of the drawers. It was obviously mere hypocrisy on Hans's part to pretend to be so glad of the opportunity of giving an account of the affair. In the end he threw the mask aside and was rude to his father. It was a question of things which had once afforded him *a great deal of pleasure*, but of which, now that repression had set in, he was very much ashamed, and at which he professed to be disgusted. He told some downright lies so as to disguise the circumstances in which he had seen his mother change her drawers. In reality, the putting on and taking off of her drawers belonged to the 'lumpf' context. His father was perfectly aware of what it was all about and of what Hans was trying to conceal.

'I asked my wife whether Hans was often with her when she went to the W.C. "Yes," she said, "often. He goes on pestering me till I let him. Children are all like that."

Nevertheless, it is worth bearing carefully in mind the desire, which Hans had already repressed, for seeing his mother doing lumpf.

'We went out in front of the house. He was in very good spirits and was prancing about all the time like a horse. So I said: "Now, who is it that's the bus-horse? Me, you or Mummy?"

'Hans (promptly): "I am; I'm a young horse."

'During the period when his anxiety was at its height, and he was frightened at seeing horses frisking, he asked me why they did it; and to reassure him I said: "Those are young horses, you see, and they frisk about like little boys. You frisk about too, and you're a little boy." Since then, whenever he has seen horses frisking, he has said: "That's right; those are young horses!"

'As we were going upstairs I asked him almost without thinking: "Used you to play at horses with the children at Gmunden?"

'He: "Yes." (Thoughtfully) "I think that was how I got the nonsense."

'I: "Who was the horse?"

'He: "I was; and Berta was the coachman."

'I: "Did you fall down by any chance, when you were a horse?"

'Hans: "No. When Berta said 'Gee-up', I ran ever so quick; I just raced along."¹

'I: "You never played at buses?"

'Hans: "No. At ordinary carts, and horses without carts. When a horse has a cart, it can go without a cart just as well, and the cart can stay at home."

'I: "Used you often to play at horses?"

'Hans: "Very often. Fritzl² was the horse once, too, and Franzl the coachman; and Fritzl ran ever so fast and all at once he hit his foot on a stone and bled."

'I: "Perhaps he fell down?"

¹ 'Hans had a set of toy harness with bells.'

² Another of the landlord's children, as we already know.

'Hans: "No. He put his foot in some water and then wrapped it up."¹

'I: "Were you often the horse?"

'Hans: "Oh, yes."

'I: "And that was how you got the nonsense?"

'Hans: "Because they kept on saying ' 'cos of the horse, ' 'cos of the horse' " (he put a stress on the 'cos'); "so perhaps I got the nonsense because they talked like that; 'cos of the horse.'"²

For a while Hans's father pursued his enquiry fruitlessly along other paths.

'I: "Did they tell you anything about horses?"

'Hans: "Yes."

'I: "What?"

'Hans: "I've forgotten."

'I: "Perhaps they told you about their widdlers?"

'Hans: "Oh, no."

'I: "Were you frightened of horses already then?"

'Hans: "Oh, no. I wasn't frightened at all."

'I: "Perhaps Berta told you that horses ---?"

'Hans (interrupting): "---widdle? No."

¹ See below. His father was quite right in suspecting that Fritzl fell down.

² [*Wegen dem Pferd*]. I may explain that Hans was not maintaining that he had got the nonsense *at that time* but *in that connection*. Indeed, it must have been so, for theoretical considerations require that what is to-day the object of a phobia must at one time in the past have been the source of a high degree of pleasure. I may at the same time complete what the child was unable to express, and add that the little word '*wegen*' ['because of', ' 'cos of'] was the means of enabling the phobia to extend from horses on to '*Wagen*' ['vehicles'] or, as Hans was accustomed to pronounce the word and hear it pronounced, '*Wägen*' [pronounced exactly like '*wegen*']. It must never be forgotten how much more concretely children treat words than grown-up people do, and consequently how much more significant for them are similarities of sound in words.

'On April 10th I took up our conversation of the day before, and tried to discover what his "'cos of the horse" meant. Hans could not remember; he only knew that some children had stood outside the front door one morning and had said, "'cos of the horse, 'cos of the horse!" He had been there himself. When I pressed him more closely, he declared that they had not said "'cos of the horse" at all, but that he had remembered wrong.

'I: "But you and the others were often in the stables. You must surely have talked about horses there." - "We didn't." - "What did you talk about?" - "Nothing." - "Such a lot of children, and nothing to talk about?" - "We did talk about something, but not about horses." - "Well, what was it?" - "I don't remember any more."

'I allowed the matter to drop, as the resistances were evidently too great,¹ and went on to the following question: "Did you like playing with Berta?"

'He: "Yes, very much; but not with Olga. D'you know what Olga did? I was given a paper ball once by Grete up there at Gmunden, and Olga tore it all to pieces. Berta would never have torn my ball. I liked playing with Berta very much."

'I: "Did you see what Berta's widdler looked like?"

'He: "No, but I saw the horses'; because I was always in the stables, and so I saw the horses' widdlers."

'I: "And so you were curious and wanted to know what Berta's and Mummy's widdlers looked like?"

'He: "Yes."

'I reminded him of how he had once complained to me that the little girls always wanted to look on while he was widdling.

¹ In point of fact there was nothing more to be got out of it than Hans's verbal association, and this had escaped his father. Here is a good instance of conditions under which an analyst's efforts are wasted.

'He: "Berta always looked on at me too" (he spoke with great satisfaction and not at all resentfully); "often she did, I used to widdle in the little garden where the radishes were, and she stood outside the front door and looked on at me."

'I: "And when she widdled, did you look on?"

'He: "She used to go to the W.C."

'I: "And you were curious?"

'He: "I was inside the W.C. when she was in it."

(This was a fact. The servants told us about it once, and I recollect that we forbade Hans to do it.)

'I: "Did you tell her you wanted to go in?"

'He: "I went in alone and because Berta let me. There's nothing shameful in that."

'I: "And you'd have liked to see her widdler?"

'He: "Yes, but I didn't see it."

'I then reminded him of the dream about playing forfeits that he had had at Gmunden, and said: "When you were at Gmunden did you want Berta to make you widdle?"

'He: "I never said so to her."

'I: "Why didn't you ever say so to her?"

'He: "Because I didn't think of it." (Interrupting himself) "If I write everything to the Professor, my nonsense'll soon be over, won't it?"

'I: "Why did you want Berta to make you widdle?"

'He: "I don't know. Because she looked on at me."

'I: "Did you think to yourself she should put her hand to your widdler?"

'He: "Yes." (Changing the subject)("It was such fun at Gmunden. In the little garden where the radishes were there was a little sand-heap; I used to play there with my spade."

(This was the garden where he used always to widdle.)

"I: 'Did you put your hand to your widdler at Gmunden, when you were in bed?"

'He: "No. Not then; I slept so well at Gmunden that I never thought of it at all. The only times I did it was at --- Street¹ and now."

'I: "But Berta never put her hand to your widdler?"

'He: "She never did, no; because I never told her to."

'I: "Well, and when was it you wanted her to?"

'He: "Oh, at Gmunden once."

'I: "Only once?"

'He: "Well, now and then."

'I: "She used always to look on at you when you widdled; perhaps she was curious to know how you did it?"

'He: "Perhaps she was curious to know what my widdler looked like."

'I: "But you were curious too. Only about Berta?"

'He: "About Berta, and about Olga."

'I: "About who else?"

'He: "About no one else."

'I: "You know that's not true. About Mummy too."

'He: "Oh, yes, about Mummy."

'I: "But now you're not curious any more. You know what Hanna's widdler looks like, don't you?"

'He: "It'll grow, though, won't it?"²

'I: "Yes, of course. But when it's grown it won't look like yours."

'He: "I know that. It'll be the same" (sc. as it now is) "only bigger."

'I: "When we were at Gmunden, were you curious when your Mummy undressed?"

'He: "Yes. And then when Hanna was in her bath I saw her widdler."

'I: "And Mummy's too?"

'He: "No."

'I: "You were disgusted when you saw Mummy's drawers?"

¹ The flat they were in before the move.

² Hans wants to be assured that his own widdler will grow.

'He: "Only when I saw the black ones - when she bought them - then I spat. But I don't spit when she puts her drawers on or takes them off. *I spit because the black drawers are like a lumf and the yellow ones like a widdle, and then I think I've got to widdle.* When Mummy has her drawers on I don't see them; she's got her clothes on over them."

'I: "And when she takes off her clothes?"

'He: "I don't spit then either. But when her drawers are new they look like a lumf. When they're old, the colour goes away and they get dirty. When you buy them they're quite clean, but at home they've been made dirty. When they're bought they're new, and when they're not bought they're old."

'I: "Then you aren't disgusted by old ones?"

'He: "When they're old they're much blacker than a lumf, aren't they? They're just a bit blacker."¹

'I: "Have you often been into the W.C. with Mummy?"

'He: "Very often."

'I: "And were you disgusted?"

'He: "Yes. . . . No."

'I: "You like being there when Mummy widdles or does lumf?"

'He: "Yes, very much."

'I: "Why do you like it so much?"

'He: "I don't know."

'I: "Because you think you'll see her widdler."

'He: "Yes, I do think that."

'I: "But why won't you ever go into the W.C. at Lainz?"

'(At Lainz he always begs me not to take him into the W.C.; he was frightened once by the noise of the flush.)

¹ Our young man was here wrestling with a subject of which he was not equal to giving a clear exposition; so that there is some difficulty in understanding him. He may perhaps have meant that the drawers only recalled his feelings of disgust when he saw them on their own account; as soon as his mother had them on, he ceased to connect them with lumf or widdle, and they then interested him in a different way.

'He: "Perhaps it's because it makes a row when you pull the plug."

'I: "And then you're afraid."

'He: "Yes."

'I: "And what about our W.C. here?"

'He: "Here I'm not. At Lainz it gives me a fright when you pull the plug. And when I'm inside and the water rushes down, then it gives me a fright too."

'And, "just to show me that he wasn't frightened in our flat," he made me go into the W.C. and set the flush in motion. He then explained to me:

"First there's a loud row, and then a loose one." (This is when the water comes down.) "When there's a loud row I'd rather stay inside, and when there's a soft one I'd rather go out."

'I: "Because you're afraid?"

'He: "Because if there's a loud row I always so much like to see it" - (correcting himself) "to hear it; so I'd rather stay inside and hear it properly."

'I: "What does a loud row remind you of?"

'He: "That I've got to do lumf in the W.C." (The same thing, that is, that the black drawers reminded him of.)

'I: "Why?"

'He: "I don't know. A loud row sounds as though you were doing lumf. A big row reminds me of lumf, and a little one of widdle." (Cf. the black and the yellow drawers.)

'I: "I say, wasn't the bus-horse the same colour as a lumf" (According to his account it had been black.)

'He (very much struck): "Yes."

At this point I must put in a few words. Hans's father was asking too many questions, and was pressing the inquiry along his own lines instead of allowing the little boy to express his thoughts. For this reason the analysis began to be obscure and uncertain. Hans went his own way and would produce nothing if attempts were made to draw him off it. For the moment his interest was evidently centred upon lumf and widdle, but we cannot tell why. Just as little satisfactory light was thrown upon the business of the row as upon that of the yellow and black drawers. I suspect that the boy's sharp ears had clearly detected the difference between the sounds made by a man micturating and a woman. The analysis succeeded in forcing the material somewhat artificially into an expression of the distinction between the two different calls of nature. I can only advise those of my readers who have not as yet themselves conducted an analysis not to try to understand everything at once, but to give a kind of unbiased attention to every point that arises and to await further developments.

'April 11th. This morning Hans came into our room again and was sent away, as he always has been for the last few days.

'Later on, he began: "Daddy, I thought something: *I was in the bath,¹ and the plumber came and unscrewed it.² Then he took a bigger borer and stuck it into my stomach.*"

Hans's father translated this phantasy as follows: "'I was in bed with Mummy. Then Daddy came and drove me away. With his big penis he pushed me out of my place by Mummy.'"

Let us suspend our judgement for the present.

'He went on to relate a second idea that he had had: "We were travelling in the train to Gmunden. In the station we put on our clothes; but we couldn't get it done in time, and the train carried us on."

'Later on, I asked: "Have you ever seen a horse doing lumf?"

'Hans: "Yes, very often."

'I: "Does it make a loud row when it does lumf?"

'Hans: "Yes."

'I: "What does the row remind you of?"

'Hans: "Like when lumf falls into the chamber."

'The bus-horse that falls down and makes a row with its feet is no doubt - a lumf falling and making a noise. His fear of defaecation and his fear of heavily loaded carts is equivalent to the fear of a heavily loaded stomach.'

In this roundabout way Hans's father was beginning to get a glimmering of the true state of affairs.

¹ 'Hans's mother gives him his bath.'

² 'To take it away to be repaired.'

'April 11th. At luncheon Hans said: "If only we had a bath at Gmunden, so that I didn't have to go to the public baths!" It is a fact that at Gmunden he was always taken to the neighbouring public baths to be given a hot bath - a proceeding against which he used to protest with passionate tears. And in Vienna, too, he always screams if he is made to sit or lie in the big bath. He must be given his bath kneeling or standing.'

Hans was now beginning to bring fuel to the analysis in the shape of spontaneous utterances of his own. This remark of his established the connection between his two last phantasies - that of the plumber who unscrewed the bath and that of the unsuccessful journey to Gmunden. His father had correctly inferred from the latter that Hans had some aversion to Gmunden. This, by the way, is another good reminder of the fact that what emerges from the unconscious is to be understood in the light not of what goes before but of what comes after.

'I asked him whether he was afraid, and if so of what.

'Hans: "Because of falling in."

': "But why were you never afraid when you had your bath in the little bath?"

'Hans: "Why, I sat in that one. I couldn't lie down in it, it was too small."

': "When you went in a boat at Gmunden weren't you afraid of falling into the water?"

'Hans: "No, because I held on, so I couldn't fall in. It's only in the big bath that I'm afraid of falling in."

': "But Mummy baths you in it. Are you afraid of Mummy dropping you in the water?"

'Hans: "I'm afraid of her letting go and my head going in."

': "But you know Mummy's fond of you and won't let go of you."

'Hans: "I only just thought it."

': "Why?"

'Hans: "I don't know at all."

': "Perhaps it was because you'd been naughty and thought she didn't love you any more?"

'Hans: "Yes."

': "When you were watching Mummy giving Hanna her bath, perhaps you wished she would let go of her so that Hanna should fall in?"

'Hans: "Yes."

Hans's father, we cannot help thinking, had made a very good guess.

'April 12th. As we were coming back from Lainz in a second-class carriage, Hans looked at the black leather upholstery of the seats, and said: "Ugh! that makes me spit! Black drawers and black horses make me spit too, because I have to do lumf."

'I: "Perhaps you saw something of Mummy's that was black, and it frightened you?"

'Hans: "Yes."

'I: "Well, what was it?"

'Hans: "I don't know. A black blouse or black stockings."

'I: "Perhaps it was black hair near her widdler, when you were curious and looked."

'Hans (defending himself): "But I didn't see her widdler."

'Another time, he was frightened once more at a cart driving out of the yard gates opposite. "Don't the gates look like a behind?" I asked.

'He: "And the horses are the lumfs!" Since then, whenever he sees a cart driving out, he says: "Look, there's a 'lumfy' coming!" This form of the word ("lumfy") is quite a new one to him; it sounds like a term of endearment. My sister-in-law always calls her child "Wumfy".

'On April 13th he saw a piece of liver in the soup and exclaimed: "Ugh! A lumf!" Meat croquettes, too, he eats with evident reluctance, because their form and colour remind him of lumf.

'In the evening my wife told me that Hans had been out on the balcony and had said: "I thought to myself Hanna was on the balcony and fell down off it." I had once or twice told him to be careful that Hanna did not get too near the balustrade when she was out on the balcony; for the railing was designed in the most unpractical way (by a metal-worker of the Secessionist movement) and had big gaps in it which I had to have filled in with wire netting. Hans's repressed wish was very transparent. His mother asked him if he would rather Hanna were not there, to which he said "Yes".

'April 14th. The theme of Hanna is uppermost. As you may remember from earlier records, Hans felt a strong aversion to the new-born baby that robbed him of a part of his parents' love. This dislike has not entirely disappeared and is only partly overcompensated by an exaggerated affection.¹ He has already several times expressed a wish that the stork should bring no more babies and that we should pay him money not to bring any more "out of the big box" where babies are. (Compare his fear of furniture-vans. Does not a bus look like a big box?) Hanna screams such a lot, he says, and that's a nuisance to him.

¹ The 'Hanna' theme immediately succeeded the 'lumf' theme, and the explanation of this at length begins to dawn upon us: Hanna was a lumf herself - babies were lumfs.

'Once he suddenly said: "Can you remember when Hanna came? She lay beside Mummy in bed, so nice and good." (His praise rang suspiciously hollow.)

'And then as regards downstairs, outside the house. There is again great progress to be reported. Even drays cause him less alarm. Once he called out, almost with joy: "Here comes a horse with something black on its mouth!" And I was at last able to establish the fact that it was a horse with a leather muzzle. But Hans was not in the least afraid of this horse.

'Once he knocked on the pavement with his stick and said: "I say, is there a man underneath? - some one buried? - or is that only in the cemetery?" So he is occupied not only with the riddle of life but with the riddle of death.

'When we got indoors again I saw a box standing in the front hall, and Hans said: "Hanna travelled with us to Gmunden in a box like that. Whenever we travelled to Gmunden she travelled with us in the box. You don't believe me again? Really, Daddy. Do believe me. We got a big box and it was full of babies; they sat in the bath." (A small bath had been packed inside the box.) "I put them in it. Really and truly. I can remember quite well."¹

'I: "What can you remember?"

'Hans: "That Hanna travelled in the box; because I haven't forgotten about it. My word of honour!"

'I: "But last year Hanna travelled with us in the railway carriage."

'Hans: "*But before that she always travelled with us in the box.*"

¹ Hans was now going off into a phantasy. As we can see, a box and a bath have the same meaning for him: they both represent the space which contains the babies. We must bear in mind Hans's repeated assurances on this point.

'I: "Didn't Mummy have the box?"

'Hans: "Yes. Mummy had it."

'I: "Where?"

'Hans: "At home in the attic."

'I: "Perhaps she carried it about with her?"¹

'Hans: "No. And when we travel to Gmunden this time Hanna'll travel in the box again."

'I: "And how did she get out of the box, then?"

'Hans: "She was taken out."

'I: "By Mummy?"

'Hans: "Mummy and me. Then we got into the carriage, and Hanna rode on the horse, and the coachman said 'Gee-up'. The coachman sat up in front. Were you there too? Mummy knows all about it. Mummy doesn't know; she's forgotten about it already, but don't tell her anything!"

'I made him repeat the whole of this.

'Hans: "Then Hanna got out."

'I: "Why, she couldn't walk at all then."

'Hans: "Well then, we lifted her down."

'I: "But how could she have sat on the horse? She couldn't sit up at all last year."

'Hans: "Oh yes, she sat up all right, and called out 'Gee-up', and whipped with her whip - 'Gee-up! Gee-up!' - the whip I used to have. The horse hadn't any stirrups, but Hanna rode it. I'm not joking, you know, Daddy."

What can be the meaning of the boy's obstinate persistence in all this nonsense? Oh no, it was no nonsense: it was parody, it was Hans's revenge upon his father. It was as much as to say: '*If you really expect me to believe that the stork brought Hanna in October, when even in the summer, while we were travelling to Gmunden, I'd noticed how big Mother's stomach was, - then I expect you to believe my lies.*' What can be the meaning of the assertion that even the summer before the last Hanna had travelled with them to Gmunden 'in the box', except that he knew about his mother's pregnancy? His holding out the prospect of a repetition of this journey in the box in each successive year exemplifies a common way in which unconscious thoughts from the past emerge into consciousness; or it may have special reasons and express his dread of seeing a similar pregnancy repeated on their next summer holiday. We now see, moreover, what the circumstances were that had made him take a dislike to the journey to Gmunden, as his second phantasy had indicated.

¹ The box was of course the womb. (Hans's father was trying to let him know that he understood this.) And the same is true of the caskets in which so many of the heroes of mythology were exposed, from the time of King Sargon of Agade onwards. - [Added 1923:] Cf. Rank's study, *Der Mythos von der Geburt des Helden*, 1909.

'Later on, I asked him how Hanna had actually come into his mother's bed after she was born.'

This gave Hans a chance of letting himself go and fairly 'stuffing' his father.

'*Hans*: "Hanna just came. Frau Kraus" (the midwife) "put her in the bed. She couldn't walk, of course. But the stork carried her in his beak. Of course she couldn't walk." (He went on without a pause.) "The stork came up the stairs up to the landing, and then he knocked and everybody was asleep, and he had the right key and unlocked the door and put Hanna in *your*¹ bed, and Mummy was asleep - no, the stork put her in *her* bed. It was the middle of the night, and then the stork put her in the bed very quietly, he didn't trample about at all, and then he took his hat and went away again. No, he hadn't got a hat."

'I: "Who took his hat? The doctor, perhaps?"

'*Hans*: "Then the stork went away; he went home, and then he rang at the door, and every one in the house stopped sleeping. But don't tell this to Mummy or Tini" (the cook). "It's a secret."

'I: "Are you fond of Hanna?"

¹ Ironical, of course. Like his subsequent request that none of the secret should be betrayed to his mother.

'Hans: "Oh yes, very fond."
'I: "Would you rather that Hanna weren't alive or that she were?"
'Hans: "I'd rather she weren't alive."
'I: "Why?"
'Hans: "At any rate she wouldn't scream so, and I can't bear her screaming."
'I: "Why, you scream yourself."
'Hans: "But Hanna screams too."
'I: "Why can't you bear it?"
'Hans: "Because she screams so loud."
'I: "Why, she doesn't scream at all."
'Hans: "When she's whacked on her bare bottom, then she screams."
'I: "Have you ever whacked her?"
'Hans: "When Mummy whacks her on her bottom, then she screams."
'I: "And you don't like that?"
'Hans: "No. . . . Why? Because she makes such a row with her screaming."
'I: "If you'd rather she weren't alive, you can't be fond of her at all."
'Hans (assenting): "H'm, well."
'I: "That was why you thought when Mummy was giving her her bath, if only she'd let go, Hanna would fall into the water . . ."
'Hans (taking me up): ". . . and die."
'I: "And then you'd be alone with Mummy. A good boy doesn't wish that sort of thing, though."
'Hans: "*But he may THINK it.*"
'I: "But that isn't good."
'Hans: "*If he thinks it, it IS good all the same, because you can write it to the Professor.*"¹

¹ Well done, little Hans! I could wish for no better understanding of psycho-analysis from any grown-up.

'Later on I said to him: "You know, when Hanna gets bigger and can talk, you'll be fonder of her."

'Hans: "Oh no. I *am* fond of her. In the autumn, when she's big, I shall go with her to the Stadtpark quite alone, and explain everything to her."

'As I was beginning to give him some further enlightenment, he interrupted me, probably with the intention of explaining to me that it was not so wicked of him to wish that Hanna was dead.

'Hans: "You know, all the same, she'd been alive a long time even before she was here. When she was with the stork she was alive too."

'I: "No. Perhaps she wasn't with the stork after all."

'Hans: "Who brought her, then? The stork had got her."

'I: "Where did he bring her from, then?"

'Hans: "Oh - from him."

'I: "Where had he got her, then?"

'Hans: "In the box; in the *stork-box*."

'I: "Well, and what does the box look like?"

'Hans: "Red. Painted red." (Blood?)

'I: "Who told you that?"

'Hans: "Mummy . . . I thought it to myself . . . it's in the book."

'I: "In what book?"

'Hans: "In the picture-book." (I made him fetch his first picture-book. In it was a picture of a stork's nest with storks, on a red chimney. This was the box. Curiously enough, on the same page there was also a picture of a horse being shod. Hans had transferred the babies into the box, as they were not to be seen in the nest.)

'I: "And what did the stork do with her?"

'Hans: "Then the stork brought Hanna here. In his beak. You know, the stork that's at Schönbrunn, and that bit the umbrella." (A reminiscence of an episode at Schönbrunn.)

'I: "Did you see how the stork brought Hanna?"

'Hans: "Why, I was still asleep, you know. A stork can never bring a little girl or a little boy in the morning."

'I: "Why?"

'Hans: "He can't. A stork can't do it. Do you know why: So that people shan't see. And then, all at once, in the morning, there's a little girl there."¹

'I: "But, all the same, you were curious at the time to know how the stork did it?"

'Hans: "Oh yes."

'I: "What did Hanna look like when she came?"

'Hans (hypocritically): "All white and lovely. So pretty"

'I: "But when you saw her the first time you didn't like her."

'Hans: "Oh, I did; very much!"

'I: "You were surprised that she was so small, though."

'Hans: "Yes."

'I: "How small was she?"

'Hans: "Like a baby stork."

'I: "Like what else? Like a lumf, perhaps?"

'Hans: "Oh no. A lumf's much bigger . . . a bit smaller than Hanna, really."

I had predicted to his father that it would be possible to trace back Hans's phobia to thoughts and wishes occasioned by the birth of his baby sister. But I had omitted to point out that according to the sexual theory of children a baby is a 'lumf', so that Hans's path would lie through the excremental complex. It was owing to this neglect on my part that the progress of the case became temporarily obscured. Now that the matter had been cleared up, Hans's father attempted to examine the boy a second time upon this important point.

¹ There is no need to find fault with Hans's inconsistencies. In the previous conversation his disbelief in the stork had emerged from his unconscious and had been coupled with the exasperation he felt against his father for making so many mysteries. But he had now become calmer and was answering his father's questions with official thoughts in which he had worked out glosses upon the many difficulties involved in the stork hypothesis.

The next day, 'I got Hans to repeat what he had told me yesterday. He said: "Hanna travelled to Gmunden in the big box, and Mummy travelled in the railway carriage, and Hanna travelled in the luggage train with the box; and then when we got to Gmunden Mummy and I lifted Hanna out and put her on the horse. The coachman sat up in front, and Hanna had the old whip" (the whip he had last year) "and whipped the horse and kept on saying 'Gee-up', and it was such fun, and the coachman whipped too. -The coachman didn't whip at all, because Hanna had the whip. -The coachman had the reins - Hanna had the reins too." (On each occasion we drove in a carriage from the station to the house. Hans was here trying to reconcile fact and fancy.) "At Gmunden we lifted Hanna down from the horse, and she walked up the steps by herself." (Last year, when Hanna was at Gmunden, she was eight months old. The year before that - and Hans's phantasy evidently related to that time his mother had been five months gone with child when we arrived at Gmunden.)

'I: "Last year Hanna was there."

'Hans: "Last year she drove in the carriage; but the year before that, when she was living with us . . ."

'I: "Was she with us already then?"

'Hans: "Yes. You were always there; you used always to go in the boat with me, and Anna was our servant."

'I: "But that wasn't last year. Hanna wasn't alive then."

'Hans: "Yes, *she was alive then*. Even while she was still travelling in the box she could run about and she could say 'Anna'." (She has only been able to do so for the last four months.)

'I: "But she wasn't with us at all then."

'Hans: "Oh yes, she was; she was with the stork."

'I: "How old is she, then?"

'Hans: "She'll be two years old in the autumn. Hanna was there, you know she was."

'I: "And when was she with the stork in the stork-box?"

'Hans: "A long time before she travelled in the box, a very long time."

'I: "How long has Hanna been able to walk, then? When she was at Gmunden she couldn't walk yet."

'Hans: "Not last year; but other times she could."

'I: "But Hanna's only been at Gmunden once."

'Hans: "No. She's been twice. Yes, that's it. I can remember quite well. Ask Mummy, she'll tell you soon enough."

'I: "It's not true, all the same."

'Hans: "Yes, it is true. *When she was at Gmunden the first time she could walk and ride, and later on she had to be carried.* -No. It was only later on that she rode, and last year she had to be carried."

'I: "But it's only quite a short time that she's been walking. At Gmunden she couldn't walk."

'Hans: "Yes. Just you write it down. I can remember quite well. -Why are you laughing?"

'I: "Because you're a fraud; because you know quite well that Hanna's only been at Gmunden once."

'Hans: "No, that isn't true. The first time she rode on the horse . . . and the second time . . ." (He showed signs of evident uncertainty.)

'I: "Perhaps the horse was Mummy?"

'Hans: "No, a real horse in a fly."

'I: "But we used always to have a carriage with two horses."

'Hans: "Well, then, it was a carriage and pair."

'I: "What did Hanna eat inside the box?"

'Hans: "They put in bread-and-butter for her, and herring, and radishes" (the sort of thing we used to have for supper at Gmunden), "and as Hanna went along she buttered her bread-and-butter and ate fifty meals."

'I: "Didn't Hanna scream?"

'Hans: "No."

'I: "What did she do, then?"

'Hans: "Sat quite still inside."

'I: "Didn't she push about?"

'Hans: "No, she kept on eating all the time and didn't stir once. She drank up two big mugs of coffee - by the morning it was all gone, and she left the bits behind in the box, the leaves of the two radishes and a knife for cutting the radishes. She gobbled everything up like a hare: one minute and it was all finished. It was a joke. Hanna and I really travelled together in the box; I slept the whole night in the box." (We did in fact, two years ago, make the journey to Gmunden by night.) "And Mummy travelled in the railway carriage. And we kept on eating all the time when we were driving in the carriage, too; it was jolly. - She didn't ride on a horse at all . . ." (he now became undecided, for he knew that we had driven with two horses) " . . . she sat in the carriage. Yes, that's how it was, but Hanna and I drove quite by ourselves . . . Mummy rode on the horse, and Karoline" (our maid last year) "on the other . . . I say, what I'm telling you isn't a bit true."

'I: "What isn't true?"

'Hans: "None of it is. I say, let's put Hanna and me in the box¹ and I'll widdle into the box. I'll just widdle into my knickers; I don't care a bit; there's nothing at all shameful in it. I say, that isn't a joke, you know; but it's great fun, though."

¹ 'The box standing in the front hall which we had taken to Gmunden as luggage.'

'Then he told me the story of how the stork came - the same story as yesterday, except that he left out the part about the stork taking his hat when he went away.

'I: "Where did the stork keep his latch-key?"

'Hans: "In his pocket."

'I: "And where's the stork's pocket?"

'Hans: "In his beak."

'I: "It's in his beak! I've never seen a stork yet with a key in his beak."

'Hans: "How else could he have got in? How did the stork come in at the door, then? No, it isn't true; I just made a mistake. The stork rang at the front door and some one let him in."

'I: "And how did he ring?"

'Hans: "He rang the bell."

'I: "How did he do that?"

'Hans: "He took his beak and pressed on it with his beak."

'I: "And did he shut the door again?"

'Hans: "No, a maid shut it. She was up already, you see, and opened the door for him and shut it."

'I: "Where does the stork live!"

'Hans: "Where? In the box where he keeps the little girls. At Schönbrunn, perhaps."

'I: "I've never seen a box at Schönbrunn."

'Hans: "It must be farther off, then. -Do you know how the stork opens the box? He takes his beak - the box has got a key, too - he takes his beak, lifts up one' ' (i.e. one-half of the beak) "and unlocks it like this." (He demonstrated the process on the lock of the writing-table.) "There's a handle on it too."

'I: "Isn't a little girl like that too heavy for him?"

'Hans: "Oh no."

'I: "I say, doesn't a bus look like a stork-box?"

'Hans: "Yes,"

'I: "And a furniture-waggon?"

'Hans: "And a scallywaggon" ("scallywag" - a term of abuse for naughty children) "too."

'April 17th. Yesterday Hans carried out his long-premeditated scheme of going across into the courtyard opposite. He would not do it to-day, as there was a cart standing at the loading dock exactly opposite the entrance gates. "When a cart stands there," he said to me, "I'm afraid I shall tease the horses and they'll fall down and make a row with their feet."

'I: "How does one tease horses!"

'Hans: "When you're cross with them you tease them, and when you shout 'Gee-up'."¹

'I: "Have you ever teased horses?"

'Hans: "Yes, quite often. I'm *afraid* I shall do it, but I don't *really*."

'I: "Did you ever tease horses at Gmunden?"

'Hans: "No."

'I: "But you like teasing them?"

'Hans: "Oh yes, very much."

'I: "Would you like to whip them?"

'Hans: "Yes."

'I: "Would you like to beat the horses as Mummy beats Hanna? You like that too, you know."

'Hans: "It doesn't do the horses any harm when they're beaten." (I said this to him once to mitigate his fear of seeing horses whipped.) "Once I really did it. Once I had the whip, and whipped the horse, and it fell down and made a row with its feet."

'I: "When?"

'Hans: "At Gmunden."

'I: "A real horse? Harnessed to a cart?"

'Hans: "It wasn't in the cart."

¹ 'Hans has often been very much terrified when drivers beat their horses and shout "Gee-up".'

'I: "Where was it, then?"
 'Hans: "I just held it so that it shouldn't run away." (Of course, all this sounded most improbable.)
 'I: "Where was that?"
 'Hans: "Near the trough."
 'I: "Who let you? Had the coachman left the horse standing there?"
 'Hans: "It was just a horse from the stables."
 'I: "How did it get to the trough?"
 'Hans: "I took it there."
 'I: "Where from? Out of the stables?"
 'Hans: "I took it out because I wanted to beat it."
 'I: "Was there no one in the stables?"
 'Hans: "Oh yes, Loisl." (The coachman at Gmunden.)
 'I: "Did he let you?"
 'Hans: "I talked nicely to him, and he said I might do it."
 'I: "What did you say to him?"
 'Hans: "Could I take the horse and whip it and shout at it. And he said 'Yes'."
 'I: "Did you whip it a lot?"
 'Hans: "*What I've told you isn't the least true.*"
 'I: "How much of it's true?"
 'Hans: "None of it's true; I only told it you for fun."
 'I: "You never took a horse out of the stables?"
 'Hans: "Oh no."
 'I: "But you wanted to."
 'Hans: "Oh yes, wanted to. I've thought it to myself."
 'I: "At Gmunden?"
 'Hans: "No, only here. I thought it in the morning when I was quite undressed; no, in the morning in bed."
 'I: "Why did you never tell me about it?"
 'Hans: "I didn't think of it."
 'I: "You thought it to yourself because you saw it in the street."
 'Hans: "Yes."
 'I: "Which would you really like to beat? Mummy, Hanna, or me?"
 'Hans: "Mummy."
 'I: "Why?"
 'Hans: "I should just like to beat her."
 'I: "When did you ever see any one beating their Mummy?"
 'Hans: "I've never seen any one do it, never in all my life."
 'I: "And yet you'd just like to do it. How would you like to set about it?"
 'Hans: "With a carpet-beater." (His mother often threatens to beat him with the carpet-beater.)
 'I was obliged to break off the conversation for to-day.
 'In the street Hans explained to me that buses, furniture vans, and coal-carts were stork-box carts.'
 That is to say, pregnant women. Hans's access of sadism immediately before cannot be unconnected with the present theme.

'April 21st. This morning Hans said that he had thought as follows: "There was a train at Lainz and I travelled with my Lainz Grandmummy to the Hauptzollamt station. You hadn't got down from the bridge yet, and the second train was already at St. Veit. When you came down, the train was there already, and we got in."

'(Hans was at Lainz yesterday. In order to get on to the departure platform one has to cross a bridge. From the platform one can see along the line as far as St. Veit station. The whole thing is a trifle obscure. Hans's original thought had no doubt been that he had gone off by the first train, which I had missed, and that then a second train had come in from Unter St. Veit and that I had gone after him in it. But he had distorted a part of this runaway phantasy, so that he said finally: "Both of us only got away by the second train."

'This phantasy is related to the last one, which was not interpreted, and according to which we took too long to put on our clothes in the station at Gmunden, so that the train carried us on.)

'Afternoon, in front of the house. Hans suddenly ran indoors as a carriage with two horses came along. I could see nothing unusual about it, and asked him what was wrong. "The horses are so proud," he said, "that I'm afraid they'll fall down." (The coachman was reining the horses in tight, so that they were trotting with short steps and holding their heads high. In fact their action was "proud".)

'I asked him who it really was that was so proud.

'He: "You are, when I come into bed with Mummy."

'I: "So you want me to fall down?"

'Hans: "Yes. You've got to be naked" (meaning "bare foot", as Fritzl had been) "and knock up against a stone and bleed, and then I'll be able to be alone with Mummy for a little bit at all events. When you come up into our flat I'll be able to run away quick so that you don't see."

'I: "Can you remember who it was that knocked up against the stone?"

'He: "Yes, Fritzl."

'I: "When Fritzl fell down, what did you think?"¹

'He: "That *you* should hit the stone and tumble down."

'I: "So you'd like to go to Mummy?"

'He: "Yes."

'I: "What do I really scold you for?"

'He: "I don't know." (!!)

'I: "Why?"

'He: "Because you're cross."

'I: "But that's not true."

'Hans: "Yes, it *is* true. You're cross. I know you are. It must be true."

¹ So that in fact Fritzl *did* fall down - which he at one time denied.

'Evidently, therefore, my explanation that only *little* boys come into bed with their Mummies and that *big* ones sleep in their own beds had not impressed him very much.

'I suspect that his desire to "tease" the horse, i.e. to beat it and shout at it, does not apply to his mother, as he pretended, but to me. No doubt he only put her forward because he was unwilling to admit the alternative to me. For the last few days he has been particularly affectionate to me.'

Speaking with the air of superiority which is so easily acquired after the event, we may correct Hans's father, and explain that the boy's wish to 'tease' the horse had two constituents; it was compounded of an obscure sadistic desire for his mother and of a clear impulse for revenge against his father. The latter could not be reproduced until the former's turn had come to emerge in connection with the pregnancy complex. In the process of the formation of a phobia from the unconscious thoughts underlying it, condensation takes place; and for that reason the course of the analysis can never follow that of the development of the neurosis.

'April 22nd. This morning Hans again thought something to himself: "A street-boy was riding on a truck, and the guard came and undressed the boy quite naked and made him stand there till next morning, and in the morning the boy gave the guard 50,000 florins so that he could go on riding on the truck."

'(The Nordbahn runs past opposite our house. In a siding there stood a trolley on which Hans once saw a street-boy riding. He wanted to do so too; but I told him it was not allowed, and that if he did the guard would be after him. A second element in this phantasy is Hans's repressed wish to be naked.)'

It has been noticeable for some time that Hans's imagination was being coloured by images derived from traffic, and was advancing systematically from horses, which draw vehicles, to railways. In the same way a railway-phobia eventually becomes associated with every street-phobia.

'At lunch-time I was told that Hans had been playing all the morning with an india-rubber doll which he called Grete. He had pushed a small penknife in through the opening to which the little tin squeaker had originally been attached, and had then torn the doll's legs apart so as to let the knife drop out. He had said to the nurse-maid, pointing between the doll's legs: "Look, there's its widdler!"

'I: "What was it you were playing at with your doll to-day?"

'Hans: "I tore its legs apart. Do you know why? Because there was a knife inside it belonging to Mummy. I put it in at the place where the button squeaks, and then I tore apart its legs and it came out there."

'I: "Why did you tear its legs apart? So that you could see its widdler?"

'He: "Its widdler was there before; I could have seen it anyhow."

'I: "What did you put the knife in for?"

'He: "I don't know."

'I: "Well, what does the knife look like?"

'He brought it to me.

'I: "Did you think it was a baby, perhaps?"

'He: "No, I didn't think anything at all; but I believe the stork got a baby once - or some one."

'I: "When?"

'He: "Once. I heard so - or didn't I hear it at all? - or did I say it wrong?"

'I: "What does 'say it wrong' mean?"

'He: "That it's not true."

'I: "Everything one says is a bit true."

'He: "Well, yes, a little bit."

'I (after changing the subject): "How do you think chickens are born?"

'He: "The stork just makes them grow; the stork makes chickens grow - no, God does."

'I explained to him that chickens lay eggs, and that out of the eggs there come other chickens.

'Hans laughed.

'I: "Why do you laugh?"

'He: "Because I like what you've told me."

'He said he had seen it happen already.

'I: "Where?"

'Hans: "You did it."

'I: "Where did I lay an egg?"

'Hans: "At Gmunden; you laid an egg in the grass, and all at once a chicken came hopping out. You laid an egg once; I know you did, I know it for certain. Because Mummy said so."

'I: "I'll ask Mummy if that's true."

'Hans: "It isn't true a bit. But I once laid an egg, and a chicken came hopping out."

'I: "Where?"

'Hans: "At Gmunden I lay down in the grass - no, I knelt down - and the children didn't look on at me, and all at once in the morning I said: 'Look for it, children; I laid an egg yesterday.' And all at once they looked, and all at once they saw an egg, and out of it there came a little Hans. Well, what are you laughing for? Mummy didn't know about it, and Karoline didn't know, because no one was looking on, and all at once I laid an egg, and all at once it was there. Really and truly. Daddy, when does a chicken grow out of an egg? When it's left alone? Must it be eaten?"

'I explained the matter to him.

'Hans: "All right, let's leave it with the hen; then a chicken'll grow. Let's pack it up in the box and let's take it to Gmunden.'"

As his parents still hesitated to give him the information which was already long overdue, little Hans had by a bold stroke taken the conduct of the analysis into his own hands. By means of a brilliant symptomatic act, '*Look!*' he had said to them, '*this is how I imagine that a birth takes place.*' What he had told the maid-servant about the meaning of his game with the doll had been insincere; to his father he explicitly denied that he had only wanted to see its widdler. After his father had told him, as a kind of payment on account, how chickens come out of eggs, Hans gave a combined expression to his dissatisfaction, his mistrust, and his superior knowledge in a charming piece of persiflage, which culminated with his last words in an unmistakable allusion to his sister's birth.

'I: "What were you playing at with your doll?"

'Hans: "I said 'Grete' to her."

'I: "Why?"

'Hans: "Because I said 'Grete' to her."

'I: "How did you play?"

'Hans: "'I just looked after her like a real baby."

'I: "Would you like to have a little girl?"

'Hans: "Oh yes. Why not? I should like to have one, but Mummy mustn't have one; I don't like that."

(He has often expressed this view before. He is afraid of losing still more of his position if a third child arrives.)

'I: "But only women have children."

'Hans: "I'm going to have a little girl."

'I: "Where will you get her, then?"

'Hans: "Why, from the stork. *He takes the little girl out*, and all at once the little girl lays an egg, and out of the egg there comes another Hanna - another Hanna. Out of Hanna there comes another Hanna. No, *one* Hanna comes out."

'I: "You'd like to have a little girl."

'Hans: "Yes, *next year I'm going to have one*, and she'll be called Hanna too."

'I: "But why isn't Mummy to have a little girl?"

'Hans: "Because *I want to have a little girl for once*."

'I: "But you can't have a little girl."

'Hans: "Oh yes, boys have girls and girls have boys."¹

'I: "Boys don't have children. Only women, only Mummies have children."

'Hans: "But why shouldn't I?"

'I: "Because God's arranged it like that."

'Hans: "But why don't *you* have one? Oh yes, you'll have one all right. Just you wait."

'I: "I shall have to wait some time."

'Hans: "But I belong to you."

'I: "But Mummy brought you into the world. So you belong to Mummy and me."

'Hans: "Does Hanna belong to me or to Mummy?"

'I: "To Mummy."

'Hans: "No, to me. *Why not to me and Mummy?*"

'I: "Hanna belongs to me, Mummy, and you."

'Hans: "There you are, you see."

So long as the child is in ignorance of the female genitals, there is naturally a vital gap in his comprehension of sexual matters.

'On April 24th my wife and I enlightened Hans up to a certain point: we told him that children grow inside their Mummy, and are then brought into the world by being pressed out of her like a "lump", and that this involves a great deal of pain.

'In the afternoon we went out in front of the house. There was a visible improvement in his state. He ran after carts, and the only thing that betrayed a remaining trace of his anxiety was the fact that he did not venture away from the neighbourhood of the street-door and could not be induced to go for any considerable walk.

¹ Here is another bit of infantile sexual theory with an unsuspected meaning.

'On April 25th Hans butted me in the stomach with his head, as he has already done once before. I asked him if he was a goat.

"Yes," he said, "a ram." I enquired where he had seen a ram.

'He: "At Gmunden: Fritzl had one." (Fritzl had a real lamb to play with.)

'I: "You must tell me about the lamb. What did it do?"

'Hans: "You know, Fräulein Mizzi" (a school-mistress who lived in the house) "used always to put Hanna on the lamb, but it couldn't stand up then and it couldn't butt. If you went up to it it used to butt, because it had horns. Fritzl used to lead it on a string and tie it to a tree. He always tied it to a tree."

'I: "Did the lamb butt you?"

'Hans: "It jumped up at me; Fritzl took me up to it once. . . . I went up to it once and didn't know, and all at once it jumped up at me. It was such fun - I wasn't frightened."

'This was certainly untrue.

'I: "Are you fond of Daddy?"

'Hans: "Oh yes."

'I: "Or perhaps not."

'Hans was playing with a little toy horse. At that moment the horse fell down, and Hans shouted out: "The horse has fallen down! Look what a row it's making!"

'I: "You're a little vexed with Daddy because Mummy's fond of him."

'Hans: "No."

'I: "Then why do you always cry whenever Mummy gives me a kiss? It's because you're jealous."

'Hans: "Jealous, yes."

'I: "You'd like to be Daddy yourself."

'Hans: "Oh yes."

'I: "What would you like to do if you were Daddy?"

'Hans: "And you were Hans? I'd like to take you to Lainz every Sunday - no, every week-day too. If I were Daddy I'd be ever so nice and good."

'I: "But what would you like to do with Mummy?"

'Hans: "Take her to Lainz, too."

'I: "And what besides?"

'Hans: "Nothing."

'I: "Then why were you jealous?"

'Hans: "I don't know."

'I: "Were you jealous at Gmunden, too?"

'Hans: "Not at Gmunden." (This is not true.) "At Gmunden I had my own things. I had a garden at Gmunden and children too."

'I: "Can you remember how the cow got a calf?"

'Hans: "Oh yes. It came in a cart." (No doubt he had been told this at Gmunden; another attack on the stork theory.) "And another cow pressed it out of its behind." (This was already the fruit of his enlightenment, which he was trying to bring into harmony with the cart theory.)

'I: "It isn't true that it came in a cart; it came out of the cow in the cow-shed."

'Hans disputed this, saying that he had seen the cart in the morning. I pointed out to him that he had probably been told this about the calf having come in a cart. In the end he admitted this, and said: "Most likely Berta told me, or not - or perhaps it was the landlord. He was there and it was at night, so it *is* true after all, what I've been telling you - or it seems to me nobody told me; I thought it to myself in the night."

'Unless I am mistaken, the calf was taken away in a cart; hence the confusion.

': "Why didn't you think it was the stork that brought it?"

'Hans: "I didn't want to think that."

': "But you thought the stork brought Hanna?"

'Hans: "In the morning" (of the confinement) "I thought so. - I say, Daddy, was Herr Reisenbichler" (our landlord) "there when the calf came out of the cow?"¹

': "I don't know. Do you think he was?"

'Hans: "I think so. . . . Daddy, have you noticed now and then that horses have something black on their mouths?"

': "I've noticed it now and then in the street at Gmunden."

': "Did you often get into bed with Mummy at Gmunden?"

'Hans: "Yes."

': "And you used to think to yourself you were Daddy?"

'Hans: "Yes."

': "And then you felt afraid of Daddy?"

'Hans: "*You know everything. I didn't know anything.*"

': "When Fritzl fell down you thought: 'If only Daddy would fall down like that! ' And when the lamb butted you you thought: 'If only it would butt Daddy!' Can you remember the funeral at Gmunden?" (The first funeral that Hans had seen. He often recalls it, and it is no doubt a screen memory.)

'Hans: "Yes. What about it?"

': "You thought then that if only Daddy were to die you'd be Daddy."

'Hans: "Yes."

': "What carts are you still afraid of?"

¹ Hans, having good reason to mistrust information given him by grown-up people, was considering whether the landlord might not be more trustworthy than his father.

² The train of thought is as follows. For a long time his father had refused to believe what he said about there being something black on horses' mouths, but finally it had been verified.

'Hans: "All of them."

'I: "You know that's not true."

'Hans: "I'm not afraid of carriages and pair or cabs with one horse. I'm afraid of buses and luggage-carts, but only when they're loaded up, not when they're empty. When there's one horse and the cart's loaded full up, then I'm afraid; but when there are two horses and it's loaded full up, then I'm not afraid."

'I: "Are you afraid of buses because there are so many people inside?"

'Hans: "Because there's so much luggage on the top."

'I: "When Mummy was having Hanna, was she loaded full up too?"

'Hans: "Mummy'll be loaded full up again when she has another one, when another one begins to grow, when another one's inside her."

'I: "And you'd like that?"

'Hans: "Yes."

'I: "You said you didn't want Mummy to have another baby."

'Hans: "Well, then she won't be loaded up again. Mummy said if Mummy didn't want one, God didn't want one either. If Mummy doesn't want one she won't have one." (Hans naturally asked yesterday if there were any more babies inside Mummy. I told him not, and said that if God did not wish it none would grow inside her.)

'Hans: "But Mummy told me if *she* didn't want it no more'd grow, and you say if *God* doesn't want it."

'So I told him it was as I had said, upon which he observed: "You were there, though, weren't you? You know better, for certain." He then proceeded to cross-question his mother, and she reconciled the two statements by declaring that if she didn't want it God didn't want it either.¹

¹ *Ce que femme veut Dieu veut*. But Hans, with his usual acumen, had once more put his finger upon a most serious problem.

'I: "It seems to me that, all the same, you do wish Mummy would have a baby."

'Hans: "But I don't want it to happen."

'I: "But you wish for it?"

'Hans: "Oh yes, *wish*."

'I: "Do you know why you wish for it? It's because you'd like to be Daddy."

'Hans: "Yes. . . . How does it work?"

'I: "How does what work?"

'Hans: "You say Daddies don't have babies; so how does it work, my wanting to be Daddy?"

'I: "You'd like to be Daddy and married to Mummy; you'd like to be as big as me and have a moustache; and you'd like Mummy to have a baby."

'Hans: "And, Daddy, when I'm married I'll only have one if I want to, when I'm married to Mummy, and if I don't want a baby, God won't want it either, when I'm married."

'I: "Would you like to be married to Mummy?"

'Hans: "Oh yes."

It is easy to see that Hans's enjoyment of his phantasy was interfered with by his uncertainty as to the part played by fathers and by his doubts as to whether the begetting of children would be under his control.

'On the evening of the same day, as Hans was being put to bed, he said to me: "I say, d'you know what I'm going to do now? Now I'm going to talk to Grete till ten o'clock; she's in bed with me. My children are always in bed with me. Can you tell me why that is?" -As he was very sleepy already, I promised him that we should write it down next day, and he went to sleep.

'I have already noticed in earlier records that since Hans's return from Gmunden he has constantly been having phantasies about "his children", has carried on conversations with them, and so on.¹

'So on April 26th I asked him why he was always thinking of his children.

'Hans: "Why? Because I should so like to have children; but I don't ever want it; I shouldn't like to have them."²

'I: "Have you always imagined that Berta and Olga and the rest were your children?"

'Hans: "Yes. Franzl, and Fritzl, and Paul too" (his playmates at Lainz), "and Lodi." This is an invented girl's name, that of his favourite child, whom he speaks of most often - I may here emphasize the fact that the figure of Lodi is not an invention of the last few days, but existed before the date of his receiving the latest piece of enlightenment (April 24th).

'I: "Who is Lodi? Is she at Gmunden?"

'Hans: "No."

'I: "Is there a Lodi?"

'Hans: "Yes, I know her."

'I: "Who is she, then?"

'Hans: "The one I've got here."

'I: "What does she look like?"

'Hans: "Look like? Black eyes, black hair. . . . I met her once with Mariedl" (at Gmunden) "as I was going into the town."

¹ There is no necessity on this account to assume in Hans the presence of a feminine strain of desire for having children. It was with his mother that Hans had had his most blissful experience as a child, and he was now repeating them, and himself playing the active part, which was thus necessarily that of mother.

² This startling contradiction was one between phantasy and reality, between wishing and having. Hans knew that in reality he was a child and that the other children would only be in his way; but in phantasy he was a mother and wanted children with whom he could repeat the endearments that he had himself experienced.

'When I went into the matter it turned out that this was an invention.'¹

'I: "So you thought you were their Mummy?"

'Hans: "And really I was their Mummy."

'I: "What did you do with your children?"

'Hans: "I had them to sleep with me, the girls and the boys."

'I: "Every day?"

'Hans: "Why, of course."

'I: "Did you talk to them?"

'Hans: "When I couldn't get all the children into the bed, I put some of the children on the sofa, and some in the pram, and if there were still some left over I took them up to the attic and put them in the box, and if there were any more I put them in the other box."

'I: "So the stork-baby-boxes were in the attic?"

'Hans: "Yes."

'I: "When did you get your children? Was Hanna alive already?"

'Hans: "Yes, she had been a long time."

'I: "But who did you think you'd got the children from?"

'Hans: "*Why from me.*"²

'I: "But at that time you hadn't any idea that children came from some one."

'Hans: "I thought the stork had brought them." (Clearly a lie and an evasion.)³

¹ It is possible, however, that Hans had exalted into his ideal some one whom he had met casually at Gmunden. The colour of this ideal's eyes and hair, by the way, was copied from his mother.

² Hans could not help answering from the auto-erotic point of view.

³ They were the children of his phantasy, that is to say, of his masturbation.

'I: "You had Grete in bed with you yesterday, but you know quite well that boys can't have children."
 'Hans: "Well, yes. But I believe they can, all the same."
 'I: "How did you hit upon the name Lodi? No girl's called that. Lotti, perhaps?"
 'Hans: "Oh no, Lodi. I don't know; but it's a beautiful name, all the same."
 'I (jokingly): "Perhaps you mean a Schokolodi?"¹
 'Hans (promptly): "No, a Saffalodi,² . . . because I like eating sausages so much, and salami too."
 'I: "I say, doesn't a Saffalodi look like a lumf"
 'Hans: "Yes."
 'I: "Well, what does a lumf look like?"
 'Hans: "Black. You know" (pointing at my eyebrows and moustache), "like this and like this."
 'I: "And what else? Round like a Saffaladi?"
 'Hans: "Yes."
 'I: "When you sat on the chamber and a lumf came, did you think to yourself you were having a baby?"
 'Hans (laughing): "Yes. Even at --- Street, and here as well."
 'I: "You know when the bus-horses fell down? The bus looked like a baby-box, and when the black horse fell down it was just like . . ."
 'Hans (taking me up): ". . . like having a baby."
 'I: "And what did you think when it made a row with its feet?"
 'Hans: "Oh, when I don't want to sit on the chamber and would rather play, then I make a row like this with my feet." (He stamped his feet.)
 'This was why he was so much interested in the question whether people *liked* or *did not like* having children.

¹ [*Schokolade* is the German for 'chocolate'.]

² "Saffaladi" means "*Zervelatwurst*" ["saveloy", a kind of sausage]. My wife is fond of relating how her aunt always calls it "Soffilodi". Hans may have heard this.'

'All day long to-day Hans has been playing at loading and unloading packing-cases; he said he wished he could have a toy waggon and boxes of that kind to play with. What used most to interest him in the courtyard of the Customs House opposite was the loading and unloading of the carts. And he used to be frightened most when a cart had been loaded up and was on the point of driving off. "The horses'll fall down,"¹ he used to say. He used to call the doors of the Head Customs House shed "holes" (e.g. the first hole, second hole, third hole, etc.). But now, instead of "hole", he says "behind-hole".

'The anxiety has almost completely disappeared, except that he likes to remain in the neighbourhood of the house, so as to have a line of retreat in case he is frightened. But he never takes flight into the house now, but stops in the street all the time. As we know, his illness began with his turning back in tears while he was out for a walk; and when he was obliged to go for a second walk he only went as far as the Hauptzollamt station on the Stadtbahn, from which our house can still be seen. At the time of my wife's confinement he was of course kept away from her; and his present anxiety, which prevents him from leaving the neighbourhood of the house, is in reality the longing for her which he felt then.

'April 30th. Seeing Hans playing with his imaginary children again, "Hullo," I said to him, "are your children still alive? You know quite well a boy can't have any children."

'Hans: "I know. I was their Mummy before, *now I'm their Daddy.*"

'I: "And who's the children's Mummy?"

'Hans: "Why, Mummy, and you're their *Grandaddy.*"

'I: "So then you'd like to be as big as me, and be married to Mummy, and then you'd like her to have children."

'Hans: "Yes, that's what I'd like, and then my Lainz Grandmummy" (my mother) "will be their Grannie."

Things were moving towards a satisfactory conclusion. The little Oedipus had found a happier solution than that prescribed by destiny. Instead of putting his father out of the way, he had granted him the same happiness that he desired himself: he made him a grandfather and married *him* to his own mother too.

¹ Do we not use the word '*niederkommen*' [literally, 'to come down'] when a woman is delivered?

'On May 1st Hans came to me at lunch-time and said: "D'you know what? Let's write something down for the Professor."

'I: "Well, and what shall it be?"

'*Hans*: "This morning I was in the W.C. with all my children. First I did lumf and widdled, and they looked on. Then I put them on the seat and they widdled and did lumf, and I wiped their behinds with paper. D'you know why? Because I'd so much like to have children; then I'd do everything for them - take them to the W.C., clean their behinds, and do everything one does with children."

After the admission afforded by this phantasy, it will scarcely be possible to dispute the fact that in Hans's mind there was pleasure attached to the excretory functions.

'In the afternoon he ventured into the Stadtpark for the first time. As it is the First of May, no doubt there was less traffic than usual, but still quite enough to have frightened him up to now. He was very proud of his achievement, and after tea I was obliged to go with him to the Stadtpark once again. On the way we met a bus; Hans pointed it out to me, saying: "Look! a stork-box cart!" If he goes with me to the Stadtpark again to-morrow, as we have planned, we shall really be able to regard his illness as cured.

'On May 2nd Hans came to me in the morning. "I say," he said, "I thought something to-day." At first he had forgotten it; but later on he related what follows, though with signs of considerable resistance: "*The plumber came; and first he took away my behind with a pair of pincers, and then gave me another, and then the same with my widdler.*" He said: 'Let me see your behind!' and I had to turn round, and he took it away; and then he said: 'Let me see your widdler!'"

Hans's father grasped the nature of this wishful phantasy, and did not hesitate a moment as to the only interpretation it could bear.

'I: "He gave you a *bigger* widdler and a *bigger* behind."

'Hans: "Yes."

'I: "Like Daddy's; because you'd like to be Daddy."

'Hans: "Yes, and I'd like to have a moustache like yours and hairs like yours." (He pointed to the hairs on my chest.)

'In the light of this, we may review the interpretation of Hans's earlier phantasy to the effect that the plumber had come and unscrewed the bath and had stuck a borer into his stomach. The big bath meant a "behind", the borer or screwdriver was (as was explained at the time) a widdler.¹ The two phantasies are identical. Moreover, a new light is thrown upon Hans's fear of the big bath. (This, by the way, has already diminished.) He dislikes his "behind" being too small for the big bath.'

In the course of the next few days Hans's mother wrote to me more than once to express her joy at the little boy's recovery.

¹ Perhaps, too, the word 'borer' ['*Bohrer*'] was not chosen without regard for its connection with 'born' ['*geboren*'] and 'birth' ['*Geburt*']. If so, the child could have made no distinction between 'bored' ['*gebohrt*'] and 'born' ['*geboren*']. I accept this suggestion, made by an experienced fellow-worker, but I am not in a position to say whether we have before us here a deep and universal connection between the two ideas or merely the employment of a verbal coincidence peculiar to German. Prometheus (Pramantha), the creator of man, is also etymologically 'the borer'. (Cf. Abraham, *Traum und Mythos*, 1909.)

A week later came a postscript from Hans's father.

'My dear Professor, I should like to make the following additions to Hans's case history:

'(1) The remission after he had been given his first piece of enlightenment was not so complete as I may have represented it. It is true that Hans went for walks; but only under compulsion and in a state of great anxiety. Once he went with me as far as the Hauptzollamt station, from which our house can still be seen, but could not be induced to go any farther.

'(2) As regards "raspberry syrup" and "a gun for shooting with". Hans is given raspberry syrup when he is constipated. He also frequently confuses the words "shooting" and "shitting".¹

'(3) Hans was about four years old when he was moved out of our bedroom into a room of his own.

'(4) A trace of his disorder still persists, though it is no longer in the shape of fear but only in that of the normal instinct for asking questions. The questions are mostly concerned with what things are made of (trams, machines, etc.), who makes things, etc. Most of his questions are characterized by the fact that Hans asks them although he has already answered them himself. He only wants to make sure. Once when he had tired me out with his questions and I had said to him: "Do you think I can answer every question you ask?" he replied: "Well, I thought as you knew that about the horse you'd know this too."

'(5) Hans only refers to his illness now as a matter of past history - "at the time when I had my nonsense".

'(6) An unsolved residue remains behind; for Hans keeps cudgelling his brains to discover what a father has to do with his child, since it is the mother who brings it into the world. This can be seen from his questions, as, for instance: "I belong to *you*, too, don't I?" (meaning, not only to his mother). It is not clear to him in what way he belongs to me. On the other hand, I have no direct evidence of his having, as you suppose, overheard his parents in the act of intercourse.

'(7) In presenting the case one ought perhaps to insist upon the violence of his anxiety. Otherwise it might be said that the boy would have gone out for walks soon enough if he had been given a sound thrashing.'

¹ [In German '*schliessen*' and '*scheissen*'.]

In conclusion let me add these words. With Hans's last phantasy the anxiety which arose from his castration complex was also overcome, and his painful expectations were given a happier turn. Yes, the Doctor (the plumber) *did* come, he *did* take away his penis, - but only to give him a bigger one in exchange for it. For the rest, our young investigator has merely come somewhat early upon the discovery that all knowledge is patchwork, and that each step forward leaves an unsolved residue behind.

III

DISCUSSION

I shall now proceed to examine this observation of the development and resolution of a phobia in a boy under five years of age, and I shall have to do so from three points of view. In the first place I shall consider how far it supports the assertions which I put forward in my *Three Essays on the Theory of Sexuality* (1905d). Secondly, I shall consider to what extent it can contribute towards our understanding of this very frequent form of disorder. And thirdly, I shall consider whether it can be made to shed any light upon the mental life of children or to afford any criticism of our educational aims.

(I)

My impression is that the picture of a child's sexual life presented in this observation of little Hans agrees very well with the account I gave of it (basing my views upon psycho-analytic examinations of adults) in my *Three Essays*. But before going into the details of this agreement I must deal with two objections which will be raised against my making use of the present analysis for this purpose. The first objection is to the effect that Hans was not a normal child, but (as events - the illness itself, in fact - showed) had a predisposition to neurosis, and was a young 'degenerate'; it would be illegitimate, therefore, to apply to other, normal children conclusions which might perhaps be true of him. I shall postpone consideration of this objection, since it only limits the value of the observation, and does not completely nullify it. According to the second and more uncompromising objection, an analysis of a child conducted by his father, who went to work instilled with *my* theoretical views and infected with *my* prejudices, must be entirely devoid of any objective worth. A child, it will be said, is necessarily highly suggestible, and in regard to no one, perhaps, more than to his own father; he will allow anything to be forced upon him, out of gratitude to his father for taking so much notice of him; none of his assertions can have any evidential value, and everything he produces in the way of associations, phantasies, and dreams will naturally take the direction into which they are being urged by every possible means. Once more, in short, the whole thing is simply 'suggestion' - the only difference being that in the case of a child it can be unmasked much more easily than in that of an adult.

A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects. Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises, - it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psycho-analysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

Little Hans is described by his parents as a cheerful, straightforward child, and so he should have been, considering the education given him by his parents, which consisted essentially in the omission of our usual educational sins. So long as he was able to carry on his researches in a state of happy *naïveté*, without a suspicion of the conflicts which were soon to arise out of them, he kept nothing back; and the observations made during the period before the phobia admit of no doubt or demur. It was with the outbreak of the illness and during the analysis that discrepancies began to make their appearance between what he said and what he thought; and this was partly because unconscious material, which he was unable to master all at once, was forcing itself upon him, and partly because the content of his thoughts provoked reservations on account of his relation to his parents. It is my unbiased opinion that these difficulties, too, turned out no greater than in many analyses of adults.

It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

And yet, even during the analysis, the small patient gave evidence of enough independence to acquit him upon the charge of 'suggestion'. Like all other children, he applied his childish sexual theories to the material before him without having received any encouragement to do so. These theories are extremely remote from the adult mind. Indeed, in this instance I actually omitted to warn Hans's father that the boy would be bound to approach the subject of childbirth by way of the excretory complex. This negligence on my part, though it led to an obscure phase in the analysis, was nevertheless the means of producing a good piece of evidence of the genuineness and independence of Hans's mental processes. He suddenly became occupied with 'lumpf', without his father, who is supposed to have been practising suggestion upon him, having the least idea how he had arrived at that subject or what was going to come of it. Nor can his father be saddled with any responsibility for the production of the two plumber phantasies, which arose out of Hans's early acquired 'castration complex'. And I must here confess that, out of theoretical interest, I entirely concealed from Hans's father my expectation that there would turn out to be some such connection, so as not to interfere with the value of a piece of evidence such as does not often come within one's grasp.

If I went more deeply into the details of the analysis I could produce plenty more evidence of Hans's independence of 'suggestion'; but I shall break off the discussion of this preliminary objection at this point. I am aware that even with this analysis I shall not succeed in convincing any one who will not let himself be convinced, and I shall proceed with my discussion of the case for the benefit of those readers who are already convinced of the objective reality of unconscious pathogenic material. And I do this with the agreeable assurance that the number of such readers is steadily increasing.

The first trait in little Hans which can be regarded as part of his sexual life was a quite peculiarly lively interest in his 'widdler' - an organ deriving its name from that one of its two functions which, scarcely the less important of the two, is not to be eluded in the nursery. This interest aroused in him the spirit of enquiry, and he thus discovered that the presence or absence of a widdler made it possible to differentiate between animate and inanimate objects. He assumed that all animate objects were like himself, and possessed this important bodily organ; he observed that it was present in the larger animals, suspected that this was so too in both his parents, and was not deterred by the evidence of his own eyes from authenticating the fact in his new-born sister. One might almost say that it would have been too shattering a blow to his '*Weltanschauung*' if he had had to make up his mind to forgo the presence of this organ in a being similar to him; it would have been as though it were being torn away from himself. It was probably on this account that a threat of his mother's, which was concerned precisely with the loss of his widdler, was hastily dismissed from his thoughts and only succeeded in making its effects apparent at a later period. The reason for his mother's intervention had been that he used to like giving himself feelings of pleasure by touching his member: the little boy had begun to practise the commonest - and most normal - form of auto-erotic sexual activity.

The pleasure which a person takes in his own sexual organ may become associated with scopophilia (or sexual pleasure in looking) in its active and passive forms, in a manner which has been very aptly described by Alfred Adler (1908) as 'confluence of instincts'. So little Hans began to try to get a sight of other people's widdlers; his sexual curiosity developed, and at the same time he liked to exhibit his own widdler. One of his dreams, dating from the beginning of his period of repression, expressed a wish that one of his little girl friends should assist him in widdling, that is, that she should share the spectacle. The dream shows, therefore, that up till then this wish had subsisted unrepressed, and later information confirmed the fact that he had been in the habit of gratifying it. The active side of his sexual scopophilia soon became associated in him with a definite theme. He repeatedly expressed both to his father and his mother his regret that he had never yet seen their widdlers; and it was probably the need *for making a comparison* which impelled him to do this. The ego is always the standard by which one measures the external world; one learns to understand it by means of a constant comparison with oneself. Hans had observed that large animals had widdlers that were correspondingly larger than his; he consequently suspected that the same was true of his parents, and was anxious to make sure of this. His mother, he thought, must certainly have a widdler 'like a horse'. He was then prepared with the comforting reflection that his widdler would grow with him. It was as though the child's wish to be bigger had been concentrated on his genitals.

Thus in little Hans's sexual constitution the genital zone was from the outset the one among his erotogenic zones which afforded him the most intense pleasure. The only other similar pleasure of which he gave evidence was excretory pleasure, the pleasure attached to the orifices through which micturition and evacuation of the bowels are effected. In his final phantasy of bliss, with which his illness was overcome, he imagined he had children, whom he took to the W.C., whom he made to widdle, whose behinds he wiped - for whom, in short, he did 'everything one can do with children'; it therefore seems impossible to avoid the assumption that during the period when he himself had been looked after as an infant these same performances had been the source of pleasurable sensations for him. He had obtained this pleasure from his erotogenic zones with the help of the person who had looked after him - his mother, in fact; and thus the pleasure already pointed the way to object-choice. But it is just possible that at a still earlier date he had been in the habit of giving himself this pleasure auto-erotically - that he had been one of those children who like retaining their excreta till they can derive a voluptuous sensation from their evacuation. I say no more than that it is possible, because the matter was not cleared up in the analysis; the 'making a row with the legs' (kicking about), of which he was so much frightened later on, points in that direction. But in any case these sources of pleasure had no particularly striking importance with Hans, as they so often have with other children. He early became clean in his habits, and neither bed-wetting nor diurnal incontinence played any part during his first years; no trace was observed in him of any inclination to play with his excrement, a propensity which is so revolting in adults, and which commonly makes its reappearance at the termination of processes of psychical involution.

At this juncture it is as well to emphasize at once the fact that during his phobia there was an unmistakable repression of these two well-developed components of his sexual activity. He was ashamed of micturating before other people, accused himself of putting his finger to his widdler, made efforts to give up masturbating, and showed disgust at 'lump' and 'widdle' and everything that reminded him of them. In his phantasy of looking after his children he undid this latter repression.

A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.¹ Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.

¹ As my expectations led me to suppose, and as Sadger's observations have shown, all such people pass through an amphigenic phase in childhood.

There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that *he was acquainted with only one kind of genital organ* - a genital organ like his own.¹

¹ [*Footnote added 1923:*] I have subsequently (1923e) drawn attention to the fact that the period of sexual development which our little patient was passing through is universally characterized by acquaintance with only *one* sort of genital organ, namely, the male one. In contrast to the later period of maturity, this period is marked not by a *genital* primacy but by a primacy of the *phallus*.

In his subsequent development, however, it was not to homosexuality that our young libertine proceeded, but to an energetic masculinity with traits of polygamy; he knew how to vary his behaviour, too, with his varying feminine objects - audaciously aggressive in one case, languishing and bashful in another. His affection had moved from his mother on to other objects of love, but at a time when there was a scarcity of these it returned to her, only to break down in a neurosis. It was not until this happened that it became evident to what a pitch of intensity his love for his mother had developed and through what vicissitudes it had passed. The sexual aim which he pursued with his girl playmates, of sleeping with them, had originated in relation to his mother. It was expressed in words which might be retained in maturity, though they would then bear a richer connotation.¹ The boy had found his way to object-love in the usual manner from the care he had received when he was an infant; and a new pleasure had now become the most important for him - that of sleeping beside his mother. I should like to emphasize the importance of pleasure derived from cutaneous contact as a component in this new aim of Hans's, which, according to the nomenclature (artificial to my mind) of Moll, would have to be described as satisfaction of the instinct of contrectation.

¹ [The German '*bei jemandem schlafen*', literally 'to sleep with some one', is used (like the English 'to lie with') in the sense of 'to copulate with'.]

In his attitude towards his father and mother Hans confirms in the most concrete and uncompromising manner what I have said in my *Interpretation of Dreams* and in my *Three Essays* with regard to the sexual relations of a child to his parents. Hans really was a little Oedipus who wanted to have his father 'out of the way', to get rid of him, so that he might be alone with his beautiful mother and sleep with her. This wish had originated during his summer holidays, when the alternating presence and absence of his father had drawn Hans's attention to the condition upon which depended the intimacy with his mother which he longed for. At that time the form taken by the wish had been merely that his father should 'go away'; and at a later stage it became possible for his fear of being bitten by a white horse to attach itself directly on to this form of the wish, owing to a chance impression which he received at the moment of some one else's departure. But subsequently (probably not until they had moved back to Vienna, where his father's absences were no longer to be reckoned on) the wish had taken the form that his father should be *permanently* away - that he should be 'dead'. The fear which sprang from this death-wish against his father, and which may thus be said to have had a normal motive, formed the chief obstacle to the analysis until it was removed during the conversation in my consulting-room.¹

¹ It is quite certain that Hans's two associations, 'raspberry syrup' and 'a gun for shooting people dead with' must have had more than one set of determinants. They probably had just as much to do with his hatred of his father as with his constipation complex. His father, who himself guessed the latter connection, also suggested that 'raspberry syrup' might be related to 'blood'.

But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was *suppressed* sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

¹ His wanting to beat and tease horses.

² See the critical question he addressed to his father (p. 2033).

³ Das heisst, ich bin kein ausgeklügelt Buch.
Ich bin ein Mensch mit seinem Widerspruch.
C. F. Meyer, *Huttens letzte Tage*.

[In fact, I am no clever work of fiction;
I am a man, with all his contradiction.]

The most important influence upon the course of Hans's psychosexual development was the birth of a baby sister when he was three and a half years old. That event accentuated his relations to his parents and gave him some insoluble problems to think about; and later, as he watched the way in which the infant was looked after, the memory-traces of his own earliest experiences of pleasure were revived in him. This influence, too, is a typical one: in an unexpectedly large number of life-histories, normal as well as pathological, we find ourselves obliged to take as our starting-point an outburst of sexual pleasure and sexual curiosity connected, like this one, with the birth of the next child. Hans's behaviour towards the new arrival was just what I have described in *The Interpretation of Dreams*. In his fever a few days later he betrayed how little he liked the addition to the family. Affection for his sister might come later,¹ but his first attitude was hostility. From that time forward fear that yet another baby might arrive found a place among his conscious thoughts. In the neurosis, his hostility, already suppressed, was represented by a special fear - a fear of the bath. In the analysis he gave undisguised expression to his death-wish against his sister, and was not content with allusions which required supplementing by his father. His inner conscience did not consider this wish so wicked as the analogous one against his father; but it is clear that in his unconscious he treated both persons in the same way, because they both took his mummy away from him, and interfered with his being alone with her.

Moreover, this event and the feelings that were revived by it gave a new direction to his wishes. In his triumphant final phantasy he summed up all of his erotic wishes, both those derived from his auto-erotic phase and those connected with his object-love. In that phantasy he was married to his beautiful mother and had innumerable children whom he could look after in his own way.

¹ Cf. his plans of what he would do when his sister was old enough to speak (p. 2060).

(II)

One day while Hans was in the street he was seized with an attack of anxiety. He could not yet say what it was he was afraid of; but at the very beginning of this anxiety-state he betrayed to his father his motive for being ill, the advantage he derived from it. He wanted to stay with his mother and to coax with her; his recollection that he had also been separated from her at the time of the baby's birth may also, as his father suggests, have contributed to his longing. It soon became evident that his anxiety was no longer reconvertible into longing; he was afraid even when his mother went with him. In the meantime indications appeared of what it was to which his libido (now changed into anxiety) had become attached. He gave expression to the quite specific fear that a white horse would bite him.

Disorders of this kind are called 'phobias', and we might classify Hans's case as an agoraphobia if it were not for the fact that it is a characteristic of that complaint that the locomotion of which the patient is otherwise incapable can always be easily performed when he is accompanied by some specially selected person - in the last resort, by the physician. Hans's phobia did not fulfil this condition; it soon ceased having any relation to the question of locomotion and became more and more clearly concentrated upon horses. In the early days of his illness, when the anxiety was at its highest pitch, he expressed a fear that 'the horse'll come into the room', and it was this that helped me so much towards understanding his condition.

In the classificatory system of the neuroses no definite position has hitherto been assigned to 'phobias'. It seems certain that they should only be regarded as syndromes which may form part of various neuroses and that we need not rank them as an independent pathological process. For phobias of the kind to which little Hans's belongs, and which are in fact the most common, the name of 'anxiety-hysteria' seems to me not inappropriate; I suggested the term to Dr. W. Stekel when he was undertaking a description of neurotic anxiety states,¹ and I hope it will come into general use. It finds its justification in the similarity between the psychological structure of these phobias and that of hysteria - a similarity which is complete except upon a single point. That point, however, is a decisive one and well adapted for purposes of differentiation. For in anxiety-hysteria the libido which has been liberated from the pathogenic material by repression is not *converted* (that is, diverted from the mental sphere into a somatic innervation), but is set free. In the clinical cases that we meet with, this 'anxiety-hysteria' may be combined with 'conversion-hysteria' in any proportion. There exist cases of pure conversion-hysteria without any trace of anxiety, just as there are cases of simple anxiety-hysteria, which exhibit feelings of anxiety and phobias, but have no admixture of conversion. The case of little Hans is one of the latter sort.

¹ *Nervöse Angstzustände und ihre Behandlung*, 1908.

Anxiety-hysterias are the most common of all psychoneurotic disorders. But, above all, they are those which make their appearance earliest in life; they are *par excellence* the neuroses of childhood. When a mother uses such phrases as that her child's 'nerves' are in a bad state, we can be certain that in nine cases out of ten the child is suffering from some kind of anxiety or from many kinds at once. Unfortunately the finer mechanism of these highly significant disorders has not yet been sufficiently studied. It has not yet been established whether anxiety-hysteria is determined, in contradistinction to conversion-hysteria and other neuroses, solely by constitutional factors or solely by accidental experiences, or by what combination of the two.¹ It seems to me that of all neurotic disorders it is the least dependent upon a special constitutional predisposition and that it is consequently the most easily acquired at any time of life.

One essential characteristic of anxiety-hysterias is very easily pointed out. An anxiety-hysteria tends to develop more and more into a 'phobia'. In the end the patient may have got rid of all his anxiety, but only at the price of subjecting himself to all kinds of inhibitions and restrictions. From the outset in anxiety-hysteria the mind is constantly at work in the direction of once more psychically binding the anxiety which has become liberated; but this work can neither bring about a retransformation of the anxiety into libido, nor can it establish any contact with the complexes which were the source of the libido. Nothing is left for it but to cut off access to every possible occasion that might lead to the development of anxiety, by erecting mental barriers in the nature of precautions, inhibitions, or prohibitions; and it is these defensive structures that appear to us in the form of phobias and that constitute to our eyes the essence of the disease.

The treatment of anxiety-hysteria may be said hitherto to have been a purely negative one. Experience has shown that it is impossible to effect the cure of a phobia (and even in certain circumstances dangerous to attempt to do so) by violent means, that is, by first depriving the patient of his defences and then putting him in a situation in which he cannot escape the liberation of his anxiety. Consequently, nothing can be done but to leave the patient to look for protection wherever he thinks he may find it; and he is merely regarded with a not very helpful contempt for his 'incomprehensible cowardice'.

Little Hans's parents were determined from the very beginning of his illness that he was neither to be laughed at nor bullied, but that access must be obtained to his repressed wishes by means of psycho-analysis. The extraordinary pains taken by Hans's father were rewarded by success, and his reports will give us an opportunity of penetrating into the fabric of this type of phobia and of following the course of its analysis.

¹ [Footnote added 1923:] The question which is raised here has not been pursued further. But there is no reason to suppose that anxiety-hysteria is an exception to the rule that both predisposition and experience must co-operate in the aetiology of a neurosis. Rank's view of the effects of the trauma of birth seems to throw special light upon the predisposition to anxiety-hysteria which is so strong in childhood.

I think it is not unlikely that the extensive and detailed character of the analysis may have made it somewhat obscure to the reader. I shall therefore begin by giving a brief resume of it, in which I shall omit all distracting side-issues and shall draw attention to the results as they came to light one after the other.

The first thing we learn is that the outbreak of the anxiety state was by no means so sudden as appeared at first sight. A few days earlier the child had woken from an anxiety-dream to the effect that his mother had gone away, and that now he had no mother to coax with. This dream alone points to the presence of a repressive process of ominous intensity. We cannot explain it, as we can so many other anxiety-dreams, by supposing that the child had in his dream felt anxiety arising from some somatic cause and had made use of the anxiety for the purpose of fulfilling an unconscious wish which would otherwise have been deeply repressed.¹ We must regard it rather as a genuine punishment and repression dream, and, moreover, as a dream which failed in its function, since the child woke from his sleep in a state of anxiety. We can easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging endearments with his mother and of sleeping with her; but all the pleasure was transformed into anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of the mechanism of dreaming.

But the beginnings of this psychological situation go back further still. During the preceding summer Hans had had similar moods of mingled longing and apprehension, in which he had said similar things; and at that time they had secured him the advantage of being taken by his mother into her bed. We may assume that since then Hans had been in a state of intensified sexual excitement, the object of which was his mother. The intensity of this excitement was shown by his two attempts at seducing his mother (the second of which occurred just before the outbreak of his anxiety); and he found an incidental channel of discharge for it by masturbating every evening and in that way obtaining gratification. Whether the sudden change-over of this excitement into anxiety took place spontaneously, or as a result of his mother's rejection of his advances, or owing to the accidental revival of earlier impressions by the 'precipitating cause' of his illness (about which we shall hear presently) - this we cannot decide; and, indeed, it is a matter of indifference, for these three alternative possibilities cannot be regarded as mutually incompatible. The fact remains that his sexual excitement suddenly changed into anxiety.

¹ See my *Interpretation of Dreams*.

We have already described the child's behaviour at the beginning of his anxiety, as well as the first content which he assigned to it, namely, that a horse would bite him. It was at this point that the first piece of therapy was interposed. His parents represented to him that his anxiety was the result of masturbation, and encouraged him to break himself of the habit. I took care that when they spoke to him great stress was laid upon his affection for his mother, for that was what he was trying to replace by his fear of horses. This first intervention brought a slight improvement, but the ground was soon lost again during a period of physical illness. Hans's condition remained unchanged. Soon afterwards he traced back his fear of being bitten by a horse to an impression he had received at Gmunden. A father had addressed his child on her departure with these words of warning: 'Don't put your finger to the horse; if you do, it'll bite you.' The words, 'don't put your finger to', which Hans used in reporting this warning, resembled the form of words in which the warning against masturbation had been framed. It seemed at first, therefore, as though Hans's parents were right in supposing that what he was frightened of was his own masturbatory indulgence. But the whole nexus remained loose, and it seemed to be merely by chance that horses had become his bugbear.

I had expressed a suspicion that Hans's repressed wish might now be that he wanted at all costs to see his mother's widdler. As his behaviour to a new maid fitted in with this hypothesis, his father gave him his first piece of enlightenment, namely, that women have no widdlers. He reacted to this first effort at helping him by producing a phantasy that he had seen his mother showing her widdler.¹ This phantasy and a remark made by him in conversation, to the effect that his widdler was 'fixed in, of course', allow us our first glimpse into the patient's unconscious mental processes. The fact was that the threat of castration made to him by his mother some fifteen months earlier was now having a deferred effect upon him. For his phantasy that his mother was doing the same as he had done (the familiar *tu quoque* repartee of inculpated children) was intended to serve as a piece of self-justification; it was a protective or defensive phantasy. At the same time we must remark that it was Hans's parents who had extracted from the pathogenic material operating in him the particular theme of his interest in widdlers. Hans followed their lead in this matter, but he had not yet taken any line of his own in the analysis. And no therapeutic success was to be observed. The analysis had passed far away from the subject of horses; and the information that women have no widdlers was calculated, if anything, to increase his concern for the preservation of his own.

¹ [Footnote added 1924:] The context enables us to add: 'and touching it' (p. 2024). After all, he himself could not show his widdler without touching it.

Therapeutic success, however, is not our primary aim; we endeavour rather to enable the patient to obtain a conscious grasp of his unconscious wishes. And this we can achieve by working upon the basis of the hints he throws out, and so, with the help of our interpretative technique, presenting the unconscious complex to his consciousness *in our own words*. There will be a certain degree of similarity between that which he hears from us and that which he is looking for, and which, in spite of all resistances, is trying to force its way through to consciousness; and it is this similarity that will enable him to discover the unconscious material. The physician is a step in front of him in knowledge; and the patient follows along his own road, until the two meet at the appointed goal. Beginners in psycho-analysis are apt to assimilate these two events, and to suppose that the moment at which one of the patient's unconscious complexes has become known to *them* is also the moment at which the patient himself recognizes it. They are expecting too much when they think that they will cure the patient by informing him of this piece of knowledge; for he can do no more with the information than make use of it to help himself in discovering the unconscious complex *where it is anchored* in his unconscious. A first success of this sort had now been achieved with Hans. Having partly mastered his castration complex, he was now able to communicate his wishes in regard to his mother. He did so, in what was still a distorted form, by means of the *phantasy of the two giraffes*, one of which was calling out in vain because Hans had taken possession of the other. He represented the 'taking possession of' pictorially as 'sitting down on'. His father recognized the phantasy as a reproduction of a bedroom scene which used to take place in the morning between the boy and his parents; and he quickly stripped the underlying wish of the disguise which it still wore. The boy's father and mother were the two giraffes. The reason for the choice of a giraffe-phantasy for the purposes of disguise was fully explained by a visit that the boy had paid to those same large beasts at Schönbrunn a few days earlier, by the giraffe-drawing, belonging to an earlier period, which had been preserved by his father, and also, perhaps, by an unconscious comparison based upon the giraffe's long, stiff neck.¹ It may be remarked that the giraffe, as being a large animal and interesting on account of its widdler, was a possible competitor with the horse for the role of bugbear; moreover, the fact that both his father and his mother appeared as giraffes offered a hint which had not yet been followed up, as regards the interpretation of the anxiety-horses.

¹ Hans's admiration of his father's neck later on would fit in with this.

Immediately after the giraffe story Hans produced two minor phantasies: one of his forcing his way into a forbidden space at Schönbrunn, and the other of his smashing a railway-carriage window on the Stadtbahn. In each case the punishable nature of the action was emphasized, and in each his father appeared as an accomplice. Unluckily his father failed to interpret either of these phantasies, so that Hans himself gained nothing from telling them. In an analysis, however, a thing which has not been understood inevitably reappears; like an unlaidd ghost, it cannot rest until the mystery has been solved and the spell broken.

There are no difficulties in the way of our understanding these two criminal phantasies. They belonged to Hans's complex of taking possession of his mother. Some kind of vague notion was struggling in the child's mind of something that he might do with his mother by means of which his taking possession of her would be consummated; for this elusive thought he found certain pictorial representations, which had in common the qualities of being violent and forbidden, and the content of which strikes us as fitting in most remarkably well with the hidden truth. We can only say that they were symbolic phantasies of intercourse, and it was no irrelevant detail that his father was represented as sharing in his actions: 'I should like', he seems to have been saying, 'to be doing something with my mother, something forbidden; I do not know what it is, but I do know that you are doing it too.'

The giraffe phantasy strengthened a conviction which had already begun to form in my mind when Hans expressed his fear that 'the horse'll come into the room'; and I thought the right moment had now arrived for informing him that he was afraid of his father because he himself nourished jealous and hostile wishes against him - for it was essential to postulate this much with regard to his unconscious impulses. In telling him this, I had partly interpreted his fear of horses for him: the horse must be his father - whom he had good internal reasons for fearing. Certain details of which Hans had shown he was afraid, the black on horses' mouths and the things in front of their eyes (the moustaches and eyeglasses which are the privilege of a grown-up man), seemed to me to have been directly transposed from his father on to the horses.

By enlightening Hans on this subject I had cleared away his most powerful resistance against allowing his unconscious thoughts to be made conscious; for his father was himself acting as his physician. The worst of the attack was now over; there was a plentiful flow of material; the little patient summoned up courage to describe the details of his phobia, and soon began to take an active share in the conduct of the analysis.¹

¹ Even in analyses in which the physician and the patient are strangers, fear of the father plays one of the most important parts as a resistance against the reproduction of the unconscious pathogenic material. Resistances are sometimes in the nature of 'motifs'. But sometimes, as in the present instance, one piece of the unconscious material is capable from its actual *content* of operating as an inhibition against the reproduction of another piece.

It was only then that we learnt what the objects and impressions were of which Hans was afraid. He was not only afraid of horses biting him - he was soon silent upon that point - but also of carts, of furniture-vans, and of buses (their common quality being, as presently became clear, that they were all heavily loaded), of horses that started moving, of horses that looked big and heavy, and of horses that drove quickly. The meaning of these specifications was explained by Hans himself: he was afraid of horses *falling down*, and consequently incorporated in his phobia everything that seemed likely to facilitate their falling down.

It not at all infrequently happens that it is only after doing a certain amount of psycho-analytic work with a patient that an analyst can succeed in learning the actual content of a phobia, the precise form of words of an obsessional impulse, and so on. Repression has not only descended upon the unconscious complexes, but it is continually attacking their derivatives as well, and even prevents the patient from becoming aware of the products of the disease itself. The analyst thus finds himself in the position, curious for a doctor, of coming to the help of a disease, and of procuring it its due of attention. But only those who entirely misunderstand the nature of psycho-analysis will lay stress upon this phase of the work and suppose that on its account harm is likely to be done by analysis. The fact is that you must catch your thief before you can hang him, and that it requires some expenditure of labour to get securely hold of the pathological structures - at the destruction of which the treatment is aimed.

I have already remarked in the course of my running commentary on the case history that it is most instructive to plunge in this way into the details of a phobia, and thus arrive at a conviction of the secondary nature of the relation between the anxiety and its objects. It is this that accounts for phobias being at once so curiously diffuse and so strictly conditioned. It is evident that the material for the particular disguises which Hans's fear adopted was collected from the impressions to which he was all day long exposed owing to the Head Customs House being situated on the opposite side of the street. In this connection, too, he showed signs of an impulse - though it was now inhibited by his anxiety - to play with the loads on the carts, with the packages, casks and boxes, like the street-boys.

It was at this stage of the analysis that he recalled the event, insignificant in itself, which immediately preceded the outbreak of the illness and may no doubt be regarded as the precipitating cause of its outbreak. He went for a walk with his mother, and saw a bus-horse fall down and kick about with its feet. This made a great impression on him. He was terrified, and thought the horse was dead; and from that time on he thought that all horses would fall down. His father pointed out to him that when he saw the horse fall down he must have thought of him, his father, and have wished that he might fall down in the same way and be dead. Hans did not dispute this interpretation; and a little while later he played a game consisting of biting his father, and so showed that he accepted the theory of his having identified his father with the horse he was afraid of. From that time forward his behaviour to his father was unconstrained and fearless, and in fact a trifle overbearing. Nevertheless his fear of horses persisted; nor was it yet clear through what chain of associations the horse's falling down had stirred up his unconscious wishes.

Let me summarize the results that had so far been reached. Behind the fear to which Hans first gave expression, the fear of a horse biting him, we had discovered a more deeply seated fear, the fear of horses falling down; and both kinds of horses, the biting horse and the falling horse, had been shown to represent his father, who was going to punish him for the evil wishes he was nourishing against him. Meanwhile the analysis had moved away from the subject of his mother.

Quite unexpectedly, and certainly without any prompting from his father, Hans now began to be occupied with the 'lump' complex, and to show disgust at things that reminded him of evacuating his bowels. His father, who was reluctant to go with him along that line, pushed on with the analysis through thick and thin in the direction in which he wanted to go. He elicited from Hans the recollection of an event at Gmunden, the impression of which lay concealed behind that of the falling bus-horse. While they were playing at horses, Fritzl, the playmate of whom he was so fond, but at the same time, perhaps, his rival with his many girl friends, had hit his foot against a stone and had fallen down, and his foot had bled. Seeing the bus-horse fall had reminded him of this accident. It deserves to be noticed that Hans, who was at the moment concerned with other things, began by denying that Fritzl had fallen down (though this, was the event which formed the connection between the two scenes) and only admitted it at a later stage of the analysis. It is especially interesting, however, to observe the way in which the transformation of Hans's libido into anxiety was projected on to the principal object of his phobia, on to horses. Horses interested him the most of all the large animals; playing at horses was his favourite game with the other children. I had a suspicion - and this was confirmed by Hans's father when I asked him - that the first person who had served Hans as a horse must have been his father; and it was this that had enabled him to regard Fritzl as a substitute for his father when the accident happened at Gmunden. When repression had set in and brought a revulsion of feeling along with it, horses, which had till then been associated with so much pleasure, were necessarily turned into objects of fear.

But, as we have already said, it was owing to the intervention of Hans's father that this last important discovery was made of the way in which the precipitating cause of the illness had operated. Hans himself was occupied with his lumbic interests, and thither at last we must follow him. We learn that formerly Hans had been in the habit of insisting upon accompanying his mother to the W. C., and that he had revived this custom with his friend Berta at a time when she was filling his mother's place, until the fact became known and he was forbidden to do so. Pleasure taken in looking on while some one one loves performs the natural functions is once more a 'confluence of instincts', of which we have already noticed an instance in Hans. In the end his father went into the lumbic symbolism, and recognized that there was an analogy between a heavily loaded cart and a body loaded with faeces, between the way in which a cart drives out through a gateway and the way in which faeces leave the body, and so on.

By this time, however, the position occupied by Hans in the analysis had become very different from what it had been at an earlier stage. Previously, his father had been able to tell him in advance what was coming, while Hans had merely followed his lead and come trotting after; but now it was Hans who was forging ahead, so rapidly and steadily that his father found it difficult to keep up with him. Without any warning, as it were, Hans produced a new phantasy: the plumber unscrewed the bath in which Hans was, and then stuck him in the stomach with his big borer. Henceforward the material brought up in the analysis far outstripped our powers of understanding it. It was not until later that it was possible to guess that this was a remoulding of a *phantasy of procreation*, distorted by anxiety. The big bath of water, in which Hans imagined himself, was his mother's womb; the 'borer', which his father had from the first recognized as a penis, owed its mention to its connection with 'being born'. The interpretation that we are obliged to give to the phantasy will of course sound very curious: 'With your big penis you "bored" me' (i.e. 'gave birth to me') 'and put me in my mother's womb.' For the moment, however, the phantasy eluded interpretation, and merely served Hans as a starting point from which to continue giving information.

Hans showed fear of being given a bath in the big bath; and this fear was once more a composite one. One part of it escaped us as yet, but the other part could at once be elucidated in connection with his baby sister having her bath. Hans confessed to having wished that his mother might drop the child while she was being given her bath, so that she should die. His own anxiety while he was having his bath was a fear of retribution for this evil wish and of being punished by the same thing happening to him. Hans now left the subject of lumf and passed on directly to that of his baby sister. We may well imagine what this juxtaposition signified: nothing less, in fact, than that little Hanna was a lumf herself - that all babies were lumfs and were born like lumfs. We can now recognize that all furniture-vans and drays and buses were only stork-box carts, and were only of interest to Hans as being symbolic representations of pregnancy; and that when a heavy or heavily loaded horse fell down he can have seen in it only one thing - a childbirth, a delivery [*ein Niederkommen*]. Thus the falling horse was not only his dying father but also his mother in childbirth.

And at this point Hans gave us a surprise, for which we were not in the very least prepared. He had noticed his mother's pregnancy, which had ended with the birth of his little sister when he was three and a half years old, and had, at any rate after the confinement, pieced the facts of the case together - without telling any one, it is true, and perhaps without being able to tell any one. All that could be seen at the time was that immediately after the delivery he had taken up an extremely sceptical attitude towards everything that might be supposed to point to the presence of the stork. *But that - in complete contradiction to his official speeches - he knew in his unconscious where the baby came from and where it had been before*, is proved beyond a shadow of doubt by the present analysis; indeed, this is perhaps its most unassailable feature.

The most cogent evidence of this is furnished by the phantasy (which he persisted in with so much obstinacy, and embellished with such a wealth of detail) of how Hanna had been with them at Gmunden the summer before her birth, of how she had travelled there with them, and of how she had been able to do far more than she had a year later, after she had been born. The effrontery with which Hans related this phantasy and the countless extravagant lies with which he interwove it were anything but meaningless. All of this was intended as a revenge upon his father, against whom he harboured a grudge for having misled him with the stork fable. It was just as though he had meant to say: 'If you really thought I was as stupid as all that, and expected me to believe that the stork brought Hanna, then in return I expect *you* to accept *my* inventions as the truth.' This act of revenge on the part of our young enquirer upon his father was succeeded by the clearly correlated phantasy of teasing and beating horses. This phantasy, again, had two constituents. On the one hand, it was based upon the teasing to which he had submitted his father just before; and, on the other hand, it reproduced the obscure sadistic desires directed towards his mother, which had already found expression (though they had not at first been understood) in his phantasies of doing something forbidden. Hans even confessed consciously to a desire to beat his mother.

There are not many more mysteries ahead of us now. An obscure phantasy of missing a train seems to have been a forerunner of the later notion of handing over Hans's father to his grandmother at Lainz, for the phantasy dealt with a visit to Lainz, and his grandmother appeared in it. Another phantasy, in which a boy gave the guard 50,000 florins to let him ride on the truck, almost sounds like a plan of buying his mother from his father, part of whose power, of course, lay in his wealth. At about this time, too, he confessed, with a degree of openness which he had never before reached, that he wished to get rid of his father, and that the reason he wished it was that his father interfered with his own intimacy with his mother. We must not be surprised to find the same wishes constantly reappearing in the course of an analysis. The monotony only attaches to the analyst's interpretations of these wishes. For Hans they were not mere repetitions, but steps in a progressive development from timid hinting to fully conscious, undistorted perspicuity.

What remains are just such confirmations on Hans's part of analytical conclusions which our interpretations had already established. In an entirely unequivocal symptomatic act, which he disguised slightly from the maid but not at all from his father, he showed how he imagined a birth took place; but if we look into it more closely we can see that he showed something else, that he was hinting at something which was not alluded to again in the analysis. He pushed a small penknife which belonged to his mother in through a round hole in the body of an india-rubber doll, and then let it drop out again by tearing apart the doll's legs. The enlightenment which he received from his parents soon afterwards, to the effect that children do in fact grow inside their mother's body and are pushed out of it like a lump, came too late; it could tell him nothing new. Another symptomatic act, happening as though by accident, involved a confession that he had wished his father dead; for, just at the moment his father was talking of this death-wish, Hans let a horse that he was playing with fall down - knocked it over in fact. Further, he confirmed in so many words the hypothesis that heavily loaded carts represented his mother's pregnancy to him, and the horse's falling down was like having a baby. The most delightful piece of confirmation in this connection - a proof that, in his view, children were 'lumps' - was his inventing the name of 'Lodi' for his favourite child. There was some delay in reporting this fact, for it then appeared that he had been playing with this sausage child of his for a long time past.¹

¹ I remember a set of drawings by T. T. Heine in a copy of *Simplicissimus*, in which that brilliant illustrator depicted the fate of the pork-butcher's child, who fell into the sausage machine, and then, in the shape of a small sausage, was mourned over by his parents, received the Church's blessing, and flew up to Heaven. The artist's idea seems a puzzling one at first, but the Lodi episode in this analysis enables us to trace it back to its infantile root.

We have already considered Hans's two concluding phantasies, with which his recovery was rounded off. One of them, that of the plumber giving him a new and, as his father guessed, a bigger widdler, was not merely a repetition of the earlier phantasy concerning the plumber and the bath. The new one was a triumphant, wishful phantasy, and with it he overcame his fear of castration. His other phantasy, which confessed to the wish to be married to his mother and to have many children by her, did not merely exhaust the content of the unconscious complexes which had been stirred up by the sight of the falling horse and which had generated his anxiety. It also corrected that portion of those thoughts which was entirely unacceptable; for, instead of killing his father, it made him innocuous by promoting him to a marriage with Hans's grandmother. With this phantasy both the illness and the analysis came to an appropriate end.

While the analysis of a case is in progress it is impossible to obtain any clear impression of the structure and development of the neurosis. That is the business of a synthetic process which must be performed subsequently. In attempting to carry out such a synthesis of little Hans's phobia we shall take as our basis the account of his mental constitution, of his governing sexual wishes, and of his experiences up to the time of his sister's birth, which we have given in an earlier part of this paper.

The arrival of his sister brought into Hans's life many new elements, which from that time on gave him no rest. In the first place he was obliged to submit to a certain degree of privation: to begin with, a temporary separation from his mother, and later a permanent diminution in the amount of care and attention which he had received from her and which thenceforward he had to grow accustomed to sharing with his sister. In the second place, he experienced a revival of the pleasures he had enjoyed when he was looked after as an infant; for they were called up by all that he saw his mother doing for the baby. As a result of these two influences his erotic needs became intensified, while at the same time they began to obtain insufficient satisfaction. He made up for the loss which his sister's arrival had entailed on him by imagining that he had children of his own; and so long as he was at Gmunden - on his second visit there - and could really play with these children, he found a sufficient outlet for his affections. But after his return to Vienna he was once more alone, and set all his hopes upon his mother. He had meanwhile suffered another privation, having been exiled from his parents' bedroom at the age of four and a half. His intensified erotic excitability now found expression in phantasies, by which in his loneliness he conjured up his playmates of the past summer, and in regular auto-erotic satisfaction obtained by a masturbatory stimulation of his genitals.

But in the third place his sister's birth stimulated him to an effort of thought which, on the one hand, it was impossible to bring to a conclusion, and which, on the other hand, involved him in emotional conflicts. He was faced with the great riddle of where babies come from, which is perhaps the first problem to engage a child's mental powers, and of which the riddle of the Theban Sphinx is probably no more than a distorted version. He rejected the proffered solution of the stork having brought Hanna. For he had noticed that months before the baby's birth his mother's body had grown big, that then she had gone to bed, and had groaned while the birth was taking place, and that when she got up she was thin again. He therefore inferred that Hanna had been inside his mother's body, and had then come out like a 'lumpf'. He was able to imagine the act of giving birth as a pleasurable one by relating it to his own first feelings of pleasure in passing stool; and he was thus able to find a double motive for wishing to have children of his own: the pleasure of giving birth to them and the pleasure (the compensatory pleasure, as it were) of looking after them. There was nothing in all of this that could have led him into doubts or conflicts.

But there was something else, which could not fail to make him uneasy. His father must have had something to do with little Hanna's birth, for he had declared that Hanna and Hans himself were his children. Yet it was certainly not his father who had brought them into the world, but his mother. This father of his came between him and his mother. When he was there Hans could not sleep with his mother, and when his mother wanted to take Hans into bed with her, his father used to call out. Hans had learnt from experience how well-off he could be in his father's absence, and it was only justifiable that he should wish to get rid of him. And then Hans's hostility had received a fresh reinforcement. His father had told him the lie about the stork and so made it impossible for him to ask for enlightenment upon these things. He not only prevented his being in bed with his mother, but also kept from him the knowledge he was thirsting for. He was putting Hans at a disadvantage in both directions, and was obviously doing so for his own benefit.

But this father, whom he could not help hating as a rival, was the same father whom he had always loved and was bound to go on loving, who had been his model, had been his first playmate, and had looked after him from his earliest infancy: and this it was that gave rise to the first conflict. Nor could this conflict find an immediate solution. For Hans's nature had so developed that for the moment his love could not but keep the upper hand and suppress his hate - though it could not kill it, for his hate was perpetually kept alive by his love for his mother.

But his father not only knew where children came from, he actually performed it - the thing that Hans could only obscurely divine. The widdler must have something to do with it, for his own grew excited whenever he thought of these things - and it must be a big widdler too, bigger than Hans's own. If he listened to these premonitory sensations he could only suppose that it was a question of some act of violence performed upon his mother, of smashing something, of making an opening into something, of forcing a way into an enclosed space - such were the impulses that he felt stirring within him. But although the sensations of his penis had put him on the road to postulating a vagina, yet he could not solve the problem, for within his experience no such thing existed as his widdler required. On the contrary, his conviction that his mother possessed a penis just as he did stood in the way of any solution. His attempt at discovering what it was that had to be done with his mother in order that she might have children sank down into his unconscious; and his two active impulses - the hostile one towards his father and the sadistic-tender one towards his mother - could be put to no use, the first because of the love that existed side by side with the hatred, and the second because of the perplexity in which his infantile sexual theories left him.

This is how, basing my conclusions upon the findings of the analysis, I am obliged to reconstruct the unconscious complexes and wishes, the repression and reawakening of which produced little Hans's phobia. I am aware that in so doing I am attributing a great deal to the mental capacity of a child between four and five years of age; but I have let myself be guided by what we have recently learned, and I do not consider myself bound by the prejudices of our ignorance. It might perhaps have been possible to make use of Hans's fear of the 'making a row with the legs' for filling up a few more gaps in our adjudication upon the evidence. Hans, it is true, declared that it reminded him of his kicking about with his legs when he was compelled to leave off playing so as to do lumf; so that this element of the neurosis becomes connected with the problem whether his mother liked having children or was compelled to have them. But I have an impression that this is not the whole explanation of the 'making a row with the legs'. Hans's father was unable to confirm my suspicion that there was some recollection stirring in the child's mind of having observed a scene of sexual intercourse between his parents in their bedroom. So let us be content with what we have discovered.

It is hard to say what the influence was which, in the situation we have just sketched, led to the sudden change in Hans and to the transformation of his libidinal longing into anxiety - to say from what direction it was that repression set in. The question could probably only be decided by making a comparison between this analysis and a number of similar ones. Whether the scales were turned by the child's *intellectual* inability to solve the difficult problem of the begetting of children and to cope with the aggressive impulses that were liberated by his approaching its solution, or whether the effect was produced by a *somatic* incapacity, a constitutional intolerance of the masturbatory gratification in which he regularly indulged (whether, that is, the mere persistence of sexual excitement at such a high pitch of intensity was bound to bring about a revulsion) - this question must be left open until fresh experience can come to our assistance.

Chronological considerations make it impossible for us to attach any great importance to the actual precipitating cause of the outbreak of Hans's illness, for he had shown signs of apprehensiveness long before he saw the bus-horse fall down in the street.

Nevertheless, the neurosis took its start directly from this chance event and preserved a trace of it in the circumstance of the horse being exalted into the object of his anxiety. In itself the impression of the accident which he happened to witness carried no 'traumatic force'; it acquired its great effectiveness only from the fact that horses had formerly been of importance to him as objects of his predilection and interest, from the fact that he associated the event in his mind with an earlier event at Gmunden which had more claim to be regarded as traumatic, namely, with Fritzl's falling down while he was playing at horses, and lastly from the fact that there was an easy path of association from Fritzl to his father. Indeed, even these connections would probably not have been sufficient if it had not been that, thanks to the pliability and ambiguity of associative chains, the same event showed itself capable of stirring the second of the complexes that lurked in Hans's unconscious, the complex of his pregnant mother's confinement. From that moment the way was clear for the return of the repressed; and it returned in such a manner that *the pathogenic material was remodelled and transposed on to the horse-complex, while the accompanying affects were uniformly transformed into anxiety.*

It deserves to be noticed that the ideational content of Hans's phobia as it then stood had to be submitted to one further process of distortion and substitution before his consciousness took cognizance of it. Hans's first formulation of his anxiety was: 'the horse will bite me'; and this was derived from another episode at Gmunden, which was on the one hand related to his hostile wishes towards his father and on the other hand was reminiscent of the warning he had been given against masturbation. Some interfering influence, emanating from his parents perhaps, had made itself felt. I am not certain whether the reports upon Hans were at that time drawn up with sufficient care to enable us to decide whether he expressed his anxiety in this form *before* or not until *after* his mother had taken him to task on the subject of masturbating. I should be inclined to suspect that it was not until afterwards, though this would contradict the account given in the case history. At any rate, it is evident that at every point Hans's hostile complex against his father screened his lustful one about his mother, just as it was the first to be disclosed and dealt with in the analysis.

In other cases of this kind there would be a great deal more to be said upon the structure, the development, and the diffusion of the neurosis. But the history of little Hans's attack was very short; almost as soon as it had begun, its place was taken by the history of its treatment. And although during the treatment the phobia appeared to develop further and to extend over new objects and to lay down new conditions, his father, since he was himself treating the case, naturally had sufficient penetration to see that it was merely a question of the emergence of material that was already in existence, and not of fresh productions for which the treatment might be held responsible. In the treatment of other cases it would not always be possible to count upon so much penetration.

Before I can regard this synthesis as completed I must turn to yet another aspect of the case, which will take us into the very heart of the difficulties that lie in the way of our understanding of neurotic states. We have seen how our little patient was overtaken by a great wave of repression and that it caught precisely those of his sexual components that were dominant.¹ He gave up masturbation, and turned away in disgust from everything that reminded him of excrement and of looking on at other people performing their natural functions. But these were not the components which were stirred up by the precipitating cause of the illness (his seeing the horse fall down) or which provided the material for the symptoms, that is, the content of the phobia.

This allows us, therefore, to make a radical distinction. We shall probably come to understand the case more deeply if we turn to those other components which *do* fulfil the two conditions that have just been mentioned. These other components were tendencies in Hans which had already been suppressed and which, so far as we can tell, had never been able to find uninhibited expression: hostile and jealous feelings towards his father, and sadistic impulses (premonitions, as it were, of copulation) towards his mother. These early suppressions may perhaps have gone to form the predisposition for his subsequent illness. These aggressive propensities of Hans's found no outlet, and as soon as there came a time of privation and of intensified sexual excitement, they tried to break their way out with reinforced strength. It was then that the battle which we call his 'phobia' burst out. During the course of it a part of the repressed ideas, in a distorted form and transposed on to another complex, forced their way into consciousness as the content of the phobia. But it was a decidedly paltry success. Victory lay with the forces of repression; and *they made use of the opportunity to extend their domain over components other than those that had rebelled*. This last circumstance, however, does not in the least alter the fact that the essence of Hans's illness was entirely dependent upon the nature of the instinctual components that had to be repulsed. The content of his phobia was such as to impose a very great measure of restriction upon his freedom of movement, and that was its purpose. It was therefore a powerful reaction against the obscure impulses to movement which were especially directed against his mother. For Hans horses had always typified pleasure in movement ('I'm a young horse', he had said as he jumped about); but since this pleasure in movement included the impulse to copulate, the neurosis imposed a restriction on it and exalted the horse into an emblem of terror. Thus it would seem as though all that the repressed instincts got from the neurosis was the honour of providing pretexts for the appearance of the anxiety in consciousness. But however clear may have been the victory in Hans's phobia of the forces that were opposed to sexuality, nevertheless, since such an illness is in its very nature a compromise, this cannot have been all that the repressed instincts obtained. After all, Hans's phobia of horses was an obstacle to his going into the street, and could serve as a means of allowing him to stay at home with his beloved mother. In this way, therefore, his affection for his mother triumphantly achieved its aim. In consequence of his phobia, the lover clung to the object of his love - though, to be sure, steps had been taken to make him innocuous. The true character of a neurotic disorder is exhibited in this twofold result.

¹ Hans's father even observed that simultaneously with this repression a certain amount of sublimation set in. From the time of the beginning of his anxiety Hans began to show an increased interest in music and to develop his inherited musical gift.

Alfred Adler, in a suggestive paper,¹ has recently developed the view that anxiety arises from the suppression of what he calls the 'aggressive instinct', and by a very sweeping synthetic process he ascribes to that instinct the chief part in human events, 'in real life and in the neuroses'. As we have come to the conclusion that in our present case of phobia the anxiety is to be explained as being due to the repression of Hans's aggressive propensities (the hostile ones against his father and the sadistic ones against his mother), we seem to have produced a most striking piece of confirmation of Adler's view. I am nevertheless unable to assent to it, and indeed I regard it as a misleading generalization. I cannot bring myself to assume the existence of a special aggressive instinct alongside of the familiar instincts of self-preservation and of sex, and on an equal footing with them.² It appears to me that Adler has mistakenly promoted into a special and self-subsisting instinct what is in reality a universal and indispensable attribute of *all* instincts - their instinctual [*triebhaft*] and 'pressing' character, what might be described as their capacity for initiating movement. Nothing would then remain of the other instincts but their relation to an aim, for their relation to the means of reaching that aim would have been taken over from them by the 'aggressive instinct'. In spite of all the uncertainty and obscurity of our theory of instincts I should prefer for the present to adhere to the usual view, which leaves each instinct its own power of becoming aggressive; and I should be inclined to recognize the two instincts which became repressed in Hans as familiar components of the sexual libido.

¹ 'Der Aggressionsbetrieb im Leben und in der Neurose' (1908). This is the same paper from which I have borrowed the term 'confluence of instincts'. (See above, [p. 2091](#))

² [Footnote added 1923:] The above passage was written at a time when Adler seemed still to be taking his stand upon the ground of psycho-analysis, and before he had put forward the masculine protest and disavowed repression. Since then I have myself been obliged to assert the existence of an 'aggressive instinct', but it is different from Adler's. I prefer to call it the 'destructive' or 'death instinct'. See *Beyond the Pleasure Principle* (1920g) and *The Ego and the Id* (1923b). Its opposition to the libidinal instincts finds an expression in the familiar polarity of love and hate. My disagreement with Adler's view, which results in a universal characteristic of instincts in general being reduced to be the property of a single one of them, remains unaltered.

(III)

I shall now proceed to what I hope will be a brief discussion of how far little Hans's phobia offers any contribution of general importance to our views upon the life and upbringing of children. But before doing so I must return to the objection which has so long been held over, and according to which Hans was a neurotic, a 'degenerate' with a bad heredity, and not a normal child, knowledge about whom could be applied to other children. I have for some time been thinking with pain of the way in which the adherents of 'the normal person' will fall upon poor little Hans as soon as they are told that he can in fact be shown to have had a hereditary taint. His beautiful mother fell ill with a neurosis as a result of a conflict during her girlhood. I was able to be of assistance to her at the time, and this had in fact been the beginning of my connection with Hans's parents. It is only with the greatest diffidence that I venture to bring forward one or two considerations in his favour.

In the first place Hans was not what one would understand, strictly speaking, by a degenerate child, condemned by his heredity to be a neurotic. On the contrary, he was well formed physically, and was a cheerful, amiable, active-minded young fellow who might give pleasure to more people than his own father. There can be no question, of course, as to his sexual precocity; but on that point there is very little material upon which a fair comparison can be based. I gather, for instance, from a piece of collective research conducted in America, that it is by no means such a rare thing to find object-choice and feelings of love in boys at a similarly early age; and the same may be learnt from studying the records of the childhood of men who have later come to be recognized as 'great'. I should therefore be inclined to believe that sexual precocity is a correlate, which is seldom absent, of intellectual precocity, and that it is therefore to be met with in gifted children more often than might be expected.

Furthermore, let me say in Hans's favour (and I frankly admit my partisan attitude) that he is not the only child who has been overtaken by a phobia at some time or other in his childhood. Troubles of that kind are well known to be quite extraordinarily frequent, even in children the strictness of whose upbringing has left nothing to be desired. In later life these children either become neurotic or remain healthy. Their phobias are shouted down in the nursery because they are inaccessible to treatment and are decidedly inconvenient. In the course of months or years they diminish, and the child seems to recover; but no one can tell what psychological changes are necessitated by such a recovery, or what alterations in character are involved in it. When, however, an adult neurotic patient comes to us for psycho-analytic treatment (and let us assume that his illness has only become manifest after he has reached maturity), we find regularly that his neurosis has as its point of departure an infantile anxiety such as we have been discussing, and is in fact a continuation of it; so that, as it were, a continuous and undisturbed thread of psychical activity, taking its start from the conflicts of his childhood, has been spun through his life - irrespective of whether the first symptom of those conflicts has persisted or has retreated under the pressure of circumstances. I think, therefore, that Hans's illness may perhaps have been no more serious than that of many other children who are not branded as 'degenerates'; but since he was brought up without being intimidated, and with as much consideration and as little coercion as possible, his anxiety dared to show itself more boldly. With him there was no place for such motives as a bad conscience or a fear of punishment, which with other children must no doubt contribute to making the anxiety less. It seems to me that we concentrate too much upon symptoms and concern ourselves too little with their causes. In bringing up children we aim only at being left in peace and having no difficulties, in short, at training up a model child, and we pay very little attention to whether such a course of development is for the child's good as well. I can therefore quite imagine that it may have been to Hans's advantage to have produced this phobia. For it directed his parents' attention to the unavoidable difficulties by which a child is confronted when in the course of his cultural training he is called upon to overcome the innate instinctual components of his mind; and his trouble brought his father to his assistance. It may be that Hans now enjoys an advantage over other children, in that he no longer carries within him that seed in the shape of repressed complexes which must always be of some significance for a child's later life, and which undoubtedly brings with it a certain degree of deformity of character if not a predisposition to a subsequent neurosis. I am inclined to think that this is so, but I do not know if many others will share my opinion; nor do I know whether experience will prove me right.

But I must now enquire what harm was done to Hans by dragging to light in him complexes such as are not only repressed by children but dreaded by their parents. Did the little boy proceed to take some serious action as regards what he wanted from his mother? or did his evil intentions against his father give place to evil deeds? Such misgivings will no doubt have occurred to many doctors, who misunderstand the nature of psycho-analysis and think that wicked instincts are strengthened by being made conscious. Wise men like these are being no more than consistent when they implore us for heaven's sake not to meddle with the evil things that lurk behind a neurosis. In so doing they forget, it is true, that they are physicians, and their words bear a fatal resemblance to Dogberry's, when he advised the Watch to avoid all contact with any thieves they might happen to meet: 'for such kind of men, the less you meddle or make with them, why, the more is for your honesty.'¹

On the contrary, the only results of the analysis were that Hans recovered, that he ceased to be afraid of horses, and that he got on to rather familiar terms with his father, as the latter reported with some amusement. But whatever his father may have lost in the boy's respect he won back in his confidence: 'I thought', said Hans, 'you knew everything, as you knew that about the horse.' For analysis does not undo the *effects* of repression. The instincts which were formerly suppressed remain suppressed; but the same effect is produced in a different way. Analysis replaces the process of repression, which is an automatic and excessive one, by a temperate and purposeful control on the part of the highest agencies of the mind. In a word, *analysis replaces repression by condemnation*. This seems to bring us the long-looked-for evidence that consciousness has a biological function, and that with its entrance upon the scene an important advantage is secured.²

¹ At this point I cannot keep back an astonished question. Where do my opponents obtain their knowledge, which they produce with so much confidence, on the question whether the repressed sexual instincts play a part, and if so what part, in the aetiology of the neuroses, if they shut their patients' mouths as soon as they begin to talk about their complexes or their derivatives? For the only alternative source of knowledge remaining open to them are my own writings and those of my adherents.

² [Footnote added 1923:] I am here using the word 'consciousness' in a sense which I later avoided, namely, to describe our normal processes of thought - such, that is, as are capable of consciousness. We know that thought processes of this kind may also take place *preconsciously*; and it is wiser to regard their actual 'consciousness' from a purely phenomenological standpoint. By this I do not, of course, mean to contradict the expectation that consciousness in this more limited sense of the word must also fulfil some biological function.

If matters had lain entirely in my hands, I should have ventured to give the child the one remaining piece of enlightenment which his parents withheld from him. I should have confirmed his instinctive premonitions, by telling him of the existence of the vagina and of copulation; thus I should have still further diminished his unsolved residue, and put an end to his stream of questions. I am convinced that this new piece of enlightenment would have made him lose neither his love for his mother nor his own childish nature, and that he would have understood that his preoccupation with these important, these momentous things must rest for the present - until his wish to be big had been fulfilled. But the educational experiment was not carried so far.

That no sharp line can be drawn between 'neurotic' and 'normal' people - whether children or adults - that our conception of 'disease' is a purely practical one and a question of summation, that predisposition and the eventualities of life must combine before the threshold of this summation is overstepped, and that consequently a number of individuals are constantly passing from the class of healthy people into that of neurotic patients, while a far smaller number also make the journey in the opposite direction, - all of these are things which have been said so often and have met with so much agreement that I am certainly not alone in maintaining their truth. It is, to say the least of it, extremely probable that a child's upbringing can exercise a powerful influence for good or for evil upon the predisposition which we have just mentioned as one of the factors in the occurrence of 'disease'; but what that upbringing is to aim at and at what point it is to be brought to bear seem at present to be very doubtful questions. Hitherto education has only set itself the task of controlling, or, it would often be more proper to say, of suppressing, the instincts. The results have been by no means gratifying, and where the process has succeeded it has only been to the advantage of a small number of favoured individuals who have not been required to suppress their instincts. Nor has any one enquired by what means and at what cost the suppression of the inconvenient instincts has been achieved. Supposing now that we substitute another task for this one, and aim instead at making the individual capable of becoming a civilized and useful member of society with the least possible sacrifice of his own activity; in that case the information gained by psycho-analysis, upon the origin of pathogenic complexes and upon the nucleus of every nervous affection, can claim with justice that it deserves to be regarded by educators as an invaluable guide in their conduct towards children. What practical conclusions may follow from this, and how far experience may justify the application of those conclusions within our present social system, are matters which I leave to the examination and decision of others.

I cannot take leave of our small patient's phobia without giving expression to a notion which has made its analysis, leading as it did to a recovery, seem of especial value to me. Strictly speaking, I learnt nothing new from this analysis, nothing that I had not already been able to discover (though often less distinctly and more indirectly) from other patients analysed at a more advanced age. But the neuroses of these other patients could in every instance be traced back to the same infantile complexes that were revealed behind Hans's phobia. I am therefore tempted to claim for this neurosis of childhood the significance of being a type and a model, and to suppose that the multiplicity of the phenomena of repression exhibited by neuroses and the abundance of their pathogenic material do not prevent their being derived from a very limited number of processes concerned with identical ideational complexes.

POSTSCRIPT (1922)

A few months ago - in the spring of 1922 - a young man introduced himself to me and informed me that he was the 'little Hans' whose infantile neurosis had been the subject of the paper which I published in 1909. I was very glad to see him again, for about two years after the end of his analysis I had lost sight of him and had heard nothing of him for more than ten years. The publication of this first analysis of a child had caused a great stir and even greater indignation, and a most evil future had been foretold for the poor little boy, because he had been 'robbed of his innocence' at such a tender age and had been made the victim of a psycho-analysis.

But none of these apprehensions had come true. Little Hans was now a strapping youth of nineteen. He declared that he was perfectly well, and suffered from no troubles or inhibitions. Not only had he come through his puberty without any damage, but his emotional life had successfully undergone one of the severest of ordeals. His parents had been divorced and each of them had married again. In consequence of this he lived by himself; but he was on good terms with both of his parents, and only regretted that as a result of the breaking-up of the family he had been separated from the younger sister he was so fond of.

One piece of information given me by little Hans struck me as particularly remarkable; nor do I venture to give any explanation of it. When he read his case history, he told me, the whole of it came to him as something unknown; he did not recognize himself; he could remember nothing; and it was only when he came upon the journey to Gmunden that there dawned on him a kind of glimmering recollection that it might have been he himself that it happened to. So the analysis had not preserved the events from amnesia, but had been overtaken by amnesia itself. Any one who is familiar with psycho-analysis may occasionally experience something similar in sleep. He will be woken up by a dream, and will decide to analyse it then and there; he will then go to sleep again feeling quite satisfied with the result of his efforts; and next morning dream and analysis will alike be forgotten.

NOTES UPON A CASE OF OBSESSIONAL NEUROSIS
(1909)

Intentionally left blank

NOTES UPON A CASE OF OBSESSIONAL NEUROSIS

The matter contained in the following pages will be of two kinds. In the first place I shall give some fragmentary extracts from the history of a case of obsessional neurosis. This case judged by its length, the injuriousness of its effects, and the patient's own view of it, deserves to be classed as a moderately severe one; the treatment, which lasted for about a year, led to the complete restoration of the patient's personality, and to the removal of his inhibitions. In the second place, starting out from this case, and also taking other cases into account which I have previously analysed, I shall make some disconnected statements of an aphoristic character upon the genesis and finer psychological mechanism of obsessional processes, and I shall thus hope to develop my first observations on the subject, published in 1896.¹

A programme of this kind seems to me to require some justification. For it might otherwise be thought that I regard this method of making a communication as perfectly correct and as one to be imitated; whereas in reality I am only accommodating myself to obstacles, some external and others inherent in the subject, and I should gladly have communicated more if it had been right or possible for me to do so. I cannot give a complete history of the treatment, because that would involve my entering in detail into the circumstances of my patient's life. The importunate interest of a capital city, focused with particular attention upon my medical activities, forbids my giving a faithful picture of the case. On the other hand I have come more and more to regard the distortions usually resorted to in such circumstances as useless and objectionable. If the distortions are slight, they fail in their object of protecting the patient from indiscreet curiosity; while if they go beyond this they require too great a sacrifice, for they destroy the intelligibility of the material, which depends for its coherence precisely upon the small details of real life. And from this latter circumstance follows the paradoxical truth that it is far easier to divulge the patient's most intimate secrets than the most innocent and trivial facts about him; for, whereas the former would not throw any light on his identity, the latter, by which he is generally recognized, would make it obvious to every one.

¹ 'Further Remarks on the Neuro-Psychoses of Defence', 1896*b* (Section II. 'The Nature and Mechanism of Obsessional Neurosis').

Such is my excuse for having curtailed so drastically the history of this case and its treatment. And I can offer still more cogent reasons for having confined myself to the statement only of some disconnected results of the psycho-analytic investigation of obsessional neuroses. I must confess that I have not yet succeeded in completely penetrating the complicated texture of a *severe* case of obsessional neurosis, and that, if I were to reproduce the analysis, it would be impossible for me to make the structure, such as by the help of analysis we know or suspect it to be, visible to others through the mass of therapeutic work superimposed upon it. What add so greatly to the difficulty of doing this are the resistances of the patients and the forms in which they are expressed. But even apart from this it must be admitted that an obsessional neurosis is in itself not an easy thing to understand - much less so than a case of hysteria. Actually, indeed, we should have expected to find the contrary. The language of an obsessional neurosis - the means by which it expresses its secret thoughts - is, as it were, only a dialect of the language of hysteria; but it is a dialect in which we ought to be able to find our way about more easily, since it is more nearly related to the forms of expression adopted by our conscious thought than is the language of hysteria. Above all, it does not involve the leap from a mental process to a somatic innervation - hysterical conversion - which can never be fully comprehensible to us.

Perhaps it is only because we are less familiar with obsessional neuroses that we do not find these expectations confirmed by the facts. Persons suffering from a severe degree of obsessional neurosis present themselves far less frequently for analytic treatment than hysterical patients. They dissimulate their condition in daily life, too, as long as they possibly can, and often call in a physician only when their complaint has reached such an advanced stage as, had they been suffering, for instance, from tuberculosis of the lungs, would have led to their being refused admission to a sanatorium. I make this comparison, moreover, because, as with the chronic infectious disease which I have just mentioned, we can point to a number of brilliant therapeutic successes in severe no less than in light cases of obsessional neurosis, where these have been taken in hand at an early stage.

In these circumstances there is no alternative but to report the facts in the imperfect and incomplete fashion in which they are known and in which it is legitimate to communicate them. The crumbs of knowledge offered in these pages, though they have been laboriously enough collected, may not in themselves prove very satisfying; but they may serve as a starting-point for the work of other investigators, and common endeavour may bring the success which is perhaps beyond the reach of individual effort.

I

EXTRACTS FROM THE CASE HISTORY

A youngish man of university education introduced himself to me with the statement that he had suffered from obsessions ever since his childhood, but with particular intensity for the last four years. The chief features of his disorder were *fears* that something might happen to two people of whom he was very fond - his father and a lady whom he admired. Besides this he was aware of *compulsive impulses* - such as an impulse, for instance, to cut his throat with a razor; and further he produced *prohibitions*, sometimes in connection with quite unimportant things. He had wasted years, he told me, in fighting against these ideas of his, and in this way had lost much ground in the course of his life. He had tried various treatments, but none had been of any use to him except a course of hydrotherapy at a sanatorium near ---; and this, he thought, had probably only been because he had made an acquaintance there which had led to regular sexual intercourse. Here he had no opportunities of the sort, and he seldom had intercourse and only at irregular intervals. He felt disgust at prostitutes. Altogether, he said, his sexual life had been stunted; masturbation had played only a small part in it, in his sixteenth or seventeenth year. His potency was normal; he had first had intercourse at the age of twenty-six.

He gave me the impression of being a clear-headed and shrewd person. When I asked him what it was that made him lay such stress upon telling me about his sexual life, he replied that that was what he knew about my theories. Actually, however, he had read none of my writings, except that a short time before he had been turning over the pages of one of my books¹ and had come across the explanation of some curious verbal associations which had so much reminded him of some of his own 'efforts of thought' in connection with his ideas that he had decided to put himself in my hands.

¹ *The Psychopathology of Everyday Life.*

(A) THE BEGINNING OF THE TREATMENT

The next day I made him pledge himself to submit to the one and only condition of the treatment - namely, to say everything that came into his head, even if it was *unpleasant* to him, or seemed *unimportant* or *irrelevant* or *senseless*. I then gave him leave to start his communications with any subject he pleased, and he began thus:¹

He had a friend, he told me, of whom he had an extraordinarily high opinion. He used always to go to him when he was tormented by some criminal impulse, and ask him whether he despised him as a criminal. His friend used then to give him moral support by assuring him that he was a man of irreproachable conduct, and had probably been in the habit, from his youth onwards, of taking a dark view of his own life. At an earlier date, he went on, another person had exercised a similar influence over him. This was a nineteen-year-old student (he himself had been fourteen or fifteen at the time) who had taken a liking to him, and had raised his self-esteem to an extraordinary degree, so that he appeared to himself to be a genius. This student had subsequently become his tutor, and had suddenly altered his behaviour and begun treating him as though he were an idiot. At length he had noticed that the student was interested in one of his sisters, and had realized that he had only taken him up in order to gain admission into the house. This had been the first great blow of his life.

He then proceeded without any apparent transition:-

¹ What follows is based upon notes made on the evening of the day of treatment, and adheres as closely as possible to my recollection of the patient's words. - I feel obliged to offer a warning against the practice of noting down what the patient says during the actual time of treatment. The consequent withdrawal of the physician's attention does the patient more harm than can be made up for by any increase in accuracy that may be achieved in the reproduction of his case history.

(B) INFANTILE SEXUALITY

'My sexual life began very early. I can remember a scene during my fourth or fifth year. (From my sixth year onwards I can remember everything.) This scene came into my head quite distinctly, years later. We had a very pretty young governess called Fräulein Peter.¹ One evening she was lying on the sofa lightly dressed, and reading. I was lying beside her, and begged her to let me creep under her skirt. She told me I might, so long as I said nothing to any one about it. She had very little on, and I fingered her genitals and the lower part of her body, which struck me as very queer. After this I was left with a burning and tormenting curiosity to see the female body. I can still remember the intense excitement with which I waited at the Baths (which I was still allowed to go to with the governess and my sisters) for the governess to undress and get into the water. I can remember more things from my sixth year onwards. At that time we had another governess, who was also young and good-looking. She had abscesses on her buttocks which she was in the habit of pressing out at night. I used to wait eagerly for that moment, to appease my curiosity. It was just the same at the Baths - though Fräulein Lina was more reserved than her predecessor.' (In reply to a question which I threw in, 'As a rule,' the patient told me, 'I did not sleep in her room, but mostly with my parents.')

'I remember a scene which must have taken place when I was seven years old.² We were sitting together one evening - the governess, the cook, another servant-girl, myself and my brother, who was eighteen months younger than me. The young women were talking, and I suddenly became aware of Fräulein Lina saying: "It could be done with the little one; but Paul" (that was I) "is too clumsy, he would be sure to miss it." I did not understand clearly what was meant, but I felt the slight and began to cry. Lina comforted me, and told me how a girl, who had done something of the kind with a little boy she was in charge of, had been put in prison for several months. I do not believe she actually did anything wrong with me, but I took a great many liberties with her. When I got into her bed I used to uncover her and touch her, and she made no objections. She was not very intelligent, and clearly had very strong sexual cravings. At twenty-three she had already had a child. She afterwards married its father, so that to-day she is a Frau Hofrat. Even now I often see her in the street.

¹ Dr. Alfred Adler, who was formerly an analyst, once drew attention in a privately delivered paper to the peculiar importance which attaches to the *very first* communications made by patients. Here is an instance of this. The patient's opening words laid stress upon the influence exercised over him by men, that is to say, upon the part played in his life by homosexual object-choice; but immediately afterwards they touched upon a second *motif*, which was to become of great importance later on, namely, the conflict between man and woman and the opposition of their interests. Even the fact that he remembered his first pretty governess by her surname, which happened to be a man's first name, must be taken into account in this connection. In middle-class circles in Vienna it is more usual to call a governess by her first name, and it is by that name that she is more commonly remembered.

² The patient subsequently admitted that this scene probably occurred one or two years later.

‘When I was six years old I already suffered from erections, and I know that once I went to my mother to complain about them. I know too that in doing so I had some misgivings to get over, for I had a feeling that there was some connection between this subject and my ideas and inquisitiveness, and at that time I used to have a morbid idea *that my parents knew my thoughts; I explained this to myself by supposing that I had spoken them out loud, without having heard myself do it.* I look on this as the beginning of my illness. There were certain people, girls, who pleased me very much, and I had a very strong wish *to see them naked.* But in wishing this I had *an uncanny feeling, as though something must happen if I thought such things, and as though I must do all sorts of things to prevent it.*’

(In reply to a question he gave an example of these fears: ‘For instance, *that my father might die.*’) ‘Thoughts about my father’s death occupied my mind from a very early age and for a long period of time, and greatly depressed me.’

At this point I learnt with astonishment that the patient’s father, with whom his obsessional fears were, after all, occupied *now*, had died several years previously.

The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect.¹ A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the *protective measures* which the patient adopted.

¹ Yet attempts have been made to explain obsessions without taking the affects into account!

We find, accordingly: an erotic instinct and a revolt against it; a wish which has not yet become compulsive and, struggling against it, a fear which is already compulsive; a distressing affect and an impulsion towards the performance of defensive acts. The inventory of the neurosis has reached its full muster. Indeed, something more is present, namely, a kind of *delusion* or *delirium* with the strange content that his parents knew his thoughts because he spoke them out loud without his hearing himself do it. We shall not go far astray if we suppose that in making this attempt at an explanation the child had some inkling of those remarkable mental processes which we describe as unconscious and which we cannot dispense with if we are to throw any scientific light upon this obscure subject. 'I speak my thoughts out loud, without hearing them' sounds like a projection into the external world of our own hypothesis that he had thoughts without knowing anything about them; it sounds like an endopsychic perception of what has been repressed.

For the situation is clear. This elementary neurosis of childhood already involved a problem and an apparent absurdity, like any complicated neurosis of maturity. What can have been the meaning of the child's idea that if he had this lascivious wish his father would be bound to die? Was it sheer nonsense? Or are there means of understanding the words and of perceiving them as a necessary consequence of earlier events and premises?

If we apply knowledge gained elsewhere to this case of childhood neurosis, we shall not be able to avoid a suspicion that in this instance as in others (that is to say, before the child had reached his sixth year) there had been conflicts and repressions, which had themselves been overtaken by amnesia, but had left behind them as a residuum the particular content of this obsessive fear. Later on we shall learn how far it is possible for us to rediscover those forgotten experiences or to reconstruct them with some degree of certainty. In the meantime stress may be laid on the fact, which is probably more than a mere coincidence, that the patient's infantile amnesia ended precisely with his sixth year.

To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysterias that the factors which go to form a psychoneurosis are to be found in the patient's *infantile* sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.

(C) THE GREAT OBSESSIVE FEAR

'I think I will begin to-day with the experience which was the immediate occasion of my coming to you. It was in August, during the manoeuvres in ---. I had been suffering before, and tormenting myself with all kinds of obsessional thoughts, but they had quickly passed off during the manoeuvres. I was keen to show the regular officers that people like me had not only learnt a good deal but could stand a good deal too. One day we started from --- on a short march. During a halt I lost my pince-nez, and, although I could easily have found them, I did not want to delay our start, so I gave them up. But I wired to my opticians in Vienna to send me another pair by the next post. During that same halt I sat between two officers, one of whom, a captain with a Czech name, was to be of no small importance to me. I had a kind of dread of him, *for he was obviously fond of cruelty*. I do not say he was a bad man, but at the officers' mess he had repeatedly defended the introduction of corporal punishment, so that I had been obliged to disagree with him very sharply. Well, during this halt we got into conversation, and the captain told me he had read of a specially horrible punishment used in the East . . .'

Here the patient broke off, got up from the sofa, and begged me to spare him the recital of the details. I assured him that I myself had no taste whatever for cruelty, and certainly had no desire to torment him, but that naturally I could not grant him something which was beyond my power. He might just as well ask me to give him the moon. The overcoming of resistances was a law of the treatment, and on no consideration could it be dispensed with. (I had explained the idea of 'resistance' to him at the beginning of the hour, when he told me there was much in himself which he would have to overcome if he was to relate this experience of his.) I went on to say that I would do all I could, nevertheless, to guess the full meaning of any hints he gave me. Was he perhaps thinking of impalement? - 'No, not that; . . . the criminal was tied up . . .' - he expressed himself so indistinctly that I could not immediately guess in what position - 'a pot was turned upside down on his buttocks . . . some *rats* were put into it . . . and they . . .' - he had again got up, and was showing every sign of horror and resistance - '*. . . bored their way in . . .*' - Into his anus, I helped him out.

At all the more important moments while he was telling his story his face took on a very strange, composite expression. I could only interpret it as one of *horror at pleasure of his own of which he himself was unaware*. He proceeded with the greatest difficulty: 'At that moment the idea flashed through my mind *that this was happening to a person who was very dear to me.*'¹ In answer to a direct question he said that it was not he himself who was carrying out the punishment, but that it was being carried out as it were impersonally. After a little prompting I learnt that the person to whom this 'idea' of his related was the lady whom he admired.

¹ He said 'idea' - the stronger and more significant term 'wish', or rather 'fear', having evidently been censored. Unfortunately I am not able to reproduce the peculiar indeterminateness of all his remarks.

He broke off his story in order to assure me that these thoughts were entirely foreign and repugnant to him, and to tell me that everything which had followed in their train had passed through his mind with the most extraordinary rapidity. Simultaneously with the idea there always appeared a 'sanction', that is to say, the defensive measure which he was obliged to adopt in order to prevent the phantasy from being fulfilled. When the captain had spoken of this ghastly punishment, he went on, and these ideas had come into his head, by employing his usual formulas (a 'but' accompanied by a gesture of repudiation, and the phrase 'whatever are you thinking of?') he had just succeeded in warding off *both* of them.

This 'both' took me aback, and it has no doubt also mystified the reader. For so far we have heard only of one idea - of the rat punishment being carried out upon the lady. He was now obliged to admit that a second idea had occurred to him simultaneously, namely, the idea of the punishment being applied to his father. As his father had died many years previously, this obsessive fear was much more nonsensical even than the first, and accordingly it had attempted to escape being confessed to for a little while longer.

That evening, he continued, the same captain had handed him a packet that had arrived by the post and had said: 'Lieutenant A.¹ has paid the charges for you. You must pay him back.' The packet had contained the pince-nez that he had wired for. At that instant, however, a 'sanction' had taken shape in his mind, namely, *that he was not to pay back the money* or it would happen - (that is, the phantasy about the rats would come true as regards his father and the lady). And immediately, in accordance with a type of procedure with which he was familiar, to combat this sanction there had arisen a command in the shape of a vow: '*You must pay back the 3.80 Kronen to Lieutenant A.*' He had said these words to himself almost half aloud.

Two days later the manoeuvres had come to an end. He had spent the whole of the intervening time in efforts at repaying Lieutenant A. the small amount in question; but a succession of difficulties of an apparently *external* nature had arisen to prevent it. First he had tried to effect the payment through another officer who had been going to the post office. But he had been much relieved when this officer brought him back the money, saying that he had not met Lieutenant A. there, for this method of fulfilling his vow had not satisfied him, as it did not correspond with the wording, which ran: '*You must pay back the money to Lieutenant A.*' Finally, he had met Lieutenant A., the person he was looking for; but that officer had refused to accept the money, declaring that he had not paid anything for him, and had nothing whatever to do with the post, which was the business of Lieutenant B. This had thrown my patient into great perplexity, for it meant that he was unable to keep his vow, since it had been based upon false premises. He had excogitated a very curious means of getting out of his difficulty, namely, that he should go to the post office with both the men, A. and B., that A. should give the young lady there the 3.80 *kronen*, that the young lady should give them to B., and that then he himself should pay back the 3.80 *kronen* to A. according to the wording of his vow.

¹ The names are of little consequence here.

It would not surprise me to hear that at this point the reader had ceased to be able to follow. For even the detailed account which the patient gave me of the external events of these days and of his reactions to them was full of self-contradictions and sounded hopelessly confused. It was only when he told the story for the third time that I could get him to realize its obscurities and could lay bare the errors of memory and the displacements in which he had become involved. I shall spare myself the trouble of reproducing these details, the essentials of which we shall easily be able to pick up later on, and I will only add that at the end of this second session the patient behaved as though he were dazed and bewildered. He repeatedly addressed me as 'Captain', probably because at the beginning of the hour I had told him that I myself was not fond of cruelty like Captain N., and that I had no intention of tormenting him unnecessarily.

The only other piece of information that I obtained from him during this hour was that from the very first, on all the previous occasions on which he had had a fear that something would happen to people he loved no less than on the present one, he had referred the punishments not only to our present life but also to eternity - to the next world. Up to his fourteenth or fifteenth year he had been devoutly religious, but from that time on he had gradually developed into the free-thinker that he was to-day. He reconciled the contradiction between his beliefs and his obsessions by saying to himself: 'What do you know about the next world? Nothing *can* be known about it. You're not risking anything - so do it.' This form of argument seemed unobjectionable to a man who was in other respects particularly clear-headed, and in this way he exploited the uncertainty of reason in the face of these questions to the benefit of the religious attitude which he had outgrown.

At the third session he completed his very characteristic story of his efforts at fulfilling his obsessional vow. That evening the last gathering of officers had taken place before the end of the manoeuvres. It had fallen to him to reply to the toast of 'The Gentlemen of the Reserve'. He had spoken well, but as if he were in a dream, for at the back of his mind he was being incessantly tormented by his vow. He had spent a terrible night. Arguments and counter-arguments had struggled with one another. The chief argument, of course, had been that the premise upon which his vow had been based - that Lieutenant A. had paid the money for him - had proved to be false. However, he had consoled himself with the thought that the business was not yet finished, as A. would be riding with him next morning part of the way to the railway station at P--, so that he would still have time to ask him the necessary favour. As a matter of fact he had not done this, and had allowed A. to go off without him; but he had given instructions to his orderly to let A. know that he intended to pay him a visit that afternoon. He himself had reached the station at half-past nine in the morning. He had deposited his luggage there and had seen to various things he had to do in the small town, with the intention of afterwards paying his visit to A. The village in which A. was stationed was about an hour's drive from the town of P--. The railway journey to the place where the post office was would take three hours. He had calculated, therefore, that the execution of his complicated plan would just leave him time to catch the evening train from P--- to Vienna. The ideas that were struggling within him had been, on the one hand, that he was simply being cowardly and was obviously only trying to save himself the unpleasantness of asking A. to make the sacrifice in question and of cutting a foolish figure before him, and that that was why he was disregarding his vow; and, on the other hand, that it would, on the contrary, be cowardly of him to *fulfil* his vow, since he only wanted to do so in order to be left in peace by his obsessions. When in the course of his deliberations, the patient added, he found the arguments so evenly balanced as these, it was his custom to allow his actions to be decided by chance events as though by the hand of God. When, therefore, a porter at the station had addressed him with the words, 'Ten o'clock train, sir?' he had answered 'Yes', and in fact had gone off by the ten o'clock train. In this way he had produced *fait accompli* and felt greatly relieved. He had proceeded to book a seat for luncheon in the restaurant car. At the first station they had stopped at it had suddenly struck him that he still had time to get out, wait for the next down train, travel back in it to P--, drive to the place where Lieutenant A. was quartered, from there make the three hours' train journey with him to the post office, and so forth. It had only been the consideration that he had booked his seat for luncheon with the steward of the restaurant car that had prevented his carrying out this design. He had not abandoned it, however; he had only put off getting out until a later stop. In this way he had struggled through from station to station, till he had reached one at which it had seemed to him impossible to get out because he had relatives living there. He had then determined to travel through to Vienna, to look up his friend there and lay the whole matter before him, and then, after his friend had made his decision, to catch the night train back to P--. When I expressed a doubt whether this would have been feasible, he assured me that he would have had half an hour to spare between the arrival of the one train and the departure of the other. When he had arrived in Vienna, however, he had failed to find his friend at the restaurant at which he had counted on meeting him, and had not reached his friend's house till eleven o'clock at night. He told him the whole story that very night. His friend had held up his hands in amazement to think that he could still be in doubt whether he was suffering from an obsession, and had calmed him down for the night, so that he had slept excellently. Next morning they had gone together to the post office, to dispatch the 3.80 *kronen* to the post office at which the packet containing the pince-nez had arrived.

It was this last statement which provided me with a starting-point from which I could begin straightening out the various distortions involved in his story. After his friend had brought him to his senses he had dispatched the small sum of money in question neither to Lieutenant A. nor to Lieutenant B., but direct to the post office. He must therefore have known that he owed the amount of the charges due upon the packet *to no one but the official at the post office*, and he must have known this before he started on his journey. It turned out that in fact he had known it before the captain made his request and before he himself made his vow; for he now remembered that a few hours *before* meeting the cruel captain he had had occasion to introduce himself to another captain, who had told him how matters actually stood. This officer, on hearing his name, had told him that he had been at the post office a short time before, and that the young lady there had asked him whether he knew a Lieutenant L. (the patient, that is), for whom a packet had arrived, to be paid for on delivery. The officer had replied that he did not, but the young lady had been of opinion that she could trust the unknown lieutenant and had said that in the meantime she would pay the charges herself. It had been in this way that the patient had come into possession of the pince-nez he had ordered. The cruel captain had made a mistake when, as he handed him over the packet, he had asked him to pay back the 3.80 *kronen* to A., and the patient must have known it was a mistake. In spite of this he had made a vow founded upon this mistake, a vow that was bound to be a torment to him. In so doing he had suppressed to himself, just as in telling the story he had suppressed to me, the episode of the other captain and the existence of the trusting young lady at the post office. I must admit that when this correction has been made his behaviour becomes even more senseless and unintelligible than before.

After he had left his friend and returned to his family his doubts had overtaken him afresh. His friend's arguments, he saw, had been no different from his own, and he was under no delusion that his temporary relief was attributable to anything more than his friend's personal influence. His determination to consult a doctor was woven into his delirium in the following ingenious manner. He thought he would get a doctor to give him a certificate to the effect that it was necessary for him, in order to recover his health, to perform some such action as he had planned in connection with Lieutenant A.; and the lieutenant would no doubt let himself be persuaded by the certificate into accepting the 3.80 crowns from him. The chance that one of my books happened to fall into his hands just at that moment directed his choice to me. There was no question of getting a certificate from me, however; all that he asked of me was, very reasonably, to be freed of his obsessions. Many months later, when his resistance was at its height, he once more felt a temptation to travel to P-- after all, to look up Lieutenant A. and to go through the farce of returning him the money.

(D) INITIATION INTO THE NATURE OF THE TREATMENT

The reader must not expect to hear at once what light I have to throw upon the patient's strange and senseless obsessions about the rats. The true technique of psycho-analysis requires the physician to suppress his curiosity and leaves the patient complete freedom in choosing the order in which topics shall succeed each other during the treatment. At the fourth session, accordingly, I received the patient with the question: 'And how do you intend to proceed to-day?'

'I have decided to tell you something which I consider most important and which has tormented me from the very first.' He then told me at great length the story of the last illness of his father, who had died of emphysema nine years previously. One evening, thinking that the condition was one which would come to a crisis, he had asked the doctor when the danger could be regarded as over. 'The evening of the day after to-morrow', had been the reply. It had never entered his head that his father might not survive that limit. At half-past eleven at night he had lain down for an hour's rest. He had woken up at one o'clock, and had been told by a medical friend that his father had died. He had reproached himself with not having been present at his death; and the reproach had been intensified when the nurse told him that his father had spoken his name once during the last days, and had said to her as she came up to the bed: 'Is that Paul?' He had thought he noticed that his mother and sisters had been inclined to reproach themselves in a similar way; but they had never spoken about it. At first, however, the reproach had not tormented him. For a long time he had not realized the fact of his father's death. It had constantly happened that, when he heard a good joke, he would say to himself: 'I must tell Father that.' His imagination, too, had been occupied with his father, so that often, when there was a knock at the door, he would think: 'Here comes Father', and when he walked into a room he would expect to find his father in it. And although he had never forgotten that his father was dead, the prospect of seeing a ghostly apparition of this kind had had no terrors for him; on the contrary, he had greatly desired it. It had not been until eighteen months later that the recollection of his neglect had recurred to him and begun to torment him terribly, so that he had come to treat himself as a criminal. The occasion of this happening had been the death of an aunt by marriage and of a visit of condolence that he had paid at her house. From that time forward he had extended the structure of his obsessional thoughts so as to include the next world. The immediate consequence of this development had been that he became seriously incapacitated from working.¹ He told me that the only thing that had kept him going at that time had been the consolation given him by his friend, who had always brushed his self-reproaches aside on the ground that they were grossly exaggerated. Hearing this, I took the opportunity of giving him a first glance at the underlying principles of psycho-analytic therapy. When there is a *mésalliance*, I began, between an affect and its ideational content (in this instance, between the intensity of the self-reproach and the occasion for it), a layman will say that the affect is too great for the occasion - that it is exaggerated and that consequently the inference following from the self-reproach (the inference that the patient is a criminal) is false. On the contrary, the physician says: 'No. The affect is justified. The sense of guilt is not in itself open to further criticism. But it belongs to some other content, which is unknown (*unconscious*), and which requires to be looked for. The known ideational content has only got into its actual position owing to a false connection. We are not used to feeling strong affects without their having any ideational content, and therefore, if the content is missing, we seize as a substitute upon some other content which is in some way or other suitable, much as our police, when they cannot catch the right murderer, arrest a wrong one instead. Moreover, this fact of there being a false connection is the only way of accounting for the powerlessness of logical processes to combat the tormenting idea.' I concluded by admitting that this new way of looking at the matter gave immediate rise to some hard problems; for how could he admit that his self-reproach of being a criminal towards his father was justified, when he must know that as a matter of fact he had never committed any crime against him?

¹ A more detailed description of the episode, which the patient gave me later on, made it possible to understand the effect that it produced on him. His uncle, lamenting the loss of his wife, had exclaimed: 'Other men allow themselves every possible indulgence, but I lived for this woman alone!' The patient had assumed that his uncle was alluding to his father and was casting doubts upon his conjugal fidelity; and although his uncle had denied this construction of his words most positively, it was no longer possible to counteract their effect.

At the next session the patient showed great interest in what I had said, but ventured, so he told me, to bring forward a few doubts. - How, he asked, could the information that the self-reproach, the sense of guilt, was justified have a therapeutic effect? - I explained that it was not the information that had this effect, but the discovery of the unknown content to which the self-reproach was really attached. - Yes, he said, that was the precise point to which his question had been directed. - I then made some short observations upon *the psychological differences between the conscious and the unconscious*, and upon the fact that everything conscious was subject to a process of wearing-away, while what was unconscious was relatively unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my room. They were, in fact, I said, only objects found in a tomb, and their burial had been their preservation: the destruction of Pompeii was only beginning now that it had been dug up. - Was there any guarantee, he next enquired, of what one's attitude would be towards what was discovered? One man, he thought, would no doubt behave in such a way as to get the better of his self-reproach, but another would not. - No, I said, it followed from the nature of the circumstances that in every case the affect would be overcome - for the most part during the progress of the work itself. Every effort was made to preserve Pompeii, whereas people were anxious to be rid of tormenting ideas like his. - He had said to himself, he went on, that a self-reproach could only arise from a breach of a person's own inner moral principles and not from that of any external ones. - I agreed, and said that the man who merely breaks an external law often regards himself as a hero. - Such an occurrence, he continued, was thus only possible where a *disintegration of the personality* was already present. Was there a possibility of his effecting a reintegration of his personality? If this could be done, he thought he would be able to make a success of his life, perhaps more of one than most people. - I replied that I was in complete agreement with this notion of a splitting of his personality. He had only to assimilate this new contrast, between a moral self and an evil one, with the contrast I had already mentioned, between the conscious and the unconscious. The moral self was the conscious, the evil self was the unconscious.¹ - He then said that, though he considered himself a moral person, he could quite definitely remember having done things in his *childhood* which came from his other self. - I remarked that here he had incidentally hit upon one of the chief characteristics of the unconscious, namely, its relation to the *infantile*. The unconscious, I explained, was the infantile; it was that part of the self which had become separated off from it in infancy, which had not shared the later stages of its development, and which had in consequence become *repressed*. It was the derivatives of this repressed unconscious that were responsible for the involuntary thoughts which constituted his illness. He might now, I added, discover yet another characteristic of the unconscious; it was a discovery which I should be glad to let him make for himself. - He found nothing more to say in this immediate connection, but instead he expressed a doubt whether it was possible to undo modifications of such long standing. What, in particular, could be done against his idea about the next world, for it could not be refuted by logic? - I told him I did not dispute the gravity of his case nor the significance of his pathological constructions; but at the same time his youth was very much in his favour as well as the intactness of his personality. In this connection I said a word or two upon the good opinion I had formed of him, and this gave him visible pleasure.

¹ All of this is of course only true in the roughest way, but it serves as a first introduction to the subject.

At the next session he began by saying that he must tell me an event in his childhood. From the age of seven, as he had already told me, he had had a fear that his parents guessed his thoughts, and this fear had in fact persisted all through his life. When he was twelve years old he had been in love with a little girl, the sister of a friend of his. (In answer to a question he said that his love had not been sensual; he had not wanted to see her naked for she was too small.) But she had not shown him as much affection as he had desired. And thereupon the idea had come to him that she would be kind to him if some misfortune were to befall him; and as an instance of such a misfortune his father's death had forced itself upon his mind. He had at once rejected the idea with energy. And even now he could not admit the possibility that what had arisen in this way could have been a 'wish'; it had clearly been no more than a 'train of thought'¹ - By way of objection I asked him why, if it had not been a wish, he had repudiated it. - Merely, he replied, on account of the content of the idea, the notion that his father might die. - I remarked that he was treating the phrase as though it were one that involved *lèse-majesté*; it was well known, of course, that it was equally punishable to say 'The Emperor is an ass' or to disguise the forbidden words by saying 'If any one says, etc., . . . then he will have me to reckon with.' I added that I could easily insert the idea which he had so energetically repudiated into a context which would exclude the possibility of any such repudiation: for instance, 'If my father dies, I shall kill myself upon his grave.' - He was shaken, but did not abandon his objection. I therefore broke off the argument with the remark that I felt sure this had not been the first occurrence of his idea of his father's dying; it had evidently originated at an earlier date, and some day we should have to trace back its history. - He then proceeded to tell me that a precisely similar thought had flashed through his mind a second time, six months before his father's death. At that time² he had already been in love with his lady, but financial obstacles made it impossible to think of an alliance with her. The idea had then occurred to him that *his father's death might make him rich enough to marry her*. In defending himself against this idea he had gone to the length of wishing that his father might leave him nothing at all, so that he might have no compensation for his terrible loss. The same idea, though in a much milder form, had come to him for a third time, on the day before his father's death. He had then thought: 'Now I may be going to lose what I love most'; and then had come the contradiction: 'No, there is some one else whose loss would be even more painful to you.'³ These thoughts surprised him very much, for he was quite certain that his father's death could never have been an object of his desire but only of his fear. - After his forcible enunciation of these words I thought it advisable to bring a fresh piece of theory to his notice. According to psycho-analytic theory, I told him, every fear corresponded to a former wish which was now repressed; we were therefore obliged to believe the exact contrary of what he had asserted. This would also fit in with another theoretical requirement, namely, that the unconscious must be the precise contrary of the conscious. - He was much agitated at this and very incredulous. He wondered how he could possibly have had such a wish, considering that he loved his father more than any one else in the world; there could be no doubt that he would have renounced all his own prospects of happiness if by so doing he could have saved his father's life. - I answered that it was precisely such intense love as his that was the necessary precondition of the repressed hatred. In the case of people to whom he felt indifferent he would certainly have no difficulty in maintaining side by side inclinations to a moderate liking and to an equally moderate dislike: supposing, for instance, that he were an official, he might think that his chief was agreeable as a superior, but at the same time pettifogging as a lawyer and inhuman as a judge. (Shakespeare makes Brutus speak in a similar way of Julius Caesar: 'As Caesar loved me, I weep for him; as he was fortunate, I rejoice at it; as he was valiant, I honour him; but, as he was ambitious, I slew him.' But these words already strike us as rather strange, and for the very reason that we had imagined Brutus's feeling for Caesar as something deeper.) In the case of some one who was closer to him, of his wife for instance, he would wish his feelings to be unmixed, and consequently, as was only human, he would overlook her faults, since they might make him dislike her - he would ignore them as though he were blind to them. So it was precisely the intensity of his love that would not allow his hatred - though to give it such a name was to caricature the feeling - to remain conscious. To be sure, the hatred must have a source, and to discover that source was certainly a problem; his own statements pointed to the time when he was afraid that his parents guessed his thoughts. On the other hand, too, it might be asked why this intense love of his had not succeeded in extinguishing his hatred, as usually happened where there were two opposing impulses. We could only presume that the hatred must flow from some source, must be connected with some particular cause, which made it indestructible. On the one hand, then, some connection of this sort must be keeping his hatred for his father alive, while on the other hand, his intense love prevented it from becoming conscious. Therefore nothing remained for it but to exist in the unconscious, though it was able from time to time to flash out for a moment into consciousness.

¹ Obsessional neurotics are not the only people who are satisfied with euphemisms of this kind.

² That is, ten years ago.

Notes Upon A Case Of Obsessional Neurosis

³ There is here an unmistakable indication of an opposition between the two objects of his love, his father and the 'lady'.

He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it.¹ He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. - To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. - He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. - At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of *sensual desires*, and in that connection he must have felt his father as in some way or other an *interference*. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. - He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. - I replied that it was scarcely possible to destroy a person *in absentia*. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a *long-repressed wish*, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. - With this piece of construction our discussion was broken off for the time being.

¹ It is never the aim of discussions like this to create conviction. They are only intended to bring the repressed complexes into consciousness, to set the conflict going in the field of conscious mental activity, and to facilitate the emergence of fresh material from the unconscious. A sense of conviction is only attained after the patient has himself worked over the reclaimed material, and so long as he is not fully convinced the material must be considered as unexhausted.

At the next session, which was the seventh, he took up the same subject once more. He could not believe, he said, that he had ever entertained such a wish against his father. He remembered a story of Sudermann's, he went on, that had made a deep impression upon him. In this story there was a woman who, as she sat by her sister's sick-bed, felt a wish that her sister should die so that she herself might marry her husband. The woman thereupon committed suicide, thinking she was not fit to live after being guilty of such baseness. He could understand this, he said, and it would be only right if his thoughts were the death of him, for he deserved nothing less.¹ - I remarked that it was well known to us that patients derived a certain satisfaction from their sufferings, so that in reality they all resisted their own recovery to some extent. He must never lose sight of the fact that a treatment like ours proceeded to the accompaniment of a *constant resistance*; I should be repeatedly reminding him of this fact.

He then went on to say that he would like to speak of a criminal act, whose author he did not recognize as himself, though he quite clearly recollected committing it. He quoted a saying of Nietzsche's:² "I did this," says my Memory. "I cannot have done this," says my Pride and remains inexorable. In the end - Memory yields.' 'Well,' he continued, 'my memory has *not* yielded on this point.' - 'That is because you derive pleasure from your self-reproaches as a means of self-punishment.' - 'My younger brother - I am really very fond of him now, and he is causing me a great deal of worry just at present, for he wants to make what I consider a preposterous match; I have thought before now of going and killing the person concerned so as to prevent his marrying her -well, my younger brother and I used to fight a lot when we were children. We were very fond of each other at the same time, and were inseparable; but I was plainly filled with jealousy, as he was the stronger and better-looking of the two and consequently the favourite.' - 'Yes. You have already given me a description of a scene of jealousy in connection with Fräulein Lina.' - 'Very well then, on some such occasion (it was certainly before I was eight years old, for I was not going to school yet, which I began to do when I was eight) - on some such occasion, this is what I did. We both had toy guns of the usual make. I loaded mine with the ram rod and told him that if he looked up the barrel he would see something. Then, while he was looking in, I pulled the trigger. He was hit on the forehead and not hurt; but I had meant to hurt him very much indeed. Afterwards I was quite beside myself, and threw myself on the ground and asked myself however I could have done such a thing. But I *did* do it.' - I took the opportunity of urging my case. If he had preserved the recollection of an action so foreign to him as this, he could not, I maintained, deny the possibility of something similar, which he had now forgotten entirely, having happened at a still earlier age in relation to his father. - He then told me he was aware of having felt other vindictive impulses, this time towards the lady he admired so much, of whose character he painted a glowing picture. It might be true, he said, that she could not love easily; but she was reserving her whole self for the one man to whom she would some day belong. She did not love him. When he had become certain of that, a conscious phantasy had taken shape in his mind of how he should grow very rich and marry some one else, and should then take her to call on the lady in order to hurt her feelings. But at that point the phantasy had broken down, for he had been obliged to own to himself that the other woman, his wife, was completely indifferent to him; then his thoughts had become confused, till finally it had been clearly borne in upon him that this other woman would have to die. In this phantasy, just as in his attempt upon his brother, he recognized the quality of *cowardice* which was so particularly horrible to him.³ - In the further course of our conversation I pointed out to him that he ought logically to consider himself as in no way responsible for any of these traits in his character; for all of these reprehensible impulses originated from his infancy, and were only derivatives of his infantile character surviving in his unconscious; and he must know that moral responsibility could not be applied to children. It was only by a process of development, I added, that a man, with his moral responsibility, grew up out of the sum of his infantile predispositions.⁴ He expressed a doubt, however, whether all his evil impulses had originated from that source. But I promised to prove it to him in the course of the treatment.

He went on to adduce the fact of his illness having become so enormously intensified since his father's death; and I said I agreed with him in so far as I regarded his sorrow at his father's death as the chief source of the *intensity* of his illness. His sorrow had found, as it were, a pathological expression in his illness. Whereas, I told him, a normal period of mourning would last from one to two years, a pathological one like this would last indefinitely.

This is as much of the present case history as I am able to report in a detailed and consecutive manner. It coincides roughly with the expository portion of the treatment; this lasted in all for more than eleven months.

¹ This sense of guilt involves the most glaring contradiction of his opening denial that he had ever entertained such an evil wish against his father. This is a common type of reaction to repressed material which has become conscious: the

Notes Upon A Case Of Obsessional Neurosis

'No' with which the fact is first denied is immediately followed by a confirmation of it, though, to begin with, only an indirect one.

² *Jenseits von Gut und Böse*, iv. 68.

³ This quality of his will find an explanation later on.

⁴ I only produced these arguments so as once more to demonstrate to myself their inefficacy. I cannot understand how other psychotherapists can assert that they successfully combat neuroses with such weapons as these.

(E) SOME OBSESSIONAL IDEAS AND THEIR EXPLANATION

Obsessional ideas, as is well known, have an appearance of being either without motive or without meaning, just a dreams have. The first problem is how to give them a sense and a status in the subject's mental life, so as to make them comprehensible and even obvious. The problem of translating them may seem insoluble; but we must never let ourselves be misled by that illusion. The wildest and most eccentric obsessional ideas can be cleared up if they are investigated deeply enough. The solution is effected by bringing the obsessional ideas into temporal relationship with the patient's experiences, that is to say, by enquiring when a particular obsessional idea made its first appearance and in what external circumstances it is apt to recur. When, as so often happens, an obsessional idea has not succeeded in establishing itself permanently, the task of clearing it up is correspondingly simplified. We can easily convince ourselves that, when once the interconnections between an obsessional idea and the patient's experiences have been discovered, there will be no difficulty in obtaining access to whatever else may be puzzling or worth knowing in the pathological structure we are dealing with - its meaning, the mechanism of its origin, and its derivation from the preponderant motive forces of the patient's mind.

As a particularly clear example I will begin with one of the *suicidal impulses* which appeared so frequently in our patient. This instance almost analysed itself in the telling. He had once, he told me, lost some weeks of study owing to his lady's absence: she had gone away to nurse her grandmother, who was seriously ill. Just as he was in the middle of a very hard piece of work the idea had occurred to him: 'If you received a command to take your examination this term at the first possible opportunity, you might manage to obey it. But if you were commanded to cut your throat with a razor, what then?' He had at once become aware that this command had already been given, and was hurrying to the cupboard to fetch his razor when he thought: 'No, it's not so simple as that. You must¹ go and kill the old woman.' Upon that, he had fallen to the ground, beside himself with horror.

In this instance the connection between the compulsive idea and the patient's life is contained in the opening words of his story. His lady was absent, while he was working very hard for an examination so as to bring the possibility of an alliance with her nearer. While he was working he was overcome by a longing for his absent lady, and he thought of the cause of her absence. And now there came over him something which, if he had been a normal man, would probably have been some kind of feeling of annoyance with her grandmother: 'Why must the old woman get ill just at the very moment when I'm longing for *her* so frightfully?' We must suppose that something similar but far more intense passed through our patient's mind - an unconscious fit of rage which could combine with his longing and find expression in the exclamation: 'Oh, I should like to go and kill that old woman for robbing me of my love!' Thereupon followed the command: 'Kill yourself, as a punishment for these savage and murderous passions!' The whole process then passed into the obsessional patient's consciousness accompanied by the most violent affect and *in a reverse order* - the punitive command coming first, and the mention of the guilty outburst afterwards. I cannot think that this attempt at an explanation will seem forced or that it involves many hypothetical elements.

¹ The sense requires that the word 'first' should be interpolated here.

Another impulse, which might be described as *indirectly* suicidal and which was of longer duration, was not so easily explicable. For its relation to the patient's experiences succeeded in concealing itself behind one of those purely external associations which are so obnoxious to our consciousness. One day while he was away on his summer holidays the idea suddenly occurred to him that he was too fat [German '*dick*'] and that he must *make himself slimmer*. So he began getting up from table before the pudding came round and tearing along the road without a hat in the blazing heat of an August sun. Then he would dash up a mountain at the double, till, dripping with perspiration, he was forced to come to a stop. On one occasion his suicidal intentions actually emerged without any disguise from behind this mania for slimming: as he was standing on the edge of a steep precipice he suddenly received a command to jump over, which would have been certain death. Our patient could think of no explanation of this senseless obsessional behaviour until it suddenly occurred to him that at that time his lady had also been stopping at the same resort; but she had been in the company of an English cousin, who was very attentive to her and of whom the patient had been very jealous. This cousin's name was Richard, and, according to the usual practice in England, he was known as *Dick*. Our patient, then, had wanted to kill this Dick; he had been far more jealous of him and enraged with him than he could admit to himself, and that was why he had imposed on himself this course of slimming by way of a punishment. This obsessional impulse may seem very different from the directly suicidal command which was discussed above, but they have nevertheless one important feature in common. For they both arose as reactions to a tremendous feeling of rage, which was inaccessible to the patient's consciousness and was directed against some one who had cropped up as an interference with the course of his love.¹

¹ Names and words are not nearly so frequently or so recklessly employed in obsessional neuroses as in hysteria for the purpose of establishing a connection between unconscious thoughts (whether they are impulses or phantasies) and symptoms. I happen, however, to recollect another instance in which the very same name, Richard, was similarly used by a patient whom I analysed a long time since. After a quarrel with his brother he began brooding over the best means of getting rid of his fortune, and declaring that he did not want to have anything more to do with money, and so on. His brother was called Richard, and '*richard*' is the French for 'a rich man'.

Some other of the patient's obsessions, however, though they too were centred upon his lady, exhibited a different mechanism and owed their origin to a different instinct. Besides his slimming mania he produced a whole series of other obsessional activities at the period during which the lady was stopping at his summer resort; and, in part at least, these directly related to her. One day, when he was out with her in a boat and there was a stiff breeze blowing, he was obliged to make her put on his cap, because a command had been formulated in his mind that *nothing must happen to her*.¹ This was a kind of *obsession for protecting*, and it bore other fruit besides this. Another time, as they were sitting together during a thunderstorm, he was obsessed, he could not tell why, with the *necessity for counting* up to forty or fifty between each flash of lightning and its accompanying thunder-clap. On the day of her departure he knocked his foot against a stone lying in the road, and was *obliged* to put it out of the way by the side of the road, because the idea struck him that her carriage would be driving along the same road in a few hours' time and might come to grief against this stone. But a few minutes later it occurred to him that this was absurd, and he was *obliged* to go back and replace the stone in its original position in the middle of the road. After her departure he became a prey to an *obsession for understanding*, which made him a curse to all his companions. He forced himself to understand the precise meaning of every syllable that was addressed to him, as though he might otherwise be missing some priceless treasure. Accordingly he kept asking: 'What was it you said just then?' And after it had been repeated to him he could not help thinking it had sounded different the first time, so he remained dissatisfied.

¹ The words 'for which he might be to blame' must be added to complete the sense.

All of these products of his illness depended upon a certain circumstance which at that time dominated his relations to his lady. When he had been taking leave of her in Vienna before the summer holidays, she had said something which he had construed into a desire on her part to disown him before the rest of the company; and this had made him very unhappy. During her stay at the holiday resort there had been an opportunity for discussing the question, and the lady had been able to prove to him that these words of hers which he had misunderstood had on the contrary been intended to save him from looking ridiculous. This made him very happy again. The clearest allusion to this incident was contained in the obsession for understanding. It was constructed as though he were saying to himself: 'After such an experience you must never misunderstand any one again, if you want to spare yourself unnecessary distress.' This resolution was not merely a generalization from a single occasion, but it was also displaced - perhaps on account of the lady's absence - from a single highly valued individual on to all the remaining inferior ones. And the obsession cannot have arisen solely from his satisfaction at the explanation she had given him; it must have expressed something else besides, for it ended in an unsatisfying doubt as to whether what he had heard had been correctly repeated.

The other compulsive commands that have been mentioned put us upon the track of this other element. His obsession for protecting can only have been a reaction - as an expression of remorse and penitence - to a contrary, that is a hostile, impulse which he must have felt towards his lady before they had their *éclaircissement*. His obsession for counting during the thunderstorm can be interpreted, with the help of some material which he produced, as having been a defensive measure against fears that some one was in danger of death. The analysis of the obsessions which we first considered has already warned us to regard our patient's hostile impulses as particularly violent and as being in the nature of senseless rage; and now we find that even after their reconciliation his rage against the lady continued to play a part in the formation of his obsessions. His doubting mania as to whether he had heard correctly was an expression of the doubt still lurking in his mind, whether he had really understood his lady correctly this time and whether he had been justified in taking her words as a proof of her affection for him. The doubt implied in his obsession for understanding was a doubt of her love. A battle between love and hate was raging in the lover's breast, and the object of both these feelings was one and the same person. The battle was represented in a plastic form by his compulsive and symbolic act of removing the stone from the road along which she was to drive, and then of undoing this deed of love by replacing the stone where it had lain, so that her carriage might come to grief against it and she herself be hurt. We shall not be forming a correct judgement of this second part of the compulsive act if we take it at its face value as having merely been a critical repudiation of a pathological action. The fact that it was accompanied by a sense of compulsion betrays it as having itself been a part of the pathological action, though a part which was determined by a motive contrary to that which produced the first part.

Compulsive acts like this, in two successive stages, of which the second neutralizes the first, are a typical occurrence in obsessional neuroses. The patient's consciousness naturally misunderstands them and puts forward a set of secondary motives to account for them - *rationalizes* them, in short. (Cf. Jones, 1908.) But their true significance lies in their being a representation of a conflict between two opposing impulses of approximately equal strength: and hitherto I have invariably found that this opposition has been one between love and hate. Compulsive acts of this sort are theoretically of special interest, for they show us a new type of method of constructing symptoms. What regularly occurs in hysteria is that a compromise is arrived at which enables both the opposing tendencies to find expression simultaneously - which kills two birds with one stone;¹ whereas here each of the two opposing tendencies finds satisfaction singly, first one and then the other, though naturally an attempt is made to establish some sort of logical connection (often in defiance of all logic) between the antagonists.²

¹ Cf. 'Hysterical Phantasies and their Relation to Bisexuality' (Freud, 1908a).

² Another obsessional patient once told me the following story. He was walking one day in the park at Schönbrunn when he kicked his foot against a branch that was lying on the ground. He picked it up and flung it into the hedge that bordered the path. On his way home he was suddenly seized with uneasiness that the branch in its new position might perhaps be projecting a little from the hedge and might cause an injury to some one passing by the same place after him. He was obliged to jump off his tram, hurry back to the park, find the place again, and put the branch back in its former position - although any one else but the patient would have seen that, on the contrary, it was bound to be more dangerous to passers-by in its original position than where he had put it in the hedge. The second and hostile act, which he carried out under compulsion, had clothed itself to his conscious view with the motives that really belonged to the first and philanthropic one.

The conflict between love and hatred showed itself in our patient by other signs as well. At the time of the revival of his piety he made up prayers for himself, which took up more and more time and eventually lasted for an hour and a half. The reason for this was that he found, like an inverted Balaam, that something always inserted itself into his pious phrases and turned them into their opposite. E.g., if he said, 'May God protect him', an evil spirit would hurriedly insinuate a 'not'.¹ On one such occasion the idea occurred to him of cursing instead, for in that case, he thought, the contrary words would be sure to creep in. His original intention, which had been repressed by his praying, was forcing its way through in this last idea of his. In the end he found his way out of his embarrassment by giving up the prayers and replacing them by a short formula concocted out of the initial letters or syllables of various prayers. He then recited this formula so quickly that nothing could slip into it.

He once brought me a dream which represented the same conflict in relation to his transference on to the physician. He dreamt that my mother was dead; he was anxious to offer me his condolences, but was afraid that in doing so he might break into *an impertinent laugh*, as he had repeatedly done on similar occasions in the past. He preferred, therefore, to leave a card on me with 'p. c.' written on it; but as he was writing them the letters turned into 'p. f.'²

¹ Compare the similar mechanism in the familiar case of sacrilegious thoughts entering the minds of devout persons.

² [The customary abbreviations for '*pour condoler*' and '*pour féliciter*' respectively.] This dream provides the explanation of the compulsive laughter which so often occurs on mournful occasions and which is regarded as such an unaccountable phenomenon.

The mutual antagonism between his feelings for his lady was too marked to have escaped his conscious perception entirely, although we may conclude from the obsessions in which it was manifested that he did not rightly appreciate the depth of his negative impulses. The lady had refused his first proposal, ten years earlier. Since then he had to his own knowledge passed through alternating periods, in which he either believed that he loved her intensely, or felt indifferent to her. Whenever in the course of the treatment he was faced by the necessity of taking some step which would bring him nearer the successful end of his courtship, his resistance usually began by taking the form of a conviction that after all he did not very much care for her - though this resistance, it is true, used soon to break down. Once when she was lying seriously ill in bed and he was most deeply concerned about her, there crossed his mind as he looked at her a wish that she might lie like that for ever. He explained this idea by an ingenious piece of sophistry: maintaining that he had only wished her to be permanently ill so that he might be relieved of his intolerable fear that she would have a repeated succession of attacks!¹ Now and then he used to occupy his imagination with day-dreams, which he himself recognized as 'phantasies of revenge' and felt ashamed of. Believing, for instance, that the lady set great store by the social standing of a suitor, he made up a phantasy in which she was married to a man of that kind, who was in some government office. He himself then entered the same department, and rose much more rapidly than her husband, who eventually became his subordinate. One day, his phantasy proceeded, this man committed some act of dishonesty. The lady threw herself at his feet and implored him to save her husband. He promised to do so, and informed her that it had only been for love of her that he had entered the service, because he had foreseen that such a moment would occur; and now that her husband was saved, his own mission was fulfilled and he would resign his post.

He produced other phantasies in which he did the lady some great service without her knowing that it was he who was doing it. In these he only recognized his affection, without sufficiently appreciating the origin and aim of his magnanimity, which was designed to repress his thirst for revenge, after the manner of Dumas' Count of Monte-Cristo. Moreover he admitted that occasionally he was overcome by quite distinct impulses to do some mischief to the lady he admired. These impulses were mostly in abeyance when she was there, and only appeared in her absence.

¹ It cannot be doubted that another contributory motive to this compulsive idea was a wish to know that she was powerless against his designs.

(F) THE PRECIPITATING CAUSE OF THE ILLNESS

One day the patient mentioned quite casually an event which I could not fail to recognize as the precipitating cause of his illness, or at least as the immediate occasion of the attack which had begun some six years previously and had persisted to that day. He himself had no notion that he had brought forward anything of importance; he could not remember that he had ever attached any importance to the event; and moreover he had never forgotten it. Such an attitude on his part calls for some theoretical consideration.

In hysteria it is the rule that the precipitating causes of the illness are overtaken by amnesia no less than the infantile experiences by whose help the precipitating causes are able to transform their affective energy into symptoms. And where the amnesia cannot be complete, it nevertheless subjects the recent traumatic precipitating cause to a process of erosion and robs it at least of its most important components. In this amnesia we see the evidence of the repression which has taken place. The case is different in obsessional neuroses. The infantile preconditions of the neurosis may be overtaken by amnesia, though this is often an incomplete one; but the immediate occasions of the illness are, on the contrary, retained in the memory. Repression makes use of another, and in reality a simpler, mechanism. The trauma, instead of being forgotten, is deprived of its affective cathexis; so that what remains in consciousness is nothing but its ideational content, which is perfectly colourless and is judged to be unimportant. The distinction between what occurs in hysteria and in an obsessional neurosis lies in the psychological processes which we can reconstruct behind the phenomena; the *result* is almost always the same, for the colourless mnemonic content is rarely reproduced and plays no part in the patient's mental activity. In order to differentiate between the two kinds of repression we have on the surface nothing to rely upon but the patient's assurance that he has a feeling in the one case of having always known the thing and in the other of having long ago forgotten it.¹

¹ It must therefore be admitted that in an obsessional neurosis there are two kinds of knowledge, and it is just as reasonable to hold that the patient 'knows' his traumas as that he does *not* 'know' them. For he knows them in that he has not forgotten them, and he does not know them in that he is unaware of their significance. It is often the same in ordinary life. The waiters who used to serve Schopenhauer at his regular restaurant 'knew' him in a certain sense, at a time when, apart from that, he was not known either in Frankfurt or outside it; but they did not 'know' him in the sense in which we speak to-day of 'knowing' Schopenhauer.

For this reason it not uncommonly happens that obsessional neurotics, who are troubled with self-reproaches but have connected their affects with the wrong causes, will also tell the physician the true causes, without any suspicion that their self-reproaches have simply become detached from them. In relating such an incident they will sometimes add with astonishment or even with an air of pride: 'But I think nothing of that.' This happened in the first case of obsessional neurosis which gave me an insight many years ago into the nature of the malady. The patient, who was a government official, was troubled by innumerable scruples. He was the man whose compulsive act in connection with the branch in the park at Schönbrunn I have already described. I was struck by the fact that the florin notes with which he paid his consultation fees were invariably clean and smooth. (This was before we had a silver coinage in Austria.) I once remarked to him that one could always tell a government official by the brand-new florins that he drew from the State treasury, and he then informed me that his florins were by no means new, but that he had them ironed out at home. It was a matter of conscience with him, he explained, not to hand any one dirty paper florins; for they harboured all sorts of dangerous bacteria and might do some harm to the recipient. At that time I already had a vague suspicion of the connection between neuroses and sexual life, so on another occasion I ventured to ask the patient how he stood in regard to that matter. 'Oh, that's quite all right,' he answered airily, 'I'm not at all badly off in that respect. I play the part of a dear old uncle in a number of respectable families, and now and then I make use of my position to invite some young girl to go out with me for a day's excursion in the country. Then I arrange that we shall miss the train home and be obliged to spend the night out of town. I always engage two rooms - I do things most handsomely; but when the girl has gone to bed I go in to her and masturbate her with my fingers.' - 'But aren't you afraid of doing her some harm, fiddling about in her genitals with your dirty hand?' - At this he flared up: 'Harm? Why, what harm should it do her? It hasn't done a single one of them any harm yet, and they've all of them enjoyed it. Some of them are married now, and it hasn't done them any harm at all.' - He took my remonstrance in very bad part, and never appeared again. But I could only account for the contrast between his fastidiousness with the paper florins and his unscrupulousness in abusing the girls entrusted to him by supposing that the self-reproachful affect had become *displaced*. The aim of this displacement was obvious enough: if his self-reproaches had been allowed to remain where they belonged he would have had to abandon a form of sexual gratification to which he was probably impelled by some powerful infantile determinants. The displacement therefore ensured his deriving a considerable advantage from his illness.

But I must now return to a more detailed examination of the precipitating cause of our present patient's illness. His mother was brought up in a wealthy family with which she was distantly connected. This family carried on a large industrial concern. His father, at the time of his marriage, had been taken into the business, and had thus by his marriage made himself a fairly comfortable position. The patient had learnt from some chaff exchanged between his parents (whose marriage was an extremely happy one) that his father, some time before making his mother's acquaintance, had made advances to a pretty but penniless girl of humble birth. So much by way of introduction. After his father's death the patient's mother told him one day that she had been discussing his future with her rich relations, and that one of her cousins had declared himself ready to let him marry one of his daughters when his education was completed; a business connection with the firm would offer him a brilliant opening in his profession. This family plan stirred up in him a conflict as to whether he should remain faithful to the lady he loved in spite of her poverty, or whether he should follow in his father's footsteps and marry the lovely, rich, and well-connected girl who had been assigned to him. And he resolved this conflict, which was in fact one between his love and the persisting influence of his father's wishes, by falling ill; or, to put it more correctly, by falling ill he avoided the task of resolving it in real life.¹

¹ It is worth emphasizing that his flight into illness was made possible by his identifying himself with his father. The identification enabled his affects to regress on to the residue of his childhood.

The proof that this view was correct lies in the fact that the chief result of his illness was an obstinate incapacity for work, which allowed him to postpone the completion of his education for years. But the results of such an illness are never unintentional; what appears to be the *consequence* of the illness is in reality the *cause* or *motive* of falling ill.

As was to be expected, the patient did not, to begin with, accept my elucidation of the matter. He could not imagine, he said, that the plan of marriage could have had any such effects: it had not made the slightest impression on him at the time. But in the further course of treatment he was forcibly brought to believe in the truth of my suspicion, and in a most singular manner. With the help of a transference phantasy, he experienced, as though it were new and belonged to the present, the very episode from the past which he had forgotten, or which had only passed through his mind unconsciously. There came an obscure and difficult period in the treatment; eventually it turned out that he had once met a young girl on the stairs in my house and had on the spot promoted her into being my daughter. She had pleased him, and he pictured to himself that the only reason I was so kind and incredibly patient with him was that I wanted to have him for a son-in-law. At the same time he raised the wealth and position of my family to a level which agreed with the model he had in mind. But his undying love for his lady fought against the temptation. After we had gone through a series of the severest resistances and bitterest vituperations on his part, he could no longer remain blind to the overwhelming effect of the perfect analogy between the transference phantasy and the actual state of affairs in the past. I will repeat one of the dreams which he had at this period, so as to give an example of his manner of treating the subject. He dreamt that *he saw my daughter in front of him; she had two patches of dung instead of eyes*. No one who understands the language of dreams will find much difficulty in translating this one: it declared that *he was marrying my daughter not for her 'beaux yeux' but for her money*.

(G) THE FATHER COMPLEX AND THE SOLUTION OF THE RAT IDEA

From the precipitating cause of the patient's illness in his adult years there was a thread leading back to his childhood. He had found himself in a situation similar to that in which, as he knew or suspected, his father had been before *his* marriage; and he had thus been able to identify himself with his father. But his dead father was involved in his recent attack in yet another way. The conflict at the root of his illness was in essentials a struggle between the persisting influence of his father's wishes and his own amatory predilections. If we take into consideration what the patient reported in the course of the first hours of his treatment, we shall not be able to avoid a suspicion that this struggle was a very ancient one and had arisen as far back as in his childhood.

By all accounts our patient's father was a most excellent man. Before his marriage he had been a non-commissioned officer, and, as relics of that period of his life, he had retained a straightforward soldierly manner and a *penchant* for using downright language. Apart from those virtues which are celebrated upon every tombstone, he was distinguished by a hearty sense of humour and a kindly tolerance towards his fellow-men. That he could be hasty and violent was certainly not inconsistent with his other qualities, but was rather a necessary complement to them; but it occasionally brought down the most severe castigations upon the children, while they were young and naughty. When they grew up, however, he differed from other fathers in not attempting to exalt himself into a sacrosanct authority, but in sharing with them a knowledge of the little failures and misfortunes of his life with good-natured candour. His son was certainly not exaggerating when he declared that they had lived together like the best of friends, except upon a single point (p. 2145). And it must no doubt have been in connection with that very point that thoughts about his father's death had occupied his mind when he was a small boy with unusual and undue intensity (p. 2133), and that those thoughts made their appearance in the wording of the obsessional ideas of his childhood; and it can only have been in that same connection that he was able to wish for his father's death, in order that a certain little girl's sympathy might be aroused and that she might behave more kindly towards him (p. 2144).

There can be no question that there was something in the sphere of sexuality that stood between the father and son, and that the father had come into some sort of opposition to the son's prematurely developed erotic life. Several years after his father's death, the first time he experienced the pleasurable sensations of copulation, an idea sprang into his mind: 'This is glorious! One might murder one's father for this!' This was at once an echo and an elucidation of the obsessional ideas of his childhood. Moreover, his father, shortly before his death, had directly opposed what later became our patient's dominating passion. He had noticed that his son was always in the lady's company, and had advised him to keep away from her, saying that it was imprudent of him and that he would only make a fool of himself.

To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation *during puberty*, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors; for the patients have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree autonomous - that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation - that is, a certain amount of it - without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.¹

¹ See *Three Essays on the Theory of Sexuality*, 1905d.

Our present patient's behaviour in the matter of masturbation was most remarkable. He did not practise it during puberty and therefore, according to one set of views, he might have expected to be exempt from neurosis. On the other hand, an impulsion towards masturbatory activities came over him in his twenty-first year, *shortly after his father's death*. He felt very much ashamed of himself each time he gave way to this kind of gratification, and soon foreswore the habit. From that time onwards it reappeared only upon rare and extraordinary occasions. It was provoked, he told me, when he experienced especially fine moments, or when he read especially fine passages. It occurred once, for instance, on a lovely summer's afternoon when, in the middle of Vienna, he heard a postilion blowing his horn in the most wonderful way - until a policeman stopped him, because blowing horns is not allowed in the centre of the town. And another time it happened when he read in *Dichtung und Wahrheit* how the young Goethe had freed himself in a burst of tenderness from the effects of a curse which a jealous mistress had pronounced upon the next woman who should kiss his lips after her; he had long, almost superstitiously, suffered the curse to hold him back, but now he broke his bonds and kissed his love joyfully again and again.

It seemed to the patient not a little strange that he should be impelled to masturbate precisely upon such beautiful and uplifting occasions as these. But I could not help pointing out that these two occasions had something in common - a prohibition, and the defiance of a command.

We must also consider in the same connection his curious behaviour at a time when he was working for an examination and toying with his favourite phantasy that his father was still alive and might at any moment reappear. He used to arrange that his working hours should be as late as possible in the night. Between twelve and one o'clock at night he would interrupt his work, and open the front door of the flat as though his father were standing outside it; then, coming back into the hall, he would take out his penis and look at it in the looking-glass. This crazy conduct becomes intelligible if we suppose that he was acting as though he expected a visit from his father at the hour when ghosts are abroad. He had on the whole been idle at his work during his father's lifetime, and this had often been a cause of annoyance to his father. And now that he was returning as a ghost, he was to be delighted at finding his son hard at work. But it was impossible that his father should be delighted at the other part of his behaviour; in this therefore he must be defying him. Thus, in a single unintelligible obsessional act, he gave expression to the two sides of his relation with his father, just as he did subsequently with regard to his lady by means of his obsessional act with the stone.

Starting from these indications and from other data of a similar kind, I ventured to put forward a construction to the effect that when he was a child of under six he had been guilty of some sexual misdemeanour connected with masturbation and had been soundly castigated for it by his father. This punishment, according to my hypothesis, had, it was true, put an end to his masturbating, but on the other hand it had left behind it an ineradicable grudge against his father and had established him for all time in his role of an interferer with the patient's sexual enjoyment.¹ To my great astonishment the patient then informed me that his mother had repeatedly described to him an occurrence of this kind which dated from his earliest childhood and had evidently escaped being forgotten by her on account of its remarkable consequences. He himself, however, had no recollection of it whatever. The tale was as follows. When he was very small - it became possible to establish the date more exactly owing to its having coincided with the fatal illness of an elder sister - he had done something naughty, for which his father had given him a beating. The little boy had flown into a terrible rage and had hurled abuse at his father even while he was under his blows. But as he knew no bad language, he had called him all the names of common objects that he could think of, and had screamed: 'You lamp! You towel! You plate!' and so on. His father, shaken by such an outburst of elemental fury, had stopped beating him, and had declared: 'The child will be either a great man or a great criminal!'² The patient believed that the scene made a permanent impression upon himself as well as upon his father. His father, he said, never beat him again; and he also attributed to this experience a part of the change which came over his own character. From that time forward he was a coward - out of fear of the violence of his own rage. His whole life long, moreover, he was terribly afraid of blows, and used to creep away and hide, filled with terror and indignation, when one of his brothers or sisters was beaten.

¹ Compare my suspicions to a similar effect in one of the first sessions (p. 2145).

² These alternatives did not exhaust the possibilities. His father had overlooked the commonest outcome of such premature passions - a neurosis.

The patient subsequently questioned his mother again. She confirmed the story, adding that at the time he had been between three and four years old and that he had been given the punishment because he had *bitten* some one. She could remember no further details, except for a very uncertain idea that the person the little boy had hurt might have been his nurse. In her account there was no suggestion of his misdeed having been of a sexual nature.¹

¹ In psycho-analyses we frequently come across occurrences of this kind, dating back to the earliest years of the patient's childhood, in which his infantile sexual activity appears to reach its climax and often comes to a catastrophic end owing to some misfortune or punishment. Such occurrences are apt to appear in a shadowy way in dreams. Often they will become so clear that the analyst thinks he has a firm hold of them, and will nevertheless evade any final elucidation; and unless he proceeds with the greatest skill and caution he may be compelled to leave it undecided whether the scene in question actually took place or not. It will help to put us upon the right track in interpreting it, if we recognize that more than one version of the scene (each often differing greatly from the other) may be detected in the patient's unconscious phantasies. If we do not wish to go astray in our judgement of their historical reality, we must above all bear in mind that people's 'childhood memories' are only consolidated at a later period, usually at the age of puberty; and that this involves a complicated process of remodelling, analogous in every way to the process by which a nation constructs legends about its early history. It at once becomes evident that in his phantasies about his infancy the individual as he grows up *endeavours to efface the recollection of his auto-erotic activities*; and this he does by exalting their memory-traces to the level of object-love, just as a real historian will view the past in the light of the present. This explains why these phantasies abound in seductions and assaults, where the facts will have been confined to auto-erotic activities and the caresses or punishments that stimulated them. Furthermore, it becomes clear that in constructing phantasies about his childhood the individual *sexualizes his memories*; that is, he brings commonplace experiences into relation with his sexual activity, and extends his sexual interest to them - though in doing this he is probably following upon the traces of a really existing connection. No one who remembers my 'Analysis of a Phobia in a Five-Year-Old Boy' will need to be told that it is not my intention in these remarks to detract from the importance which I have hitherto attached to infantile sexuality by reducing it to nothing more than sexual interest at the age of puberty. I merely wish to give some technical advice that may help to clear up a class of phantasy which is calculated to falsify the picture of infantile sexual activity.

It is seldom that we are in the fortunate position of being able, as in the present instance, to establish the facts upon which these tales of the individual's prehistoric past are based, by recourse to the unimpeachable testimony of a grown-up person. Even so, the statement made by our patient's mother leaves the way open to various possibilities. That she did not proclaim the sexual character of the offence for which the child was punished may have been due to the activity of her own censorship; for with all parents it is precisely this sexual element in their children's past that their own censorship is most anxious to eliminate. But it is just as possible that the child was reproved by his nurse or by his mother herself for some commonplace piece of naughtiness of a non-sexual nature, and that his reaction was so violent that he was castigated by his father. In phantasies of this kind nurses and servants are regularly replaced by the superior figure of the mother. A deeper interpretation of the patient's dreams in relation to this episode revealed the clearest traces of the presence in his mind of an imaginative production of a positively epic character. In this his sexual desires for his mother and sister and his sister's premature death were linked up with the young hero's chastisement at his father's hand. It was impossible to unravel this tissue of phantasy thread by thread; the therapeutic success of the treatment was precisely what stood in the way of this. The patient recovered, and his ordinary life began to assert its claims: there were many tasks before him, which he had already neglected far too long, and which were incompatible with a continuation of the treatment. I am not to be blamed, therefore, for this gap in the analysis. The scientific results of psycho-analysis are at present only a by-product of its therapeutic aims, and for that reason it is often just in those cases where treatment fails that most discoveries are made.

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called *the nuclear complex of the neuroses*. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about.

A discussion of this childhood scene will be found in the footnote, and here I will only remark that its emergence shook the patient for the first time in his refusal to believe that at some prehistoric period in his childhood he had been seized with fury (which had subsequently become latent) against the father whom he loved so much. I must confess that I had expected it to have a greater effect, for the incident had been described to him so often - even by his father himself - that there could be no doubt of its objective reality. But, with that capacity for being illogical which never fails to bewilder one in such highly intelligent people as obsessional neurotics, he kept urging against the evidential value of the story the fact that he himself could not remember the scene. And so it was only along the painful road of transference that he was able to reach a conviction that his relation to his father really necessitated the postulation of this unconscious complement. Things soon reached a point at which, in his dreams, his waking phantasies, and his associations, he began heaping the grossest and filthiest abuse upon me and my family, though in his deliberate actions he never treated me with anything but the greatest respect. His demeanour as he repeated these insults to me was that of a man in despair. 'How can a gentleman like you, sir,' he used to ask, 'let yourself be abused in this way by a low, good-for-nothing fellow like me? You ought to turn me out: that's all I deserve.' While he talked like this, he would get up from the sofa and roam about the room, - a habit which he explained at first as being due to delicacy of feeling: he could not bring himself, he said, to utter such horrible things while he was lying there so comfortably. But soon he himself found a more cogent explanation, namely, that he was avoiding my proximity for fear of my giving him a beating. If he stayed on the sofa he behaved like some one in desperate terror trying to save himself from castigations of terrific violence; he would bury his head in his hands, cover his face with his arm, jump up suddenly and rush away, his features distorted with pain, and so on. He recalled that his father had had a passionate temper, and sometimes in his violence had not known where to stop. Thus, little by little, in this school of suffering, the patient won the sense of conviction which he had lacked - though to any disinterested mind the truth would have been almost self-evident.

And now the path was clear to the solution of his rat idea. The treatment had reached its turning-point, and a quantity of material information which had hitherto been withheld became available, and so made possible a reconstruction of the whole concatenation of events.

In my description I shall, as I have already said, content myself with the briefest possible summary of the circumstances. Obviously the first problem to be solved was why the two speeches of the Czech captain - his rat story, and his request to the patient that he should pay back the money to Lieutenant A. - should have had such an agitating effect on him and should have provoked such violently pathological reactions. The presumption was that it was a question of 'complexive sensitiveness', and that the speeches had jarred upon certain hyperaesthetic spots in his unconscious. And so it proved to be. As always happened with the patient in connection with military matters, he had been in a state of unconscious identification with his father, who had seen many years' service and had been full of stories of his soldiering days. Now it happened by chance - for chance may play a part in the formation of a symptom, just as the wording may help in the making of a joke - that one of his father's little adventures had an important element in common with the captain's request. His father, in his capacity as non-commissioned officer, had control over a small sum of money and had on one occasion lost it at cards. (Thus he had been a '*Spielratte*'.¹) He would have found himself in a serious position if one of his comrades had not advanced him the amount. After he had left the army and become well-off, he had tried to find this friend in need so as to pay him back the money, but had not managed to trace him. The patient was uncertain whether he had ever succeeded in returning the money. The recollection of this sin of his father's youth was painful to him, for, in spite of appearances, his unconscious was filled with hostile strictures upon his father's character. The captain's words, 'You must pay back the 3.80 *kronen* to Lieutenant A.', had sounded to his ears like an allusion to this unpaid debt of his father's.

¹ [Literally, 'play-rat'. Colloquial German for 'gambler'.]

But the information that the young lady at the post office at Z-- had herself paid the charges due upon the packet, with a complimentary remark about himself,¹ had intensified his identification with his father in quite another direction. At this stage in the analysis he brought out some new information, to the effect that the landlord of the inn at the little place where the post office was had had a pretty daughter. She had been decidedly encouraging to the smart young officer, so that he had thought of returning there after the manoeuvres were over and of trying his luck with her. Now, however, she had a rival in the shape of the young lady at the post office. Like his father in the tale of his marriage, he could afford now to hesitate upon which of the two he should bestow his favours when he had finished his military service. We can see at once that his singular indecision whether he should travel to Vienna or go back to the place where the post office was, and the constant temptation he felt to turn back while he was on the journey (p. 2140), were not so senseless as they seemed to us at first. To his conscious mind, the attraction exercised upon him by Z--, the place where the post office was, was explained by the necessity of seeing Lieutenant A. and fulfilling the vow with his assistance. But in reality what was attracting him was the young lady at the post office, and the lieutenant was merely a good substitute for her, since he had lived at the same place and had himself been in charge of the military postal service. And when subsequently he heard that it was not Lieutenant A. but another officer B., who had been on duty at the post office that day, he drew *him* into his combination as well; and he was then able to reproduce in his deliria in connection with the two officers the hesitation he felt between the two girls who were so kindly disposed towards him.²

¹ It must not be forgotten that he had learnt this *before* the captain, owing to a misapprehension, requested him to pay back the money to Lieutenant A. This circumstance was the vital point of the story, and by suppressing it the patient reduced himself to a state of the most hopeless muddle and for some time prevented me from getting any idea of the meaning of it all.

² (Footnote added 1923:) My patient did his very best to throw confusion over the little episode of the repayment of the charges for his pince-nez, so that perhaps my own account of it may also have failed to clear it up entirely. I therefore reproduce here a little map (Fig. 5), by means of which Mr. and Mrs. Strachey have endeavoured to make the situation at the end of the manoeuvres plainer. My translators have justly observed that the patient's behaviour remains unintelligible so long as a further circumstance is not expressly stated, namely, that Lieutenant A. had formerly lived at the place Z-- where the post office was situated and had been in charge of the military post office there, but that during the last few days he had handed over this billet to Lieutenant B. and had been transferred to another village. The 'cruel' captain had been in ignorance of this transfer, and this was the explanation of his mistake in supposing that the charges had to be paid back to Lieutenant A.

Fig. 5.

In elucidating the effects produced by the captain's rat story we must follow the course of the analysis more closely. The patient began by producing an enormous mass of associative material, which at first, however, threw no light upon the circumstances in which the formation of his obsession had taken place. The idea of the punishment carried out by means of rats had acted as a stimulus to a number of his instincts and had called up a whole quantity of recollections; so that, in the short interval between the captain's story and his request to him to pay back the money, rats had acquired a series of symbolic meanings, to which, during the period which followed, fresh ones were continually being added. I must confess that I can only give a very incomplete account of the whole business. What the rat punishment stirred up more than anything else was his *anal erotism*, which had played an important part in his childhood and had been kept in activity for many years by a constant irritation due to worms. In this way rats came to have the meaning of '*money*'.¹ The patient gave an indication of this connection by reacting to the word '*Ratten*' ['rats'] with the association '*Raten*' ['instalments']. In his obsessional deliria he had coined himself a regular rat currency. When, for instance, in reply to a question, I told him the amount of my fee for an hour's treatment, he said to himself (as I learned six months later): 'So many florins, so many rats'. Little by little he translated into this language the whole complex of money interests which centred round his father's legacy to him, that is to say, all his ideas connected with that subject were, by way of the verbal bridge '*Raten - Ratten*', carried over into his obsessional life and brought under the dominion of his unconscious. Moreover, the captain's request to him to pay back the charges due upon the packet served to strengthen the money significance of rats, by way of another verbal bridge '*Spielratte*', which led back to his father's gambling debt.

¹ See my paper on 'Character and Anal Erotism' (1908*b*).

But the patient was also familiar with the fact that rats are carriers of dangerous infectious diseases; he could therefore employ them as symbols of his dread (justifiable enough in the army) of *syphilitic infection*. This dread concealed all sorts of doubts as to the kind of life his father had led during his term of military service. Again, in another sense, the *penis* itself is a carrier of syphilitic infection; and in this way he could consider the rat as a male organ of sex. It had a further title to be so regarded; for a penis (especially a child's penis) can easily be compared to a *worm*, and the captain's story had been about rats burrowing in some one's anus, just as the large round-worms had in his when he was a child. Thus the penis significance of rats was based, once more, upon anal erotism. And apart from this, the rat is a dirty animal, feeding upon excrement and living in sewers.¹ It is perhaps unnecessary to point out how great an extension of the rat delirium became possible owing to this new meaning. For instance, 'So many rats, so many florins' could serve as an excellent characterization of a certain female profession which he particularly detested. On the other hand, it is certainly not a matter of indifference that the substitution of a penis for a rat in the captain's story resulted in a situation of intercourse *per anum*, which could not fail to be especially revolting to him when brought into connection with his father and the woman he loved. And when we consider that the same situation was reproduced in the compulsive threat which had formed in his mind after the captain had made his request, we shall be forcibly reminded of certain curses in use among the Southern Slavs.² Moreover, all of this material, and more besides, was woven into the fabric of the rat discussions behind the screen-association '*heiraten*' ['to marry'].

¹ If the reader feels tempted to shake his head at the possibility of such leaps of imagination in the neurotic mind, I may remind him that artists have sometimes indulged in similar freaks of fancy. Such, for instance, are Le Poitevin's *Diableries érotiques*.

² The exact terms of these curses will be found in the periodical *Anthropophyteia*, edited by F. S. Krauss.

The story of the rat punishment, as was shown by the patient's own account of the matter and by his facial expression as he repeated the story to me, had fanned into a flame all his prematurely suppressed impulses of cruelty, egoistic and sexual alike. Yet, in spite of all this wealth of material, no light was thrown upon the meaning of his obsessional idea until one day the Rat-Wife in Ibsen's *Little Eyolf* came up in the analysis, and it became impossible to escape the inference that in many of the shapes assumed by his obsessional deliria rats had another meaning still - namely, that of *children*.¹ Enquiry into the origin of this new meaning at once brought me up against some of the earliest and most important roots. Once when the patient was visiting his father's grave he had seen a big beast, which he had taken to be a rat, gliding along over the grave.² He assumed that it had actually come out of his father's grave, and had just been having a meal off his corpse. The notion of a rat is inseparably bound up with the fact that it has sharp teeth with which it gnaws and bites.³ But rats cannot be sharp-toothed, greedy and dirty with impunity: they are cruelly persecuted and mercilessly put to death by man, as the patient had often observed with horror. He had often pitied the poor creatures. But he himself had been just such a nasty, dirty little wretch, who was apt to bite people when he was in a rage, and had been fearfully punished for doing so (p. 2162). He could truly be said to find 'a living likeness of himself' in the rat. It was almost as though Fate, when the captain told him his story, had been putting him through an association test: she had called out a 'complex stimulus-word', and he had reacted to it with his obsessional idea.

¹ Ibsen's Rat-Wife must certainly be derived from the legendary Pied Piper of Hamelin, who first enticed away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat-Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny - as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

² It was no doubt a weasel, of which there are great numbers in the Zentralfriedhof [the principal cemetery] in Vienna.

³ Compare the words of Mephistopheles:

Doch dieser Schwelle Zauber zu zerspalten
Bedarf ich eines Rattenzahns.

.....
Noch einen Biss, so ist's geschehn!

[But to break through the magic of this threshold
I need a rat's tooth. (*He conjures up a rat.*)

.....
Another bite, and it is done!]

According, then, to his earliest and most momentous experiences, rats were children. And at this point he brought out a piece of information which he had kept away from its context long enough, but which now fully explained the interest he was bound to feel in children. The lady, whose admirer he had been for so many years, but whom he had nevertheless not been able to make up his mind to marry, was condemned to childlessness by reason of a gynaecological operation which had involved the removal of both ovaries. This indeed - for he was extraordinarily fond of children - had been the chief reason for his hesitation.

It was only then that it became possible to understand the inexplicable process by which his obsessional idea had been formed. With the assistance of our knowledge of infantile sexual theories and of symbolism (as learnt from the interpretation of dreams) the whole thing could be translated and given a meaning. When, at the afternoon halt (during which he had lost his pince-nez), the captain had told him about the rat punishment, the patient had only been struck at first by the combined cruelty and lasciviousness of the situation depicted. But immediately afterwards a connection had been set up with the scene from his childhood in which he himself had bitten some one. The captain - a man who could defend such punishments - had become a substitute for his father, and had thus drawn down upon himself a part of the reviving animosity which had burst out, on the original occasion, against his cruel father. The idea which came into his consciousness for a moment, to the effect that something of the sort might happen to some one he was fond of, is probably to be translated into a wish such as 'You ought to have the same thing done to you!' aimed at the teller of the story, but through him at his father. A day and a half later,¹ when the captain had handed him the packet upon which the charges were due and had requested him to pay back the 3.80 *kronen* to Lieutenant A., he had already been aware that his 'cruel superior' was making a mistake, and that the only person he owed anything to was the young lady at the post office. It might easily, therefore, have occurred to him to think of some derisive reply, such as, 'Will I, though?' or 'Pay your grandmother!' or 'Yes! You bet I'll pay him back the money!' - answers which would have been subject to no compulsive force. But instead, out of the stirrings of his father-complex and out of his memory of the scene from his childhood, there formed in his mind some such answer as: 'Yes! I'll pay back the money to A. when my father and the lady have children!' or 'As sure as my father and the lady can have children, I'll pay him back the money!' In short, a derisive affirmation attached to an absurd condition which could never be fulfilled.²

¹ Not that evening, as he first told me. It was quite impossible that the pince-nez he had ordered could have arrived the same day. The patient shortened the interval of time retrospectively, because it was the period during which the decisive mental connections had been set up, and during which the repressed episode had taken place - the episode of his interview with the officer who told him of the friendly conduct of the young lady at the post office.

² Thus absurdity signifies derision in the language of obsessional thought, just as it does in dreams. See my *Interpretation of Dreams*.

But now the crime had been committed; he had insulted the two persons who were dearest to him - his father and his lady. The deed had called for punishment, and the penalty had consisted in his binding himself by a vow which it was impossible for him to fulfil and which entailed literal obedience to his superior's ill-founded request. The vow ran as follows: '*Now you must really pay back the money to A.*' In his convulsive obedience he had repressed his better knowledge that the captain's request had been based upon erroneous premises: 'Yes, you must pay back the money to A., as your father's surrogate has required. Your father cannot be mistaken.' So too the king cannot be mistaken; if he addresses one of his subjects by a title which is not his, the subject bears that title ever afterwards.

Only vague intelligence of these events reached the patient's consciousness. But his revolt against the captain's order and the sudden transformation of that revolt into its opposite were both represented there. First had come the idea that he was *not* to pay back the money, or it (that is, the rat punishment) would happen; and then had come the transformation of this idea into a vow to the opposite effect, as a punishment for his revolt.

Let us, further, picture to ourselves the general conditions under which the formation of the patient's great obsessional idea occurred. His libido had been increased by a long period of abstinence coupled with the friendly welcome which a young officer can always reckon upon receiving when he goes among women. Moreover, at the time when he had started for the manoeuvres, there had been a certain coolness between himself and his lady. This intensification of his libido had inclined him to a renewal of his ancient struggle against his father's authority, and he had dared to think of having sexual intercourse with other women. His loyalty to his father's memory had grown weaker, his doubts as to his lady's merits had increased; and in that frame of mind he let himself be dragged into insulting the two of them, and had then punished himself for it. In doing so he had copied an old model. And when at the end of the manoeuvres he had hesitated so long whether he should travel to Vienna or whether he should stop and fulfil his vow, he had represented in a single picture the two conflicts by which he had from the very first been torn - whether or no he should remain obedient to his father and whether or no he should remain faithful to his beloved.¹

¹ It is perhaps not uninteresting to observe that once again obedience to his father coincided with abandoning the lady. If he had stopped and paid back the money to A., he would have made atonement to his father, and at the same time he would have deserted his lady in favour of some one else more attractive. In this conflict the lady had been victorious - with the assistance, to be sure, of the patient's own normal good sense.

I may add a word upon the interpretation of the 'sanction' which, it will be remembered, was to the effect that 'otherwise the rat punishment will be carried out on both of them'. It was based upon the influence of two infantile sexual theories, which I have discussed elsewhere.¹ The first of these theories is that babies come out of the anus; and the second, which follows logically from the first, is that men can have babies just as well as women. According to the technical rules for interpreting dreams, the notion of coming *out of* the rectum can be represented by the opposite notion of creeping *into* the rectum (as in the rat punishment), and *vice versa*.

We should not be justified in expecting such severe obsessional ideas as were present in this case to be cleared up in any simpler manner or by any other means. When we reached the solution that has been described above, the patient's rat delirium disappeared.

¹ 'On the Sexual Theories of Children' (1908c).

II

THEORETICAL

(A) SOME GENERAL CHARACTERISTICS OF OBSESSIONAL STRUCTURES ¹

In the year 1896 I defined obsessional ideas as 'transformed self-reproaches which have re-emerged from repression and which always relate to some sexual act that was performed with pleasure in childhood'. This definition now seems to me to be open to criticism upon formal grounds, though its component elements are unobjectionable. It was aiming too much at unification, and took as its model the practice of obsessional neurotics themselves, when, with their characteristic liking for indeterminateness, they heap together under the name of 'obsessional ideas' the most heterogeneous psychical structures.² In point of fact, it would be more correct to speak of 'obsessive thinking', and to make it clear that obsessional structures can correspond to every sort of psychical act. They can be classed as wishes, temptations, impulses, reflections, doubts, commands, or prohibitions. Patients endeavour in general to tone down such distinctions and to regard what remains of these psychical acts after they have been deprived of their affective index simply as 'obsessional ideas'. Our present patient gave an example of this type of behaviour in one of his first sessions, when he attempted to reduce a wish to the level of a mere 'train of thought' (p. 2144).

¹ Several of the points dealt with in this and the following section have already been mentioned in the literature on the subject of obsessional neuroses, as may be gathered from Löwenfeld's exhaustive study, *Die psychischen Zwangerscheinungen*, 1904, which is the standard work upon this form of disease.

² This fault in my definition is to some extent corrected in the paper itself. The following passage will be found: 'The re-activated memories, however, and the self-reproaches formed from them never re-emerge into consciousness unchanged: what become conscious as obsessional ideas and affects, and take the place of the pathogenic memories so far as conscious life is concerned, are structures in the nature of a compromise between the repressed ideas and the repressing ones.' In the definition, that is to say, especial stress is to be laid on the word 'transformed'.

It must be confessed, moreover, that even the phenomenology of obsessional thinking has not yet had sufficient attention paid to it. During the secondary defensive struggle, which the patient carries on against the 'obsessional ideas' that have forced their way into his consciousness, psychical structures make their appearance which deserve to be given a special name. (Such, for example, were the sequences of thoughts that occupied our patient's mind on his journey back from the manoeuvres.) They are not purely reasonable considerations arising in opposition to the obsessional thoughts, but, as it were, hybrids between the two species of thinking; they accept certain of the premises of the obsession they are combating, and thus, while using the weapons of reason, are established upon a basis of pathological thought. I think such structures as these deserve to be given the name of '*deliria*'. To make the distinction clear, I will give an instance, which should be inserted into its proper context in the patient's case history. I have already described the crazy conduct to which he gave way at one time when he was preparing for an examination - how, after working till far into the night, he used to go and open the front door to his father's ghost, and then look at his genitals in the looking-glass (p. 2160). He tried to bring himself to his senses by asking himself what his father would say to it all if he were really still alive. But the argument had no effect so long as it was put forward in this rational shape. The spectre was not laid until he had transformed the same idea into a 'delirious' threat to the effect that if he ever went through this nonsense again some evil would befall his father in the next world.

The distinction between a primary and a secondary defensive struggle is no doubt well founded, but we find its value unexpectedly diminished when we discover that *the patients themselves do not know the wording of their own obsessional ideas*. This may sound paradoxical, but it is perfectly good sense. During the progress of a psycho-analysis it is not only the patient who plucks up courage, but his disease as well; it grows bold enough to speak more plainly than before. To drop the metaphor, what happens is that the patient, who his hitherto turned his eyes away in terror from his own pathological productions, begins to attend to them and obtains a clearer and more detailed view of them.¹

There are, besides this, two special ways in which a more precise knowledge of obsessional structures can be gained. In the first place, experience shows that an obsessional command (or whatever it may be), which in waking life is known only in a truncated and distorted form, like a mutilated telegraph message, may have its actual text brought to light in a dream. Such texts appear in dreams in the shape of speeches, and are thus an exception to the rule that speeches in dreams are derived from speeches in real life.² Secondly, in the course of the analytic examination of a case history, one becomes convinced that if a number of obsessions succeed one another they are often - even though their wording is not identical - ultimately one and the same. The obsession may have been successfully shaken off on its first appearance, but it comes back a second time in a distorted form and without being recognized, and may then perhaps be able to hold its own in the defensive struggle more effectively, precisely because of its distortion. But the original form is the correct one, and often displays its meaning quite openly. When we have at great pains elucidated an unintelligible obsessional idea, it often happens that the patient informs us that just such a notion, wish, or temptation as the one we have constructed did in fact make its appearance on one occasion before the obsessional idea had arisen, but that it did not persist. It would unfortunately involve us in too lengthy a digression if we were to give instances of this from the history of our present patient.

¹ Some patients carry the diversion of their attention to such lengths that they are totally unable to give the content of an obsessional idea or to describe an obsessional act though they have performed it over and over again.

² See *The Interpretation of Dreams*, 1900a, Chapter VI, Section F.

What is officially described as an 'obsessional idea' exhibits, therefore, in its distortion from its original wording, traces of the primary defensive struggle. Its distortion enables it to persist, since conscious thought is thus compelled to misapprehend it, just as though it were a dream; for dreams also are a product of compromise and distortion, and are also misapprehended by waking thought.

This misapprehension on the part of consciousness can be seen at work not only in reference to the obsessional ideas themselves, but also in reference to the products of the secondary defensive struggle, such, for instance, as the protective formulas. I can produce two good examples of this. Our patient used to employ as a defensive formula a rapidly pronounced '*aber*' ['but'] accompanied by a gesture of repudiation. He told me on one occasion that this formula had become altered recently; he now no longer said '*áber*' but '*abér*'. When he was asked to give the reason for this new departure, he declared that the mute '*e*' of the second syllable gave him no sense of security against the intrusion, which he so much dreaded, of some foreign and contradictory element, and that he had therefore decided to accent the '*e*'. This explanation (an excellent sample of the obsessional neurotic style) was, however, clearly inadequate; the most that it could claim to be was a rationalization. The truth was that '*abér*' was an approximation towards the similar-sounding '*abwehr*' ['defence'], a term which he had learnt in the course of our theoretical discussions of psycho-analysis. He had thus put the treatment to an illegitimate and 'delirious' use in order to strengthen a defensive formula. Another time he told me about his principal magic word, which was an apotropaic against every evil; he had put it together out of the initial letters of the most powerfully beneficent of his prayers and had clapped on an 'amen' at the end of it. I cannot reproduce the word itself, for reasons which will become apparent immediately. For, when he told it me, I could not help noticing that the word was in fact an anagram of the name of his lady. Her name contained an '*s*', and this he had put last, that is, immediately before the 'amen' at the end. We may say, therefore, that by this process he had brought his '*Samen*' ['semen'] into contact with the woman he loved; in imagination, that is to say, he had masturbated with her. He himself, however, had never noticed this very obvious connection; his defensive forces had allowed themselves to be fooled by the repressed ones. This is also a good example of the rule that in time the thing which is meant to be warded off invariably finds its way into the very means which is being used for warding it off.

I have already asserted that obsessional thoughts have undergone a distortion similar to that undergone by dream-thoughts before they become the manifest content of a dream. The technique of this distortion may therefore be of interest to us, and there should be nothing to prevent our exhibiting its various modes by means of a series of obsessions which have been translated and made clear. But here again the conditions governing the publication of this case make it impossible for me to give more than a few specimens. Not all of the patient's obsessions were so complicated in their structure and so difficult to solve as the great rat idea. In some of the others a very simple technique was employed - namely, that of distortion by omission or ellipsis. This technique is pre-eminently applicable to jokes, but in our present case, too, it did useful work as a means of protecting things from being understood.

For instance, one of the patient's oldest and favourite obsessions (which corresponded to an admonition or warning) ran as follows: '*If I marry the lady, some misfortune will befall my father (in the next world).*' If we insert the intermediate steps, which had been skipped but were known to us from the analysis, we get the following train of thought: 'If my father were alive, he would be as furious over my design of marrying the lady as he was in the scene in my childhood; so that I should fly into a rage with him once more and wish him every possible evil; and thanks to the omnipotence of my wishes¹ these evils would be bound to come upon him.'

Here is another instance in which a solution can be reached by filling out an ellipsis. It is once more in the nature of a warning or an ascetic prohibition. The patient had a charming little niece of whom he was very fond. One day this idea came into his head: '*If you indulge in intercourse, something will happen to Ella*' (i.e. she will die). When the omissions have been made good, we have: 'Every time you copulate, even with a stranger, you will not be able to avoid the reflection that in your married life sexual intercourse can never bring you a child (on account of the lady's sterility). This will grieve you so much that you will become envious of your sister on account of little Ella, and you will grudge her the child. These envious impulses will inevitably lead to the child's death.'²

¹ This omnipotence is discussed further on.

² An example from another of my works, *Jokes and their Relation to the Unconscious*, will recall to the reader the manner in which this elliptical technique is employed in making jokes: 'There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: "If X hears of this, he'll get his ears boxed again." . . . The apparent absurdity of this remark disappears if between the two clauses we insert the words: "he'll write such a scathing article upon the man, that, etc." - This elliptical joke, we may note, is similar in its content, as well as in its form, to the first example quoted in the text.

The technique of distortion by ellipsis seems to be typical of obsessional neuroses; I have come across it in the obsessional thoughts of other patients as well. One example, a particularly transparent one, is of especial interest on account of a certain structural similarity with the rat idea. It was a case of doubting, and occurred in a lady who suffers principally from obsessional *acts*. This lady was going for a walk with her husband in Nuremberg, and made him take her into a shop, where she purchased various objects for her child and amongst them a comb. Her husband, finding that the shopping was too long a business for his taste, said that he had noticed some coins in an antique shop on the way which he was anxious to secure, adding that after he had made his purchase he would come and fetch her in the shop in which they at present were. But he stayed away, as she thought, far too long. When he came back she accordingly asked him where he had been. 'Why,' he replied, 'at the antique shop I told you about.' At the same instant she was seized by a tormenting doubt whether she had not as a matter of fact always possessed the comb which she had just bought for her child. She was naturally quite unable to discover the simple mental link that was involved. There is nothing for it but to regard the doubt as having become displaced, and to reconstruct the complete chain of unconscious thoughts as follows: 'If it is true that you were only at the antique shop, if I am really to believe that, then I may just as well believe that this comb that I bought a moment ago has been in my possession for years.' Here, therefore, the lady was drawing a derisive and ironical parallel, just as when our patient thought: 'Oh yes, as sure as those two' (his father and the lady) 'will have children, I shall pay back the money to A.' In the lady's case the doubt was dependent upon her unconscious jealousy, which led her to suppose that her husband had spent the interval of his absence in paying a visit of gallantry.

I shall not in the present paper attempt any discussion of the *psychological* significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of *requiring* it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will only add here that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.

(B) SOME PSYCHOLOGICAL PECULIARITIES OF OBSESSIONAL NEUROTICS:
THEIR ATTITUDE TOWARD REALITY, SUPERSTITION AND DEATH

In this section I intend to deal with a few mental characteristics of obsessional neurotics which, though they do not seem important in themselves, nevertheless lie upon the road to a comprehension of more important things. They were strongly marked in our present patient; but I know that they are not attributable to his individual character, but to his disorder, and that they are to be met with quite typically in other obsessional patients.

Our patient was to a high degree superstitious, and this although he was a highly educated and enlightened man of considerable acumen, and although he was able at times to assure me that he did not believe a word of all this rubbish. Thus he was at once superstitious and not superstitious; and there was a clear distinction between his attitude and the superstition of uneducated people who feel themselves at one with their belief. He seemed to understand that his superstition was dependent upon his obsessional thinking, although at times he gave way to it completely. The meaning of this inconsistent and vacillating behaviour can be most easily, grasped if it is regarded in the light of a hypothesis which I shall now proceed to mention. I did not hesitate to assume that the truth was not that the patient still had an open mind upon this subject, but that he had two separate and contradictory convictions upon it. His oscillation between these two views quite obviously depended upon his momentary attitude towards his obsessional disorder. As soon as he had got the better of one of these obsessions, he used to smile in a superior way at his own credulity, and no events then occurred that were calculated to shake his firmness; but the moment he came under the sway of another obsession which had not been cleared up - or, what amounts to the same thing, of a resistance - the strangest coincidences would happen, to support him in his credulous belief.

His superstition was nevertheless that of an educated man, and he avoided such vulgar prejudices as being afraid of Friday or of the number thirteen, and so on. But he believed in premonitions and in prophetic dreams; he would constantly meet the very person of whom, for some inexplicable reason, he had just been thinking; or he would receive a letter from some one who had suddenly come into his mind after being forgotten for many years. At the same time he was honest enough - or rather, he was loyal enough to his official conviction - not to have forgotten instances in which the strangest forebodings had come to nothing. On one occasion, for instance, when he went away for his summer holidays, he had felt morally certain that he would never return to Vienna alive. He also admitted that the great majority of his premonitions related to things which had no special personal importance to him, and that, when he met an acquaintance of whom, until a few moments previously, he had not thought for a very long time, nothing further took place between himself and the miraculous apparition. And he naturally could not deny that all the important events of his life had occurred without his having had any premonition of them, and that, for instance, his father's death had taken him entirely by surprise. But arguments such as these had no effect upon the discrepancy in his convictions. They merely served to prove the obsessional nature of his superstitions, and that could already be inferred from the way in which they came and went with the increase and decrease of his resistance.

I was not in a position, of course, to give a rational explanation of all the miraculous stories of his remoter past. But as regards the similar things that happened during the time of his treatment, I was able to prove to him that he himself invariably had a hand in the manufacture of these miracles, and I was able to point out to him the methods that he employed. He worked by means of peripheral vision and reading, forgetting, and, above all, errors of memory. In the end he used himself to help me in discovering the little sleight-of-hand tricks by which these wonders were performed. I may mention one interesting infantile root of his belief that forebodings and premonitions came true. It was brought to light by his recollection that very often, when a date was being fixed for something, his mother used to say: 'I shan't be able to on such-and-such a day. I shall have to stop in bed then.' And in fact when the day in question arrived she had invariably stayed in bed!

There can be no doubt that the patient felt a need for finding experiences of this kind to act as props for his superstition, and that it was for that reason that he occupied himself so much with the inexplicable coincidences of everyday life with which we are all familiar, and helped out their shortcomings with unconscious activity of his own. I have come across a similar need in many other obsessional patients and have suspected its presence in many more besides. It seems to me easily explicable in view of the psychological characteristics of the obsessional neurosis. In this disorder, as I have already explained (p. 2155), repression is effected not by means of amnesia but by a severance of causal connections brought about by a withdrawal of affect. These repressed connections appear to persist in some kind of shadowy form (which I have elsewhere compared to an endopsychic perception),¹ and they are thus transferred, by a process of projection, into the external world, where they bear witness to what has been effaced from consciousness.

¹ *The Psychopathology of Everyday Life* (1901b), Chapter XII, Section C (b).

Another mental need, which is also shared by obsessional neurotics and which is in some respects related to the one just mentioned, is the need for *uncertainty* in their life, or for *doubt*. An enquiry into this characteristic leads deep into the investigation of instinct. The creation of uncertainty is one of the methods employed by the neurosis for drawing the patient away from *reality* and isolating him from the world - which is among the objects of every psychoneurotic disorder. Again, it is only too obvious what efforts are made by the patients themselves in order to be able to avoid certainty and remain in doubt. Some of them, indeed, give a vivid expression to this tendency in a dislike of clocks and watches (for these at least make the time of day certain), and in the unconscious artifices which they employ in order to render these doubt removing instruments innocuous. Our present patient had developed a peculiar talent for avoiding a knowledge of any facts which would have helped him in deciding his conflict. Thus he was in ignorance upon those matters relating to his lady which were the most relevant to the question of his marriage: he was ostensibly unable to say who had operated upon her and whether the operation had been unilateral or bilateral. He had to be forced into remembering what he had forgotten and into finding out what he had overlooked.

The predilection felt by obsessional neurotics for uncertainty and doubt leads them to turn their thoughts by preference to those subjects upon which all mankind are uncertain and upon which our knowledge and judgements must necessarily remain open to doubt. The chief subjects of this kind are paternity, length of life, life after death, and memory - in the last of which we are all in the habit of believing, without having the slightest guarantee of its trustworthiness.¹

¹ As Lichtenberg says, 'An astronomer knows whether the moon is inhabited or not with about as much certainty as he knows who was his father, but not with so much certainty as he knows who was his mother'. A great advance was made in civilization when men decided to put their inferences upon a level with the testimony of their senses and to make the step from matriarchy to patriarchy. The prehistoric figures which show a smaller person sitting upon the head of a larger one are representations of patrilineal descent; Athena had no mother, but sprang from the head of Zeus. A witness who testifies to something before a court of law is still called '*Zeuge*' [literally, 'begetter'] in German, after the part played by the male in the act of procreation; so too in hieroglyphics the word for a 'witness' is written with a representation of the male organ.

In obsessional neuroses the uncertainty of memory is used to the fullest extent as a help in the formation of symptoms; and we shall learn directly the part played in the actual content of the patients' thoughts by the questions of length of life and life after death. But as an appropriate transition I will first consider one particular superstitious trait in our patient to which I have already alluded (p. 2176) and which will no doubt have puzzled more than one of my readers.

I refer to the *omnipotence* which he ascribed to his thoughts and feelings, and to his wishes, whether good or evil. It is, I must admit, decidedly tempting to declare that this idea was a delusion and that it oversteps the limits of obsessional neurosis. I have, however, come across the same conviction in another obsessional patient; and he was long ago restored to health and is leading a normal life. Indeed, all obsessional neurotics behave as though they shared this conviction. It will be our business to throw some light upon these patients' over-estimation of their powers. Assuming, without more ado, that this belief is a frank acknowledgement of a relic of the old megalomania of infancy, we will proceed to ask our patient for the grounds of his conviction. In reply, he adduces two experiences. When he returned for a second visit to the hydropathic establishment at which his disorder had been relieved for the first and only time, he asked to be given his old room, for its position had facilitated his relations with one of the nurses. He was told that the room was already taken and that it was occupied by an old professor. This piece of news considerably diminished his prospects of successful treatment, and he reacted to it with the unamiable thought: 'I wish he may be struck dead for it!' A fortnight later he was woken up from his sleep by the disturbing idea of a corpse; and in the morning he heard that the professor had really had a stroke, and that he had been carried up into his room at about the time he himself had woken up. The second experience related to an unmarried woman, no longer young, though with a great desire to be loved, who had paid him a great deal of attention and had once asked him point blank whether he could not love her. He had given her an evasive answer. A few days afterwards he heard that she had thrown herself out of a window. He then began to reproach himself, and said to himself that it would have been in his power to save her life by giving her his love. In this way he became convinced of the omnipotence of his love and of his hatred. Without denying the omnipotence of love we may point out that both these instances were concerned with death, and we may adopt the obvious explanation that, like other obsessional neurotics, our patient was compelled to overestimate the effects of his hostile feelings upon the external world, because a large part of their internal, mental effects escaped his conscious knowledge. His love - or rather his hatred - was in truth overpowering; it was precisely they that created the obsessional thoughts, of which he could not understand the origin and against which he strove in vain to defend himself.¹

¹ [Footnote added 1923:] The omnipotence of thoughts, or, more accurately speaking, of wishes, has since been recognized as an essential element in the mental life of primitive people. See *Totem and Taboo* (1912-13).

Our patient had a quite peculiar attitude towards the question of death. He showed the deepest sympathy whenever any one died, and religiously attended the funeral; so that among his brothers and sisters he earned the nickname of 'carrion crow'. In his imagination, too, he was constantly making away with people so as to show his heartfelt sympathy for their bereaved relatives. The death of an elder sister, which took place when he was between three and four years old, played a great part in his phantasies, and was brought into intimate connection with his childish misdemeanours during the same period. We know, moreover, at what an early age thoughts about his father's death had occupied his mind, and we may regard his illness itself as a reaction to that event, for which he had felt an obsessional wish fifteen years earlier. The strange extension of his obsessional fears to the 'next world' was nothing else than a compensation for these death-wishes which he had felt against his father. It was introduced eighteen months after his father had died, at a time when there had been a revival of his sorrow at the loss, and it was designed - in defiance of reality, and in deference to the wish which had previously been showing itself in phantasies of every kind - were intended to undo the fact of his father's death. We have had occasion in several places (pp. 2173, and 2176) to translate the phrase 'in the next world' by the words 'if my father were still alive'.

But the behaviour of other obsessional neurotics does not differ greatly from that of our present patient, even though it has not been their fate to come face to face with the phenomenon of death at such an early age. Their thoughts are unceasingly occupied with other people's length of life and possibility of death; their superstitious propensities have had no other content to begin with, and have perhaps no other source whatever. But these neurotics need the help of the possibility of death chiefly in order that it may act as a solution of conflicts they have left unsolved. Their essential characteristic is that they are incapable of coming to a decision, especially in matters of love; they endeavour to postpone every decision, and, in their doubt which person they shall decide for or what measures they shall take against a person, they are obliged to choose as their model the old German courts of justice, in which the suits were usually brought to an end, before judgement had been given, by the death of the parties to the dispute. Thus in every conflict which enters their lives they are on the look out for the death of some one who is of importance to them, usually of some one they love - such as one of their parents, or a rival, or one of the objects of their love between which their inclinations are wavering. But at this point our discussion of the death-complex in obsessional neuroses touches upon the problem of the instinctual life of obsessional neurotics. And to this problem we must now turn.

(C) THE INSTINCTUAL LIFE OF OBSESSIONAL NEUROTICS,
AND THE ORIGINS OF COMPULSION AND DOUBT

If we wish to obtain a grasp of the psychical forces whose interplay built up this neurosis, we must turn back to what we have learnt from the patient on the subject of the precipitating causes of his falling ill as a grown-up man and as a child. He fell ill when he was in his twenties on being faced with a temptation to marry another woman instead of the one whom he had loved so long; and he avoided a decision of this conflict by postponing all the necessary preliminary actions. The means for doing this was given him by his neurosis. His hesitation between the lady he loved and the other girl can be reduced to a conflict between his father's influence and his love for his lady, or, in other words, to a conflicting choice between his father and his sexual object, such as had already subsisted (judging from his recollections and obsessional ideas) in his remote childhood. All through his life, moreover, he was unmistakably victim to a conflict between love and hatred, in regard both to his lady and to his father. His phantasies of revenge and such obsessional phenomena as his obsession for understanding and his exploit with the stone in the road bore witness to his divided feelings; and they were to a certain degree comprehensible and normal, for the lady by her original refusal and subsequently by her coolness had given him some excuse for hostility. But his relations with his father were dominated by a similar division of feeling, as we have seen from our translation of his obsessional thoughts; and his father, too, must have given him an excuse for hostility in his childhood, as indeed we have been able to establish almost beyond question. His attitude towards the lady - a compound of tenderness and hostility - came to a great extent within the scope of his conscious knowledge; at most he deceived himself over the degree and violence of his negative feelings. But his hostility towards his father, on the contrary, though he had once been acutely conscious of it, had long since vanished from his ken, and it was only in the teeth of the most violent resistance that it could be brought back into his consciousness. We may regard the repression of his infantile hatred of his father as the event which brought his whole subsequent career under the dominion of the neurosis.

The conflicts of feeling in our patient which we have here enumerated separately were not independent of each other, but were bound together in pairs. His hatred of his lady was inevitably coupled with his attachment to his father, and inversely his hatred of his father with his attachment to his lady. But the two conflicts of feeling which result from this simplification - namely, the opposition between his relation to his father and to his lady, and the contradiction between his love and his hatred within each of these relations - had no connection whatever with each other, either in their content or in their origin. The first of these two conflicts corresponds to the normal vacillation between male and female which characterizes every one's choice of a love-object. It is first brought to the child's notice by the time-honoured question: 'Which do you love most, Daddy or Mummy?' and it accompanies him through his whole life, whatever may be the relative intensity of his feelings to the two sexes or whatever may be the sexual aim upon which he finally becomes fixed. But normally this opposition soon loses the character of a hard-and-fast contradiction, of an inexorable 'either-or'. Room is found for satisfying the unequal demands of both sides, although even in a normal person the higher estimation of one sex is always thrown into relief by a depreciation of the other.

The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the *chronic* co-existence of love and hatred, both directed towards the same person and both of the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the co-operation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person's erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.¹

¹ Compare the discussion on this point during one of the first sessions. - (*Added 1923:*) Bleuler subsequently introduced the appropriate term 'ambivalence' to describe this emotional constellation. See also a further development of this line of thought in my paper 'The Predisposition to Obsessional Neurosis' (1913/).

If we consider a number of analyses of obsessional neurotics we shall find it impossible to escape the impression that a relation between love and hatred such as we have found in our present patient is among the most frequent, the most marked, and probably, therefore, the most important characteristics of obsessional neurosis. But however tempting it may be to bring the problem of the 'choice of neurosis' into connection with instinctual life, there are reasons enough for avoiding such a course. For we must remember that in every neurosis we come upon the same suppressed instincts behind the symptoms. After all, hatred, kept suppressed in the unconscious by love, plays a great part in the pathogenesis of hysteria and paranoia. We know too little of the nature of love to be able to arrive at any definite conclusion here; and, in particular, the relation between the *negative* factor¹ in love and the sadistic components of the libido remains completely obscure. What follows is therefore to be regarded as no more than a provisional explanation. We may suppose, then, that in the cases of unconscious hatred with which we are concerned the sadistic components of love have, from constitutional causes, been exceptionally strongly developed, and have consequently undergone a premature and all too thorough suppression, and that the neurotic phenomena we have observed arise on the one hand from conscious feelings of affection which have become exaggerated as a reaction, and on the other hand from sadism persisting in the unconscious in the form of hatred.

¹ Alcibiades says of Socrates in the *Symposium*: 'Many a time have I wished that he were dead, and yet I know that I should be much more sorry than glad if he were to die: so that I am at my wits' end.'

But in whatever way this remarkable relation of love and hatred is to be explained, its occurrence is established beyond any possibility of doubt by the observations made in the present case; and it is gratifying to find how easily we can now follow the puzzling processes of an obsessional neurosis by bringing them into relation with this one factor. If an intense love is opposed by an almost equally powerful hatred, and is at the same time inseparably bound up with it, the immediate consequence is certain to be a partial paralysis of the will and an incapacity for coming to a decision upon any of those actions for which love ought to provide the motive power. But this indecision will not confine itself for long to a single group of actions. For, in the first place, what actions of a lover are not brought into relation with his one principal motive? And secondly a man's attitude in sexual things has the force of a model to which the rest of his reactions tend to conform. And thirdly, it is an inherent characteristic in the psychology of an obsessional neurotic to make the fullest possible use of the mechanism of *displacement*. So the paralysis of his powers of decision gradually extends itself over the entire field of the patient's behaviour.

And here we have the domination of *compulsion* and *doubt* such as we meet with in the mental life of obsessional neurotics.

The *doubt* corresponds to the patient's internal perception of his own indecision, which, in consequence of the inhibition of his love by his hatred, takes possession of him in the face of every intended action. The doubt is in reality a doubt of his own love - which ought to be the most certain thing in his whole mind; and it becomes diffused over everything else, and is especially apt to become displaced on to what is most insignificant and small.¹ A man who doubts his own love may, or rather *must*, doubt every lesser thing.²

¹ Compare the use of 'representation by something very small' as a technique in making jokes. Cf. *Jokes and their Relation to the Unconscious*.

² So in the love-verses addressed by Hamlet to Ophelia:

Doubt thou the stars are fire;
Doubt that the sun doth move;
Doubt truth to be a liar;
But never doubt I love.

It is this same doubt that leads the patient to uncertainty about his protective measures, and to his continual repetition of them in order to banish that uncertainty; and it is this doubt, too, that eventually brings it about that the patient's protective acts themselves become as impossible to carry out as his original inhibited decision in connection with his love. At the beginning of my investigations I was led to assume another and more general origin for the uncertainty of obsessional neurotics and one which seemed to be nearer the normal. If, for instance, while I am writing a letter some one interrupts me with questions, I afterwards feel a quite justifiable uncertainty as to what I may not have written under the influence of the disturbance, and, to make sure, I am obliged to read the letter over after I have finished it. In the same way I might suppose that the uncertainty of obsessional neurotics, when they are praying, for instance, is due to unconscious phantasies constantly mingling with their prayers and disturbing them. This hypothesis is correct, but it may be easily reconciled with what I have just said. It is true that the patient's uncertainty whether he has carried through a protective measure is due to the disturbing effect of unconscious phantasies; but the content of these phantasies is precisely the contrary impulse - which it was the very aim of the prayer to ward off. This became clearly evident in our patient on one occasion, for the disturbing element did not remain unconscious but made its appearance openly. The words he wanted to use in his prayer were, '*May God protect her*', but a hostile '*not*' suddenly darted out of his unconscious and inserted itself into the sentence; and he understood that this was an attempt at a curse (p. 2152). If the '*not*' had remained mute, he would have found himself in a state of uncertainty and would have kept on prolonging his prayers indefinitely. But since it became articulate he eventually gave up praying. Before doing so, however, he, like other obsessional patients, tried every kind of method for preventing the opposite feeling from insinuating itself. He shortened his prayers, for instance, or said them more rapidly. And similarly other patients will endeavour to '*isolate*' all such protective acts from other things. But none of these technical procedures are of any avail in the long run. If the impulse of love achieves any success by displacing itself on to some trivial act, the impulse of hostility will very soon follow it on to its new ground and once more proceed to undo all that it has done.

And when the obsessional patient lays his finger on the weak spot in the security of our mental life - on the untrustworthiness of our memory - the discovery enables him to extend his doubt over everything, even over actions which have already been performed and which have so far had no connection with the love-hatred complex, and over the entire past. I may recall the instance of the woman who had just bought a comb for her little daughter in a shop, and, becoming suspicious of her husband, began to doubt whether she had not as a matter of fact been in possession of the comb for a long time. Was not this woman saying point-blank: 'If I can doubt your love' (and this was only a projection of her doubt of her own love for him), 'then I can doubt this too, then I can doubt everything' - thus revealing to us the hidden meaning of neurotic doubt?

The *compulsion* on the other hand is an attempt at a compensation for the doubt and at a correction of the intolerable conditions of inhibition to which the doubt bears witness. If the patient, by the help of displacement, succeeds at last in bringing one of his inhibited intentions to a decision, then the intention *must* be carried out. It is true that this intention is not his original one, but the energy dammed up in the latter cannot let slip the opportunity of finding an outlet for its discharge in the substitutive act. Thus this energy makes itself felt now in commands and now in prohibitions, according as the affectionate impulse or the hostile one snatches control of the pathway leading to discharge. If it happens that a compulsive command cannot be obeyed, the tension becomes intolerable and is perceived by the patient in the form of extreme anxiety. (But the pathway leading to a substitutive act, even where the displacement has been on to something very small, is so hotly contested, that such an act can as a rule be carried out only in the shape of a protective measure intimately associated with the very impulse which it is designed to ward off.

Furthermore, by a sort of *regression*, preparatory acts become substituted for the final decision, thinking replaces acting, and, instead of the substitutive act, some thought preliminary to it asserts itself with all the force of compulsion. According as this regression from acting to thinking is more or less marked, a case of obsessional neurosis will exhibit the characteristics of obsessive thinking (that is, of obsessional ideas) or of obsessive acting in the narrower sense of the word. True obsessional acts such as these, however, are only made possible because they constitute a kind of reconciliation, in the shape of a compromise, between the two antagonistic impulses. For obsessional acts tend to approximate more and more - and the longer the disorder lasts the more evident does this become - to infantile sexual acts of a masturbatory character. Thus in this form of the neurosis acts of love are carried out in spite of everything, but only by the aid of a new kind of regression; for such acts no longer relate to another person, the object of love and hatred, but are auto-erotic acts such as occur in infancy.

The first kind of regression, that from acting to thinking, is facilitated by another factor concerned in the production of the neurosis. The histories of obsessional patients almost invariably reveal an early development and premature repression of the sexual instinct of looking and knowing; and, as we know, a part of the infantile sexual activity of our present patient was governed by that instinct.¹

We have already mentioned the important part played by the sadistic instinctual components in the genesis of obsessional neuroses. Where the epistemophilic instinct is a preponderant feature in the constitution of an obsessional patient, brooding becomes the principal symptom of the neurosis. The thought-process itself becomes sexualized, for the sexual pleasure which is normally attached to the content of thought becomes shifted on to the act of thinking itself, and the satisfaction derived from reaching the conclusion of a line of thought is experienced as a *sexual* satisfaction. In the various forms of obsessional neurosis in which the epistemophilic instinct plays a part, its relation to thought-processes makes it particularly well adapted to attract the energy which is vainly endeavouring to make its way forward into action, and divert it into the sphere of thought, where there is a possibility of its obtaining pleasurable satisfaction of another sort. In this way, with the help of the epistemophilic instinct, the substitutive act may in its turn be replaced by preparatory acts of thought. But procrastination in *action* is soon replaced by lingering over *thoughts*, and eventually the whole process, together with all its peculiarities, is transferred into the new sphere, just as in America an entire house will sometimes be shifted from one site to another.

¹ The very high average of intellectual capacity among obsessional patients is probably also connected with this fact.

I may now venture, upon the basis of the preceding discussion, to determine the psychological characteristic, so long sought after, which lends to the products of an obsessional neurosis their 'obsessive' or compulsive quality. A thought-process is obsessive or compulsive when, in consequence of an inhibition (due to a conflict of opposing impulses) at the motor end of the psychical system, it is undertaken with an expenditure of energy which (as regards both quality and quantity) is normally reserved for actions alone; or, in other words, *an obsessive or compulsive thought is one whose function it is to represent an act regressively*. No one, I think, will question my assumption that processes of thought are ordinarily conducted (on grounds of economy) with smaller displacements of energy, probably at a higher level, than are acts intended to bring about discharge or to modify the external world.

The obsessive thought which has forced its way into consciousness with such excessive violence has next to be secured against the efforts made by conscious thought to resolve it. As we already know, this protection is afforded by the *distortion* which the obsessive thought has undergone before becoming conscious. But this is not the only means employed. In addition, each separate obsessional idea is almost invariably removed from the situation in which it originated and in which, in spite of its distortion, it would be most easily comprehensible. With this end in view, in the first place *an interval of time is inserted* between the pathogenic situation and the obsession that arises from it, so as to lead astray any conscious investigation of its causal connections, and in the second place the content of the obsession is taken out of its particular setting by being *generalized*. Our patient's 'obsession for understanding' is an example of this (p. 2150). But perhaps a better one is afforded by another patient. This was a woman who prohibited herself from wearing any sort of personal adornment, though the exciting cause of the prohibition related only to one particular piece of jewellery: she had envied her mother the possession of it and had had hopes that one day she would inherit it. Finally, if we care to distinguish verbal distortion from distortion of content, there is yet another means by which the obsession is protected against conscious attempts at solution. And that is the choice of an indefinite or ambiguous wording. After being misunderstood, the wording may find its way into the patient's 'deliria', and whatever further processes of development or substitution his obsession undergoes will then be based upon the misunderstanding and not upon the proper sense of the text. Observation will show, however, that the deliria constantly tend to form new connections with that part of the matter and wording of the obsession which is not present in consciousness.

I should like to go back once more to the instinctual life of obsessional neurotics and add one more remark upon it. It turned out that our patient, besides all his other characteristics, was a *renifleur*. By his own account, when he was a child he had recognized every one by their smell, like a dog; and even when he was grown up he was more susceptible to sensations of smell than most people.¹ I have met with the same characteristic in other neurotics, both in hysterical and in obsessional patients, and I have come to recognize that a tendency to taking pleasure in smell, which has become extinct since childhood, may play a part in the genesis of neurosis.² And here I should like to raise the general question whether the atrophy of the sense of smell (which was an inevitable result of man's assumption of an erect posture) and the consequent organic repression of his pleasure in smell may not have had a considerable share in the origin of his susceptibility to nervous disease. This would afford us some explanation of why, with the advance of civilization, it is precisely the sexual life that must fall a victim to repression. For we have long known the intimate connection in the animal organization between the sexual instinct and the function of the olfactory organ.

¹ I may add that in his childhood he had been subject to strong coprophilic propensities. In this connection his anal erotism has already been noticed (p. 2166).

² For instance, in certain forms of fetishism.

In bringing this paper to a close I may express a hope that, though my communication is incomplete in every sense, it may at least stimulate other workers to throw more light upon the obsessional neurosis by a deeper investigation of the subject. What is characteristic of this neurosis - what differentiates it from hysteria - is not, in my opinion, to be found in instinctual life but in the psychological field. I cannot take leave of my patient without putting on paper my impression that he had, as it were, disintegrated into three personalities: into one unconscious personality, that is to say, and into two preconscious ones between which his consciousness could oscillate. His unconscious comprised those of his impulses which had been suppressed at an early age and which might be described as passionate and evil impulses. In his normal state he was kind, cheerful, and sensible - an enlightened and superior kind of person - while in his third psychological organization he paid homage to superstition and asceticism. Thus he was able to have two different creeds and two different outlooks upon life. This second preconscious personality comprised chiefly the reaction-formations against his repressed wishes, and it was easy to foresee that it would have swallowed up the normal personality if the illness had lasted much longer. I have at present an opportunity of studying a lady suffering severely from obsessional acts. She has become similarly disintegrated into an easy-going and lively personality and into an exceedingly gloomy and ascetic one. She puts forward the first of them as her official ego, while in fact she is dominated by the second. Both of these psychical organizations have access to her consciousness, but behind her ascetic personality may be discerned the unconscious part of her being - quite unknown to her and composed of ancient and long-repressed wishful impulses.¹

¹ (*Footnote added 1923:*) The patient's mental health was restored to him by the analysis which I have reported upon in these pages. Like so many other young men of value and promise, he perished in the Great War.

DR. G. STANLEY HALL, PH.D., LL.D.

President of Clark University

Professor of Psychology and Pedagogics

This Work is Gratefully Dedicated

FIRST LECTURE

LADIES AND GENTLEMEN, - It is with novel and bewildering feelings that I find myself in the New World, lecturing before an audience of expectant enquirers. No doubt I owe this honour only to the fact that my name is linked with the topic of psycho-analysis; and it is of psycho-analysis, therefore, that I intend to speak to you. I shall attempt to give you, as succinctly as possible, a survey of the history and subsequent development of this new method of examination and treatment.

If it is a merit to have brought psycho-analysis into being that merit is not mine.¹ I had no share in its earliest beginnings. I was a student and working for my final examinations at the time when another Viennese physician, Dr. Josef Breuer,² first (in 1880-2) made use of this procedure on a girl who was suffering from hysteria. Let us turn our attention straightaway to the history of this case and its treatment, which you will find set out in detail in the *Studies on Hysteria*³ which were published later by Breuer and myself.

But I should like to make one preliminary remark. It is not without satisfaction that I have learnt that the majority of my audience are not members of the medical profession. You have no need to be afraid that any special medical knowledge will be required for following what I have to say. It is true that we shall go along with the doctors on the first stage of our journey, but we shall soon part company with them and, with Dr. Breuer, shall pursue a quite individual path.

¹ [Footnote added 1923:] See, however, in this connection my remarks in 'A History of the Psycho-Analytic Movement' (1914*d*), where I assumed the entire responsibility for psycho-analysis.

² Dr. Josef Breuer, born in 1842, a Corresponding Member of the Kaiserliche Akademie der Wissenschaften, is well known for his work on respiration and on the physiology of the sense of equilibrium.

³ Some of my contributions to this book have been translated into English by Dr. A. A. Brill of New York: *Selected Papers on Hysteria* (New York, 1909).

Dr. Breuer's patient was a girl of twenty-one, of high intellectual gifts. Her illness lasted for over two years, and in the course of it she developed a series of physical and psychological disturbances which decidedly deserved to be taken seriously. She suffered from a rigid paralysis, accompanied by loss of sensation, of both extremities on the right side of her body; and the same trouble from time to time affected her on her left side. Her eye movements were disturbed and her power of vision was subject to numerous restrictions. She had difficulties over the posture of her head; she had a severe nervous cough. She had an aversion to taking nourishment, and on one occasion she was for several weeks unable to drink in spite of a tormenting thirst. Her powers of speech were reduced, even to the point of her being unable to speak or understand her native language. Finally, she was subject to conditions of '*absence*',¹ of confusion, of delirium, and of alteration of her whole personality, to which we shall have presently to turn our attention.

When you hear such an enumeration of symptoms, you will be inclined to think it safe to assume, even though you are not doctors, that what we have before us is a severe illness, probably affecting the brain, that it offers small prospect of recovery and will probably lead to the patient's early decease. You must be prepared to learn from the doctors, however, that, in a number of cases which display severe symptoms such as these, it is justifiable to take a different and a far more favourable view. If a picture of this kind is presented by a young patient of the female sex, whose vital internal organs (heart, kidneys, etc.) are shown on objective examination to be normal, but who has been subjected to violent *emotional* shocks - if, moreover, her various symptoms differ in certain matters of detail from what would have been expected - then doctors are not inclined to take the case too seriously. They decide that what they have before them is not an organic disease of the brain, but the enigmatic condition which, from the time of ancient Greek medicine, has been known as 'hysteria' and which has the power of producing illusory pictures of a whole number of serious diseases. They consider that there is then no risk to life but that a return to health - even a complete one - is probable. It is not always quite easy to distinguish a hysteria like this from a severe organic illness. There is no need for us to know, however, how a differential diagnosis of that kind is made; it will suffice to have an assurance that the case of Breuer's patient was precisely of a kind in which no competent physician could fail to make a diagnosis of hysteria. And here we may quote from the report of the patient's illness the further fact that it made its appearance at a time when she was nursing her father, of whom she was devotedly fond, through the grave illness which led to his death, and that, as a result of her own illness, she was obliged to give up nursing him.

¹ [The French term.]

So far it has been an advantage to us to accompany the doctors; but the moment of parting is at hand. For you must not suppose that a patient's prospects of medical assistance are improved in essentials by the fact that a diagnosis of hysteria has been substituted for one of severe organic disease of the brain. Medical skill is in most cases powerless against severe diseases of the brain; but neither can the doctor do anything against hysterical disorders. He must leave it to kindly Nature to decide when and how his optimistic prognosis shall be fulfilled.¹

Thus the recognition of the illness as hysteria makes little difference to the patient; but to the doctor quite the reverse. It is noticeable that his attitude towards hysterical patients is quite other than towards sufferers from organic diseases. He does not have the same sympathy for the former as for the latter: for the hysteric's ailment is in fact far less serious and yet it seems to claim to be regarded as equally so. And there is a further factor at work. Through his studies, the doctor has learnt many things that remain a sealed book to the layman: he has been able to form ideas on the causes of illness and on the changes it brings about - e.g. in the brain of a person suffering from apoplexy or from a malignant growth - ideas which must to some degree meet the case, since they allow him to understand the details of the illness. But all his knowledge - his training in anatomy, in physiology and in pathology - leaves him in the lurch when he is confronted by the details of hysterical phenomena. He cannot understand hysteria, and in the face of it he is himself a layman. This is not a pleasant situation for anyone who as a rule sets so much store by his knowledge. So it comes about that hysterical patients forfeit his sympathy. He regards them as people who are transgressing the laws of his science - like heretics in the eyes of the orthodox. He attributes every kind of wickedness to them, accuses them of exaggeration, of deliberate deceit, of malingering. And he punishes them by withdrawing his interest from them.

¹ I am aware that this is no longer the case; but in my lecture I am putting myself and my hearers back into the period before 1880. If things are different now, that is to a great extent the result of the activities whose history I am now sketching.

Dr. Breuer's attitude towards his patient deserved no such reproach. He gave her both sympathy and interest, even though, to begin with, he did not know how to help her. It seems likely that she herself made his task easier by the admirable qualities of intellect and character to which he has testified in her case history. Soon, moreover, his benevolent scrutiny showed him the means of bringing her a first instalment of help.

It was observed that, while the patient was in her states of '*absence*' (altered personality accompanied by confusion), she was in the habit of muttering a few words to herself which seemed as though they arose from some train of thought that was occupying her mind. The doctor, after getting a report of these words, used to put her into a kind of hypnosis and then repeat them to her so as to induce her to use them as a starting point. The patient complied with the plan, and in this way reproduced in his presence the mental creations which had been occupying her mind during the '*absences*' and which had betrayed their existence by the fragmentary words which she had uttered. They were profoundly melancholy phantasies - 'day dreams' we should call them - sometimes characterized by poetic beauty, and their starting-point was as a rule the position of a girl at her father's sick-bed. When she had related a number of these phantasies, she was as if set free, and she was brought back to normal mental life. The improvement in her condition, which would last for several hours, would be succeeded next day by a further attack of '*absence*'; and this in turn would be removed in the same way by getting her to put into words her freshly constructed phantasies. It was impossible to escape the conclusion that the alteration in her mental state which was expressed in the '*absences*' was a result of the stimulus proceeding from these highly emotional phantasies. The patient herself, who, strange to say, could at this time only speak and understand English, christened this novel kind of treatment the 'talking cure'¹ or used to refer to it jokingly as 'chimney sweeping'.¹

¹ [In English in the original.]

It soon emerged, as though by chance, that this process of sweeping the mind clean could accomplish more than the merely temporary relief of her ever-recurring mental confusion. It was actually possible to bring about the disappearance of the painful symptoms of her illness, if she could be brought to remember under hypnosis, with an accompanying expression of affect, on what occasion and in what connection the symptom had first appeared. 'It was in the summer during a period of extreme heat, and the patient was suffering very badly from thirst; for, without being able to account for it in any way, she suddenly found it impossible to drink. She would take up the glass of water that she longed for, but as soon as it touched her lips she would push it away like someone suffering from hydrophobia. As she did this, she was obviously in an *absence* for a couple of seconds. She lived only on fruit, such as melons, etc., so as to lessen her tormenting thirst. This had lasted for some six weeks, when one day during hypnosis she grumbled about her English "lady-companion", whom she did not care for, and went on to describe, with every sign of disgust, how she had once gone into this lady's room and how her little dog - horrid creature! - had drunk out of a glass there. The patient had said nothing, as she had wanted to be polite. After giving further energetic expression to the anger she had held back, she asked for something to drink, drank a large quantity of water without any difficulty, and awoke from her hypnosis with the glass at her lips; and thereupon the disturbance vanished, never to return.'¹

With your permission, I should like to pause a moment over this event. Never before had anyone removed a hysterical symptom by such a method or had thus gained so deep an insight into its causation. It could not fail to prove a momentous discovery if the expectation were confirmed that others of the patient's symptoms - perhaps the majority of them - had arisen and could be removed in this same manner. Breuer spared no pains in convincing himself that this was so, and he proceeded to a systematic investigation of the pathogenesis of the other and more serious symptoms of the patient's illness. And it really was so. Almost all the symptoms had arisen in this way as residues - 'precipitates' they might be called - of emotional experiences. To these experiences, therefore, we later gave the name of 'psychical traumas', while the particular nature of the symptoms was explained by their relation to the traumatic scenes which were their cause. They were, to use a technical term, 'determined' by the scenes of whose recollection they represented residues, and it was no longer necessary to describe them as capricious or enigmatic products of the neurosis. One unexpected point, however, must be noticed. What left the symptom behind was not always a *single* experience. On the contrary, the result was usually brought about by the convergence of several traumas, and often by the repetition of a great number of similar ones. Thus it was necessary to reproduce the whole chain of pathogenic memories in chronological order, or rather in reversed order, the latest ones first and the earliest ones last; and it was quite impossible to jump over the later traumas in order to get back more quickly to the first, which was often the most potent one.

¹ *Studies on Hysteria*.

No doubt you will now ask me for some further instances of the causation of hysterical symptoms besides the one I have already given you of a fear of water produced by disgust at a dog drinking out of a glass. But if I am to keep to my programme I shall have to restrict myself to very few examples. In regard to the patient's disturbances of vision, for instance, Breuer describes how they were traced back to occasions such as one on which, 'when she was sitting by her father's bedside with tears in her eyes, he suddenly asked her what time it was. She could not see clearly; she made a great effort, and brought her watch near to her eyes. The face of the watch now seemed very big - thus accounting for her macropsia and convergent squint. Or again, she tried hard to suppress her tears so that the sick man should not see them.'¹ Moreover, all of the pathogenic impressions came from the period during which she was helping to nurse her sick father. 'She once woke up during the night in great anxiety about the patient, who was in a high fever; and she was under the strain of expecting the arrival of a surgeon from Vienna who was to operate. Her mother had gone away for a short time and Anna was sitting at the bedside with her right arm over the back of her chair. She fell into a waking dream and saw a black snake coming towards the sick man from the wall to bite him. (It is most likely that there were in fact snakes in the field behind the house and that these had previously given the girl a fright; they would thus have provided the material for her hallucination.) She tried to keep the snake off, but it was as though she was paralysed. Her right arm, over the back of the chair, had gone to sleep, and had become anaesthetic and paretic; and when she looked at it the fingers turned into little snakes with death's heads (the nails). (It seems probable that she had tried to use her paralysed right hand to drive off the snake and that its anaesthesia and paralysis has consequently become associated with the hallucination of the snake.) When the snake vanished, in her terror she tried to pray. But language failed her: she could find no tongue in which to speak, till at last she thought of some children's verses in English and then found herself able to think and pray in that language.'¹ When the patient had recollected this scene in hypnosis, the rigid paralysis of her left arm, which had persisted since the beginning of her illness, disappeared, and the treatment was brought to an end.

¹ *Studies on Hysteria*.

When, some years later, I began to employ Breuer's method of examination and treatment on patients of my own, my experiences agreed entirely with his. A lady, aged about forty, suffered from a *tic* consisting of a peculiar 'clacking' sound which she produced whenever she was excited, or sometimes for no visible reason. It had its origin in two experiences, whose common element lay in the fact that at the moment of their occurrence she had formed a determination not to make any noise, and in the fact that on both these occasions a kind of counter-will led her to break the silence with this same sound. On the first of these occasions one of her children had been ill, and, when she had at last with great difficulty succeeded in getting it off to sleep, she had said to herself that she must keep absolutely still so as not to wake it. On the other occasion, while she was driving with her two children in a thunderstorm, the horses had bolted and she had carefully tried to avoid making any noise for fear of frightening them even more.¹ I give you this one example out of a number of others which are reported in the *Studies on Hysteria*.²

¹ *Studies on Hysteria*.

² Extracts from that volume, together with some later writings of mine on hysteria, are now to be had in an English translation prepared by Dr. A. A. Brill of New York.

Ladies and Gentlemen, if I may be allowed to generalize - which is unavoidable in so condensed an account as this - I should like to formulate what we have learned so far as follows: *our hysterical patients suffer from reminiscences*. Their symptoms are residues and mnemonic symbols of particular (traumatic) experiences. We may perhaps obtain a deeper understanding of this kind of symbolism if we compare them with other mnemonic symbols in other fields. The monuments and memorials with which large cities are adorned are also mnemonic symbols. If you take a walk through the streets of London, you will find, in front of one of the great railway termini, a richly carved Gothic column - Charing Cross. One of the old Plantagenet kings of the thirteenth century ordered the body of his beloved Queen Eleanor to be carried to Westminster; and at every stage at which the coffin rested he erected a Gothic cross. Charing Cross is the last of the monuments that commemorate the funeral cortège.¹ At another point in the same town, not far from London Bridge, you will find a towering, and more modern, column, which is simply known as 'The Monument'. It was designed as a memorial of the Great Fire, which broke out in that neighbourhood in 1666 and destroyed a large part of the city. These monuments, then, resemble hysterical symptoms in being mnemonic symbols; up to that point the comparison seems justifiable. But what should we think of a Londoner who paused to-day in deep melancholy before the memorial of Queen Eleanor's funeral instead of going about his business in the hurry that modern working conditions demand or instead of feeling joy over the youthful queen of his own heart? Or again what should we think of a Londoner who shed tears before the Monument that commemorates the reduction of his beloved metropolis to ashes although it has long since risen again in far greater brilliance? Yet every single hysteric and neurotic behaves like these two unpractical Londoners. Not only do they remember painful experiences of the remote past, but they still cling to them emotionally; they cannot get free of the past and for its sake they neglect what is real and immediate. This fixation of mental life to pathogenic traumas is one of the most significant and practically important characteristics of neurosis.

I am quite ready to allow the justice of an objection that you are probably raising at this moment on the basis of the case history of Breuer's patient. It is quite true that all her traumas dated from the period when she was nursing her sick father and that her symptoms can only be regarded as mnemonic signs of his illness and death. Thus they correspond to a display of mourning, and there is certainly nothing pathological in being fixated to the memory of a dead person so short a time after his decease; on the contrary, it would be a normal emotional process. I grant you that in the case of Breuer's patient there is nothing striking in her fixation to her trauma. But in other cases - such as that of the *tic* that I treated myself, where the determinants dated back more than fifteen and ten years - the feature of an abnormal attachment to the past is very clear; and it seems likely that Breuer's patient would have developed a similar feature if she had not received cathartic treatment so soon after experiencing the traumas and developing the symptoms.

¹ Or rather, it is a modern copy of one of these monuments. As Dr. Ernest Jones tells me, the name 'Charing' is believed to be derived from the words '*chère reine*'.

So far we have only been discussing the relations between a patient's hysterical symptoms and the events of her life. There are, however, two further factors in Breuer's observation which enable us to form some notion of how the processes of falling ill and of recovering occur.

In the first place, it must be emphasized that Breuer's patient, in almost all her pathogenic situations, was obliged to *suppress* a powerful emotion instead of allowing its discharge in the appropriate signs of emotion, words or actions. In the episode of her lady-companion's dog, she suppressed any manifestation of her very intense disgust, out of consideration for the woman's feelings; while she watched at her father's bedside she was constantly on the alert to prevent the sick man from observing her anxiety and her painful depression. When subsequently she reproduced these scenes in her doctor's presence the affect which had been inhibited at the time emerged with peculiar violence, as though it had been saved up for a long time. Indeed, the symptom which was left over from one of these scenes would reach its highest pitch of intensity at the time when its determining cause was being approached, only to vanish when that cause had been fully ventilated. On the other hand, it was found that no result was produced by the recollection of a scene in the doctor's presence if for some reason the recollection took place without any generation of affect. Thus it was what happened to these affects, which might be regarded as displaceable magnitudes, that was the decisive factor both for the onset of illness and for recovery. One was driven to assume that the illness occurred because the affects generated in the pathogenic situations had their normal outlet blocked, and that the essence of the illness lay in the fact that these 'strangled' affects were then put to an abnormal use. In part they remained as a permanent burden upon the patient's mental life and a source of constant excitation for it; and in part they underwent a transformation into unusual somatic innervations and inhibitions, which manifested themselves as the physical symptoms of the case. For this latter process we coined the term 'hysterical conversion'. Quite apart from this, a certain portion of our mental excitation is normally directed along the paths of somatic innervation and produces what we know as an 'expression of the emotions'. Hysterical conversion exaggerates this portion of the discharge of an emotionally cathected mental process; it represents a far more intense expression of the emotions, which has entered upon a new path. When the bed of a stream is divided into two channels, then, if the current in one of them is brought up against an obstacle, the other will at once be overfilled. As you see, we are on the point of arriving at a purely psychological theory of hysteria, with affective processes in the front rank.

A second observation of Breuer's, again, compels us to attach great importance, among the characteristics of the pathological chain of events, to states of consciousness. Breuer's patient exhibited, alongside of her normal state, a number of mental peculiarities: conditions of '*absence*', confusion, and alterations of character. In her normal state she knew nothing of the pathogenic scenes or their connection with her symptoms; she had forgotten the scenes, or at all events had severed the pathogenic link. When she was put under hypnosis, it was possible, at the expense of a considerable amount of labour, to recall the scenes to her memory; and, through this work of recollecting, the symptoms were removed. The explanation of this fact would be a most awkward business, were it not that the way is pointed by experiences and experiments in hypnotism. The study of hypnotic phenomena has accustomed us to what was at first a bewildering realization that in one and the same individual there can be several mental groupings, which can remain more or less independent of one another, which can 'know nothing' of one another and which can alternate with one another in their hold upon consciousness. Cases of this kind, too, occasionally appear spontaneously, and are then described as examples of '*double conscience*'.¹ If, where a splitting of the personality such as this has occurred, consciousness remains attached regularly to one of the two states, we call it the *conscious* mental state and the other, which is detached from it, the *unconscious* one. In the familiar condition known as 'post-hypnotic suggestion', a command given under hypnosis is slavishly carried out subsequently in the normal state. This phenomenon affords an admirable example of the influences which the unconscious state can exercise over the conscious one; moreover, it provides a pattern upon which we can account for the phenomena of hysteria. Breuer adopted a hypothesis that hysterical symptoms arise in peculiar mental conditions to which he gave the name of 'hypnoid'. On this view, excitations occurring during these hypnoid states can easily become pathogenic because such states do not provide opportunities for the normal discharge of the process of excitation. There consequently arises from the process of excitation an unusual product - the symptom. This finds its way, like a foreign body, into the normal state, which in turn is in ignorance of the hypnoid pathogenic situation. Wherever there is a symptom there is also an amnesia, a gap in the memory, and filling up this gap implies the removal of the conditions which led to the production of the symptom.

¹ [The French term for 'dual consciousness'.]

This last part of my account will not, I fear, strike you as particularly clear. But you should bear in mind that we are dealing with novel and difficult considerations, and it may well be that it is not possible to make them much clearer - which shows that we still have a long way to go in our knowledge of the subject. Moreover, Breuer's theory of 'hypnoid states' turned out to be impeding and unnecessary, and it has been dropped by psycho-analysis to-day. Later on, you will at least have a hint of the influences and processes that were to be discovered behind the screen of hypnoid states erected by Breuer. You will have rightly formed the opinion, too, that Breuer's investigation has only succeeded in offering you a very incomplete theory and an unsatisfying explanation of the phenomena observed. But complete theories do not fall ready-made from the sky and you would have even better grounds for suspicion if anyone presented you with a flawless and complete theory at the very beginning of his observations. Such a theory could only be a child of his speculation and could not be the fruit of an unprejudiced examination of the facts.

SECOND LECTURE

LADIES AND GENTLEMEN, - At about the same time at which Breuer was carrying on the 'talking cure' with his patient, the great Charcot in Paris had begun the researches into hysterical patients at the Salpêtrière which were to lead to a new understanding of the disease. There was no possibility of his findings being known in Vienna at that time. But when, some ten years later, Breuer and I published our 'Preliminary Communication' on the psychical mechanism of hysterical phenomena, we were completely under the spell of Charcot's researches. We regarded the pathogenic experiences of our patients as psychical traumas, and equated them with the somatic traumas whose influence on hysterical paralyses had been established by Charcot; and Breuer's hypothesis of hypnoid states was itself nothing but a reflection of the fact that Charcot had reproduced those traumatic paralyses artificially under hypnosis.

The great French observer, whose pupil I became in 1885-6, was not himself inclined to adopt a psychological outlook. It was his pupil, Pierre Janet, who first attempted a deeper approach to the peculiar psychical processes present in hysteria, and we followed his example when we took the splitting of the mind and dissociation of the personality as the centre of our position. You will find in Janet a theory of hysteria which takes into account the prevailing views in France on the part played by heredity and degeneracy. According to him, hysteria is a form of degenerate modification of the nervous system, which shows itself in an innate weakness in the power of psychical synthesis. Hysterical patients, he believes, are inherently incapable of holding together the multiplicity of mental processes into a unity, and hence arises the tendency to mental dissociation. If I may be allowed to draw a homely but clear analogy, Janet's hysterical patient reminds one of a feeble woman who has gone out shopping and is now returning home laden with a multitude of parcels and boxes. She cannot contain the whole heap of them with her two arms and ten fingers. So first of all one object slips from her grasp; and when she stoops to pick it up, another one escapes her in its place, and so on. This supposed mental weakness of hysterical patients is not confirmed when we find that, alongside these phenomena of diminished capacity, examples are also to be observed of a partial increase in efficiency: as though by way of compensation. At the time when Breuer's patient had forgotten her mother tongue and every other language but English, her grasp of English reached such heights that, if she was handed a German book, she was able straight away to read out a correct and fluent translation of it.

When, later on, I set about continuing on my own account the investigations that had been begun by Breuer, I soon arrived at another view of the origin of hysterical dissociation (the splitting of consciousness). A divergence of this kind, which was to be decisive for everything that followed, was inevitable, since I did not start out, like Janet, from laboratory experiments, but with therapeutic aims in mind.

I was driven forward above all by practical necessity. The cathartic procedure, as carried out by Breuer, presupposed putting the patient into a state of deep hypnosis; for it was only in a state of hypnosis that he attained a knowledge of the pathogenic connections which escaped him in his normal state. But I soon came to dislike hypnosis, for it was a temperamental and, one might almost say, a mystical ally. When I found that, in spite of all my efforts, I could not succeed in bringing more than a fraction of my patients into a hypnotic state, I determined to give up hypnosis and to make the cathartic procedure independent of it. Since I was not able at will to alter the mental state of the majority of my patients, I set about working with them in their *normal* state. At first, I must confess, this seemed a senseless and hopeless undertaking. I was set the task of learning from the patient something that I did not know and that he did not know himself. How could one hope to elicit it? But there came to my help a recollection of a most remarkable and instructive experiment which I had witnessed when I was with Bernheim at Nancy. Bernheim showed us that people whom he had put into a state of hypnotic somnambulism, and who had had all kinds of experiences while they were in that state, only *appeared* to have lost the memory of what they had experienced during somnambulism; it was possible to revive these memories in their normal state. It is true that, when he questioned them about their somnambulist experiences, they began by maintaining that they knew nothing about them; but if he refused to give way, and insisted, and assured them that they *did* know about them, the forgotten experiences always reappeared.

So I did the same thing with my patients. When I reached a point with them at which they maintained that they knew nothing more, I assured them that they *did* know it all the same, and that they had only to say it; and I ventured to declare that the right memory would occur to them at the moment at which I laid my hand on their forehead. In that way I succeeded, without using hypnosis, in obtaining from the patients whatever was required for establishing the connection between the pathogenic scenes they had forgotten and the symptoms left over from those scenes. But it was a laborious procedure, and in the long run an exhausting one; and it was unsuited to serve as a permanent technique.

I did not abandon it, however, before the observations I made during my use of it afforded me decisive evidence. I found confirmation of the fact that the forgotten memories were not lost. They were in the patient's possession and were ready to emerge in association to what was still known by him; but there was some force that prevented them from becoming conscious and compelled them to remain unconscious. The existence of this force could be assumed with certainty, since one became aware of an effort corresponding to it if, in opposition to it, one tried to introduce the unconscious memories into the patient's consciousness. The force which was maintaining the pathological condition became apparent in the form of *resistance* on the part of the patient.

It was on this idea of resistance, then, that I based my view of the course of psychical events in hysteria. In order to effect a recovery, it had proved necessary to remove these resistances. Starting out from the mechanism of cure, it now became possible to construct quite definite ideas of the origin of the illness. The same forces which, in the form of resistance, were now offering opposition to the forgotten material's being made conscious, must formerly have brought about the forgetting and must have pushed the pathogenic experiences in question out of consciousness. I gave the name of '*repression*' to this hypothetical process, and I considered that it was proved by the undeniable existence of resistance.

The further question could then be raised as to what these forces were and what the determinants were of the repression in which we now recognized the pathogenic mechanism of hysteria. A comparative study of the pathogenic situations which we had come to know through the cathartic procedure made it possible to answer this question. All these experiences had involved the emergence of a wishful impulse which was in sharp contrast to the subject's other wishes and which proved incompatible with the ethical and aesthetic standards of his personality. There had been a short conflict, and the end of this internal struggle was that the idea which had appeared before consciousness as the vehicle of this irreconcilable wish fell a victim to repression, was pushed out of consciousness with all its attached memories, and was forgotten. Thus the incompatibility of the wish in question with the patient's ego was the motive for the repression; the subject's ethical and other standards were the repressing forces. An acceptance of the incompatible wishful impulse or a prolongation of the conflict would have produced a high degree of unpleasure; this unpleasure was avoided by means of repression, which was thus revealed as one of the devices serving to protect the mental personality.

To take the place of a number of instances, I will relate a single one of my cases, in which the determinants and advantages of repression are sufficiently evident. For my present purpose I shall have once again to abridge the case history and omit some important underlying material. The patient was a girl, who had lost her beloved father after she had taken a share in nursing him - a situation analogous to that of Breuer's patient. Soon afterwards her elder sister married, and her new brother-in-law aroused in her a peculiar feeling of sympathy which was easily masked under a disguise of family affection. Not long afterwards her sister fell ill and died, in the absence of the patient and her mother. They were summoned in all haste without being given any definite information of the tragic event. When the girl reached the bedside of her dead sister, there came to her for a brief moment an idea that might be expressed in these words: 'Now he is free and can marry me.' We may assume with certainty that this idea, which betrayed to her consciousness the intense love for her brother-in-law of which she had not herself been conscious, was surrendered to repression a moment later, owing to the revolt of her feelings. The girl fell ill with severe hysterical symptoms; and while she was under my treatment it turned out that she had completely forgotten the scene by her sister's bedside and the odious egoistic impulse that had emerged in her. She remembered it during the treatment and reproduced the pathogenic moment with signs of the most violent emotion, and, as a result of the treatment, she became healthy once more.

Perhaps I may give you a more vivid picture of repression and of its necessary relation to resistance, by a rough analogy derived from our actual situation at the present moment. Let us suppose that in this lecture-room and among this audience, whose exemplary quiet and attentiveness I cannot sufficiently commend, there is nevertheless someone who is causing a disturbance and whose ill-mannered laughter, chattering and shuffling with his feet are distracting my attention from my task. I have to announce that I cannot proceed with my lecture; and thereupon three or four of you who are strong men stand up and, after a short struggle, put the interrupter outside the door. So now he is 'repressed', and I can continue my lecture. But in order that the interruption shall not be repeated, in case the individual who has been expelled should try to enter the room once more, the gentlemen who have put my will into effect place their chairs up against the door and thus establish a 'resistance' after the repression has been accomplished. If you will now translate the two localities concerned into psychical terms as the 'conscious' and the 'unconscious', you will have before you a fairly good picture of the process of repression.

You will now see in what it is that the difference lies between our view and Janet's. We do not derive the psychical splitting from an innate incapacity for synthesis on the part of the mental apparatus; we explain it dynamically, from the conflict of opposing mental forces and recognize it as the outcome of an active struggling on the part of the two psychical groupings against each other. But our view gives rise to a large number of fresh problems. Situations of mental conflict are, of course, exceedingly common; efforts by the ego to ward off painful memories are quite regularly to be observed without their producing the result of a mental split. The reflection cannot be escaped that further determinants must be present if the conflict is to lead to dissociation. I will also readily grant you that the hypothesis of repression leaves us not at the end but at the beginning of a psychological theory. We can only go forward step by step however, and complete knowledge must await the results of further and deeper researches.

Nor is it advisable to attempt to explain the case of Breuer's patient from the point of view of repression. That case history is not suited to this purpose, because its findings were reached with the help of hypnotic influence. It is only if you exclude hypnosis that you can observe resistances and repressions and form an adequate idea of the truly pathogenic course of events. Hypnosis conceals the resistance and renders a certain area of the mind accessible; but, as against this, it builds up the resistance at the frontiers of this area into a wall that makes everything beyond it inaccessible.

Our most valuable lesson from Breuer's observation was what it proved concerning the relation between symptoms and pathogenic experiences or psychical traumas, and we must not omit now to consider these discoveries from the standpoint of the theory of repression. At first sight it really seems impossible to trace a path from repression to the formation of symptoms. Instead of giving a complicated theoretical account, I will return here to the analogy which I employed earlier for my explanation of repression. If you come to think of it, the removal of the interrupter and the posting of the guardians at the door may not mean the end of the story. It may very well be that the individual who has been expelled, and who has now become embittered and reckless, will cause us further trouble. It is true that he is no longer among us; we are free from his presence, from his insulting laughter and his *sotto voce* comments. But in some respects, nevertheless, the repression has been unsuccessful; for now he is making an intolerable exhibition of himself outside the room, and his shouting and banging on the door with his fists interfere with my lecture even more than his bad behaviour did before. In these circumstances we could not fail to be delighted if our respected president, Dr. Stanley Hall, should be willing to assume the role of mediator and peacemaker. He would have a talk with the unruly person outside and would then come to us with a request that he should be re-admitted after all: he himself would guarantee that the man would now behave better. On Dr. Hall's authority we decide to lift the repression, and peace and quiet are restored. This presents what is really no bad picture of the physician's task in the psycho-analytic treatment of the neuroses.

To put the matter more directly. The investigation of hysterical patients and of other neurotics leads us to the conclusion that their repression of the idea to which the intolerable wish is attached has been a *failure*. It is true that they have driven it out of consciousness and out of memory and have apparently saved themselves a large amount of unpleasure. *But the repressed wishful impulse continues to exist in the unconscious*. It is on the look-out for an opportunity of being activated, and when that happens it succeeds in sending into consciousness a disguised and unrecognizable *substitute* for what had been repressed, and to this there soon become attached the same feelings of unpleasure which it was hoped had been saved by the repression. This substitute for the repressed idea - the *symptom* - is proof against further attacks from the defensive ego; and in place of the short conflict an ailment now appears which is not brought to an end by the passage of time. Alongside the indication of distortion in the symptom, we can trace in it the remains of some kind of indirect resemblance to the idea that was originally repressed. The paths along which the substitution was effected can be traced in the course of the patient's psycho-analytic treatment; and in order to bring about recovery, the symptom must be led back along the same paths and once more turned into the repressed idea. If what was repressed is brought back again into conscious mental activity - a process which presupposes the overcoming of considerable resistances - the resulting psychical conflict, which the patient had tried to avoid, can, under the physician's guidance, reach a better outcome than was offered by repression. There are a number of such opportune solutions, which may bring the conflict and the neurosis to a happy end, and which may in certain instances be combined. The patient's personality may be convinced that it has been wrong in rejecting the pathogenic wish and may be led into accepting it wholly or in part; or the wish itself may be directed to a higher and consequently unobjectionable aim (this is what we call its 'sublimation'); or the rejection of the wish may be recognized as a justifiable one, but the automatic and therefore inefficient mechanism of repression may be replaced by a condemning judgement with the help of the highest human mental functions - conscious control of the wish is attained.

Five Lectures On Psycho-Analysis

2216

You must forgive me if I have not succeeded in giving you a more clearly intelligible account of these basic positions adopted by the method of treatment that is now described as 'psycho-analysis'. The difficulties have not lain only in the novelty of the subject. The nature of the incompatible wishes which, in spite of repression, succeed in making their existence in the unconscious perceptible, and the subjective and constitutional determinants which must be present in anyone before a failure of repression can occur and a substitute or symptom be formed - on all this I shall have more light to throw in some of my later observations.

THIRD LECTURE

LADIES AND GENTLEMEN, - It is not always easy to tell the truth especially when one has to be concise; and I am thus to-day obliged to correct a wrong statement that I made in my last lecture. I said to you that, having dispensed with hypnosis, I insisted on my patients nevertheless telling me what occurred to them in connection with the subject under discussion, and assured them that they really knew everything that they had ostensibly forgotten and that the idea that occurred to them would infallibly contain what we were in search of; and I went on to say to you that I found that the first idea occurring to my patients did in fact produce the right thing and turned out to be the forgotten continuation of the memory. This, however, is not in general the case, and I only put the matter so simply for the sake of brevity. Actually it was only for the first few times that the right thing which had been forgotten turned up as a result of simple insistence on my part. When the procedure we carried further, ideas kept on emerging that could not be the right ones, since they were not appropriate and were rejected as being wrong by the patients themselves. Insistence was of no further help at this point, and I found myself once more regretting my abandonment of hypnosis.

While I was thus at a loss, I clung to a prejudice the scientific justification for which was proved years later by my friend C. G. Jung and his pupils in Zurich. I am bound to say that it is sometimes most useful to have prejudices. I cherished a high opinion of the strictness with which mental processes are determined, and I found it impossible to believe that an idea produced by a patient while his attention was on the stretch could be an arbitrary one and unrelated to the idea we were in search of. The fact that the two ideas were not identical could be satisfactorily explained from the postulated psychological state of affairs. In the patient under treatment two forces were in operation against each other: on the one hand, his conscious endeavour to bring into consciousness the forgotten idea in his unconscious, and on the other hand, the resistance we already know about, which was striving to prevent what was repressed or its derivatives from thus becoming conscious. If this resistance amounted to little or nothing, what had been forgotten became conscious without distortion. It was accordingly plausible to suppose that the greater the resistance against what we were in search of becoming conscious, the greater would be its distortion. The idea which occurred to the patient in place of what we were in search of had thus itself originated like a symptom: it was a new, artificial and ephemeral substitute for what had been repressed, and was dissimilar to it in proportion to the degree of distortion it had undergone under the influence of the resistance. But, owing to its nature as a symptom, it must nevertheless have a certain similarity to what we were in search of; and if the resistance were not too great, we ought to be able to guess the latter from the former. The idea occurring to the patient must be in the nature of an *allusion* to the repressed element, like a representation of it in indirect speech.

We know cases in the field of normal mental life in which situations analogous to the one we have just assumed produce similar results. One such case is that of jokes. The problems of psycho-analytic technique have compelled me to investigate the technique of making jokes. I will give you one example of this - incidentally, a joke in English.

This is the anecdote.¹ Two not particularly scrupulous business men had succeeded, by dint of a series of highly risky enterprises, in amassing a large fortune, and they were now making efforts to push their way into good society. One method, which struck them as a likely one, was to have their portraits painted by the most celebrated and highly-paid artist in the city, whose pictures had an immense reputation. The precious canvases were shown for the first time at a large evening party, and the two hosts themselves led the most influential connoisseur and art critic up to the wall on which the portraits were hanging side by side. He studied the works for a long time, and then, shaking his head, as though there was something he had missed, pointed to the gap between the pictures and asked quietly: 'But where's the Saviour?'² I see you are all much amused at this joke. Let us now proceed to examine it. Clearly what the connoisseur meant to say was: 'You are a couple of rogues, like the two thieves between whom the Saviour was crucified.' But he did not say this. Instead he made a remark which seems at first sight strangely inappropriate and irrelevant, but which we recognize a moment later as an *allusion* to the insult that he had in mind and as a perfect substitute for it. We cannot expect to find in jokes *all* the characteristics that we have attributed to the ideas occurring to our patients, but we must stress the identity of the *motive* for the joke and for the idea. Why did the critic not tell the rogues straight out what he wanted to say? Because he had excellent counter-motives working against his desire to say it to their faces. There are risks attendant upon insulting people who are one's hosts and who have at their command the fists of a large domestic staff. One might easily meet with the fate which I suggested in my last lecture as an analogy for repression. That was the reason why the critic did not express the insult he had in mind directly but in the form of an 'allusion accompanied by omission'; and the same state of things is responsible for our patients' producing a more or less distorted *substitute* instead of the forgotten idea we are in search of.

¹ Cf. *Jokes and their Relation to the Unconscious*, 1905c.

² [In English in the original.]

It is highly convenient, Ladies and Gentlemen, to follow the Zurich school (Bleuler, Jung, etc.) in describing a group of interdependent ideational elements cathected with affect as a 'complex'. We see, then, that if in our search for a repressed complex in one of our patients we start out from the last thing he remembers, we shall have every prospect of discovering the complex, provided that the patient puts a sufficient number of his free associations at our disposal. Accordingly, we allow the patient to say whatever he likes, and hold fast to the postulate that nothing can occur to him which is not in an indirect fashion dependent on the complex we are in search of. If this method of discovering what is repressed strikes you as unduly circumstantial, I can at least assure you that it is the only practicable one.

When we come to putting this procedure into effect, we are subject to yet another interference. For the patient will often pause and come to a stop, and assert that he can think of nothing to say, and that nothing whatever occurs to his mind. If this were so and if the patient were right, then our procedure would once again have proved ineffective. But closer observation shows that such a stoppage of the flow of ideas never in fact occurs. It *appears* to happen only because the patient holds back or gets rid of the idea that he has become aware of, under the influence of the resistances which disguise themselves as various critical judgements about the value of the idea that has occurred to him. We can protect ourselves against this by warning him beforehand of this behaviour and requiring him to take no notice of such criticisms. He must, we tell him, entirely renounce any critical selection of this kind and say whatever comes into his head, even if he considers it incorrect or irrelevant or nonsensical, and above all if he finds it disagreeable to let himself think about what has occurred to him. So long as this ordinance is carried out we are certain of obtaining the material which will put us on the track of the repressed complexes.

This associative material, which the patient contemptuously rejects when he is under the influence of the resistance instead of under the doctor's, serves the psycho-analyst, as it were, as ore from which, with the help of some simple interpretative devices, he extracts its content of precious metal. If you are anxious to gain a rapid and provisional knowledge of a patient's repressed complexes, without as yet entering into their arrangement and interconnection, you will employ as a method of examination the 'association experiment' as it has been developed by Jung (1906) and his pupils. This procedure offers the psycho-analyst what qualitative analysis offers the chemist. In the treatment of neurotic patients it can be dispensed with; but it is indispensable for the objective demonstration of complexes and in the examination of the psychoses, which has been embarked on with so much success by the Zurich school.

Working over the ideas that occur to patients when they submit to the main rule of psycho-analysis is not our only technical method of discovering the unconscious. The same purpose is served by two other procedures: the interpretation of patients' dreams and the exploitation of their faulty and haphazard actions.

I must admit, Ladies and Gentlemen, that I hesitated for a long time whether, instead of giving you this condensed general survey of the whole field of psycho-analysis, it might not be better to present you with a detailed account of dream-interpretation.¹ I was held back by a purely subjective and seemingly secondary motive. It seemed to me almost indecent in a country which is devoted to practical aims to make my appearance as a 'dream-interpreter', before you could possibly know the importance that can attach to that antiquated and derided art. The interpretation of dreams is in fact the royal road to a knowledge of the unconscious; it is the securest foundation of psycho-analysis and the field in which every worker must acquire his convictions and seek his training. If I am asked how one can become a psycho-analyst, I reply: 'By studying one's own dreams.' Every opponent of psycho-analysis hitherto has, with a nice discrimination, either evaded any consideration of *The Interpretation of Dreams*, or has sought to skirt over it with the most superficial objections. If, on the contrary, you can accept the solutions of the problems of dream-life, the novelties with which psycho-analysis confronts your minds will offer you no further difficulties.

You should bear in mind that the dreams which we produce at night have, on the one hand, the greatest external similarity and internal kinship with the creations of insanity, and are, on the other hand, compatible with complete health in waking life. There is nothing paradoxical in the assertion that no one who regards these 'normal' illusions, delusions and character-changes with astonishment instead of comprehension has the slightest prospect of understanding the abnormal structures of pathological mental states otherwise than as a layman. You may comfortably count almost all psychiatrists among such laymen.

¹ *The Interpretation of Dreams* (1900a).

I invite you now to follow me on a brief excursion through the region of dream-problems. When we are awake we are in the habit of treating dreams with the same contempt with which patients regard the associations that are demanded of them by the psycho-analyst. We dismiss them, too, by forgetting them as a rule, quickly and completely. Our low opinion of them is based on the strange character even of those dreams that are not confused and meaningless, and on the obvious absurdity and nonsensicalness of other dreams. Our dismissal of them is related to the uninhibited shamelessness and immorality of the tendencies openly exhibited in some dreams. It is well known that the ancient world did not share this low opinion of dreams. Nor are the lower strata of our own society to-day in any doubt about the value of dreams; like the peoples of antiquity, they expect them to reveal the future. I confess that I feel no necessity for making any mystical assumptions in order to fill the gaps in our present knowledge, and accordingly I have never been able to find anything to confirm the prophetic nature of dreams. There are plenty of other things - sufficiently wonderful too - to be said about them.

In the first place, not all dreams are alien to the dreamer, incomprehensible and confused. If you inspect the dreams of very young children, from eighteen months upwards, you will find them perfectly simple and easy to explain. Small children always dream of the fulfilment of wishes that were aroused in them the day before but not satisfied. You will need no interpretative art in order to find this simple solution; all you need do is to enquire into the child's experiences on the previous day (the 'dream-day'). Certainly the most satisfactory solution of the riddle of dreams would be to find that adults' dreams too were like those of children - fulfilments of wishful impulses that had come to them on the dream-day. And such in fact is the case. The difficulties in the way of this solution can be overcome step by step if dreams are analysed more closely.

The first and most serious objection is that the content of adults' dreams is as a rule unintelligible and could not look more unlike the fulfilment of a wish. And here is the answer. Such dreams have been subjected to distortion; the psychical process underlying them might originally have been expressed in words quite differently. You must distinguish the *manifest content of the dream*, as you vaguely recollect it in the morning and laboriously (and, as it seems, arbitrarily) clothe it in words, and the *latent dream-thoughts*, which you must suppose were present in the unconscious. This distortion in dreams is the same process that you have already come to know in investigating the formation of hysterical symptoms. It indicates, too, that the same interplay of mental forces is at work in the formation of dreams as in that of symptoms. The manifest content of the dream is the distorted substitute for the unconscious dream-thoughts and this distortion is the work of the ego's forces of defence - of resistances. In waking life these resistances altogether prevent the repressed wishes of the unconscious from entering consciousness; and during the lowered state of sleep they are at least strong enough to oblige them to adopt a veil of disguise. Thereafter, the dreamer can no more understand the meaning of his dreams than the hysteric can understand the connection and significance of his symptoms.

You can convince yourself that there are such things as latent dream-thoughts and that the relation between them and the manifest content of the dream is really as I have described it, if you carry out an analysis of dreams, the technique of which is the same as that of psycho-analysis. You entirely disregard the apparent connections between the elements in the manifest dream and collect the ideas that occur to you in connection with each separate element of the dream by free association according to the psycho-analytic rule of procedure. From this material you arrive at the latent dream-thoughts, just as you arrived at the patient's hidden complexes from his associations to his symptoms and memories. The latent dream-thoughts which have been reached in this way will at once show you how completely justified we have been in tracing back adults' dreams to children's dreams. The true meaning of the dream, which has now taken the place of its manifest content, is always clearly intelligible; it has its starting-point in experiences of the previous day, and proves to be a fulfilment of unsatisfied wishes. The manifest dream, which you know from your memory when you wake up, can therefore only be described as a *disguised* fulfilment of *repressed* wishes.

You can also obtain a view, by a kind of synthetic work, of the process which has brought about the distortion of the unconscious dream-thoughts into the manifest content of the dream. We call this process the 'dream-work'. It deserves our closest theoretical interest, since we are able to study in it, as nowhere else, what unsuspected psychical processes can occur in the unconscious, or rather, to put it more accurately, *between* two separate psychical systems like the conscious and unconscious. Among these freshly discovered psychical processes those of *condensation* and *displacement* are especially noticeable. The dream-work is a special case of the effects produced by two different mental groupings on each other - that is, of the consequences of mental splitting; and it seems identical in all essentials with the process of distortion which transforms the repressed complexes into symptoms where there is unsuccessful repression.

You will also learn with astonishment from the analysis of dreams (and most convincingly from that of your own) what an unsuspectedly great part is played in human development by impressions and experiences of early childhood. In dream-life the child that is in man pursues its existence, as it were, and retains all its characteristics and wishful impulses, even such as have become unserviceable in later life. There will be brought home to you with irresistible force the many developments, repressions, sublimations and reaction-formations, by means of which a child with a quite other innate endowment grows into what we call a normal man, the bearer, and in part the victim, of the civilization that has been so painfully acquired.

I should like you to notice, too, that the analysis of dreams has shown us that the unconscious makes use of a particular symbolism, especially for representing sexual complexes. This symbolism varies partly from individual to individual; but partly it is laid down in a typical form and seems to coincide with the symbolism which, as we suspect, underlies our myths and fairy tales. It seems not impossible that these creations of the popular mind might find an explanation through the help of dreams.

Lastly, I must warn you not to let yourselves be put out by the objection that the occurrence of anxiety-dreams contradicts our view of dreams as the fulfilments of wishes. Apart from the fact that these anxiety-dreams, like the rest, require interpretation before any judgement can be formed on them, it must be stated quite generally that the anxiety does not depend on the content of the dream in such a simple manner as one might imagine without having more knowledge and taking more account of the determinants of neurotic anxiety. Anxiety is one of the ego's reactions in repudiation of repressed wishes that have become powerful; and its occurrence in dreams as well is very easily explicable when the formation of the dream has been carried out with too much of an eye to the fulfilment of these repressed wishes.

As you see, research into dreams would be justified for its own sake merely by the information it gives us on matters that can with difficulty be discovered in other ways. But we were in fact led to the subject in connection with the psycho-analytic treatment of neurotics. You will easily understand from what I have already said how it is that dream-interpretation, if it is not made too difficult by the patient's resistances, leads to a knowledge of his hidden and repressed wishes and of the complexes nourished by them; and I can now pass on to the third group of mental phenomena whose study has become one of the technical instruments of psycho-analysis.

The phenomena in question are the small faulty actions performed by both normal and neurotic people, to which as a rule no importance is attached: forgetting things that might be known and sometimes in fact are known (e.g. the occasional difficulty in recalling proper names), slips of the tongue in talking, by which we ourselves are so often affected, analogous slips of the pen and misreadings, bungling the performance of actions, losing objects or breaking them. All of these are things for which as a rule no psychological determinants are sought and which are allowed to pass without criticism as consequences of distraction or inattention or similar causes. Besides these there are the actions and gestures which people carry out without noticing them at all, to say nothing of attributing any psychological importance to them: playing about and fiddling with things, humming tunes, fingering parts of one's own body or one's clothing and so on.¹ These small things, faulty actions and symptomatic or haphazard actions alike, are not so insignificant as people, by a sort of conspiracy of silence, are ready to suppose. They always have a meaning, which can usually be interpreted with ease and certainty from the situation in which they occur. And it turns out that once again they give expression to impulses and intentions which have to be kept back and hidden from one's own consciousness, or that they are actually derived from the same repressed wishful impulses and complexes which we have already come to know as the creators of symptoms and the constructors of dreams. They therefore deserve to be rated as symptoms, and if they are examined they may lead, just as dreams do, to the uncovering of the hidden part of the mind. A man's most intimate secrets are as a rule betrayed by their help. If they occur particularly easily and frequently even in healthy people in whom the repression of unconscious impulses has on the whole been quite successful, they have their triviality and inconspicuousness to thank for it. But they can claim a high theoretical value, since they prove that repression and the formation of substitutes occur even under healthy conditions.

¹ Cf. *The Psychopathology of Everyday Life* (1901b).

As you already see, psycho-analysts are marked by a particularly strict belief in the determination of mental life. For them there is nothing trivial, nothing arbitrary or haphazard. They expect in every case to find sufficient motives where, as a rule, no such expectation is raised. Indeed, they are prepared to find *several* motives for one and the same mental occurrence, whereas what seems to be our innate craving for causality declares itself satisfied with a *single* psychical cause.

If you will now bring together the means we possess for uncovering what is concealed, forgotten and repressed in the mind (the study of the ideas occurring to patients under free association, of their dreams and of their faulty and symptomatic actions), and if you will add to these the exploitation of certain other phenomena which occur during psycho-analytic treatment and on which I shall have a few remarks to make later under the heading of 'transference' - if you bear all these in mind, you will agree with me in concluding that our technique is already efficient enough to fulfil its task, to bring the pathogenic psychical material into consciousness and so to get rid of the ailments that have been brought about by the formation of substitutive symptoms. And if, in the course of our therapeutic endeavours, we extend and deepen our knowledge of the human mind both in health and sickness, that can, of course, only be regarded as a peculiar attraction in our work.

You may have formed an impression that the technique through whose armoury I have just conducted you is particularly difficult. In my opinion that technique is entirely in conformity with the material with which it has to deal. But this much at least is clear: it is not a self-evident one and it must be learnt just as the techniques of histology or surgery must be learnt. You will perhaps be surprised to hear that in Europe we have heard a large number of judgements on psycho-analysis from people who know nothing of this technique and do not employ it; and who go on to demand with apparent scorn that we shall prove to them the correctness of our findings. Among these adversaries there are no doubt some to whom a scientific mode of thought is not as a rule alien, who, for instance, would not reject the results of a microscopic examination because it could not be confirmed on the anatomical preparation with the naked eye, but who would first form a judgement on the matter themselves with the help of a microscope. But, where psycho-analysis is concerned, the prospects of recognition are in truth less favourable. Psycho-analysis is seeking to bring to conscious recognition the things in mental life which are repressed; and everyone who forms a judgement on it is himself a human being, who possesses similar repressions and may perhaps be maintaining them with difficulty. They are therefore bound to call up the same resistance in him as in our patients; and that resistance finds it easy to disguise itself as an intellectual rejection and to bring up arguments like those which we ward off in our patients by means of the fundamental rule of psycho-analysis. We often become aware in our opponents, just as we do in our patients, that their power of judgement is very noticeably influenced affectively in the sense of being diminished. The arrogance of consciousness (in rejecting dreams with such contempt, for instance) is one of the most powerful of the devices with which we are provided as a universal protection against the incursion of unconscious complexes. That is why it is so hard to convince people of the reality of the unconscious and to teach them to recognize something new which is in contradiction to their conscious knowledge.

FOURTH LECTURE

LADIES AND GENTLEMEN, - You will want to know now what we have found out about the pathogenic complexes and repressed wishful impulses of neurotics with the help of the technical methods I have described.

First and foremost we have found out one thing. Psycho-analytic research traces back the symptoms of patients' illnesses with really surprising regularity to impressions from their *erotic life*. It shows us that the pathogenic wishful impulses are in the nature of erotic instinctual components; and it forces us to suppose that among the influences leading to the illness the predominant significance must be assigned to erotic disturbances, and that this is the case in both sexes.

I am aware that this assertion of mine will not be willingly believed. Even workers who are ready to follow my psychological studies are inclined to think that I over-estimate the part played by sexual factors; they meet me with the question why *other* mental excitations should not lead to the phenomena I have described of repression and the formation of substitutes. I can only answer that I do not know why they should not, and that I should have no objection to their doing so; but experience shows that they do not carry this weight, that at most they *support* the operation of the sexual factors but cannot replace them. Far from this position having been postulated by me theoretically, at the time of the joint publication of the *Studies* with Dr. Breuer in 1895 I had not yet adopted it; and I was only converted to it when my experiences became more numerous and penetrated into the subject more deeply. There are among my present audience a few of my closest friends and followers, who have travelled with me here to Worcester. Enquire from them, and you will hear that they all began by completely disbelieving my assertion that sexual aetiology was of decisive importance, until their own analytic experiences compelled them to accept it.

A conviction of the correctness of this thesis was not precisely made easier by the behaviour of patients. Instead of willingly presenting us with information about their sexual life, they try to conceal it by every means in their power. People are in general not candid over sexual matters. They do not show their sexuality freely, but to conceal it they wear a heavy overcoat woven of a tissue of lies, as though the weather were bad in the world of sexuality. Nor are they mistaken. It is a fact that sun and wind are not favourable to sexual activity in this civilized world of ours; none of us can reveal his erotism freely to others. But when your patients discover that they can feel quite easy about it while they are under your treatment, they discard this veil of lies, and only then are you in a position to form a judgement on this debatable question. Unluckily even doctors are not preferred above other human creatures in their personal relation to questions of sexual life, and many of them are under the spell of the combination of prudery and prurience which governs the attitude of most 'civilized people' in matters of sexuality.

Let me now proceed with my account of our findings. In another set of cases psycho-analytic investigation traces the symptoms back, it is true, not to sexual experiences but to commonplace traumatic ones. But this distinction loses its significance owing to another circumstance. For the work of analysis required for the thorough explanation and complete recovery of a case never comes to a stop at events that occurred at the time of the onset of the illness, but invariably goes back to the patient's puberty and early childhood; and it is only there that it comes upon the impressions and events which determined the later onset of the illness. It is only experiences in childhood that explain susceptibility to later traumas and it is only by uncovering these almost invariably forgotten memory-traces and by making them conscious that we acquire the power to get rid of the symptoms. And here we reach the same conclusion as in our investigation of dreams: the imperishable, repressed wishful impulses of childhood have alone provided the power for the construction of symptoms, and without them the reaction to later traumas would have taken a normal course. But these powerful wishful impulses of childhood may without exception be described as sexual.

And now at last I am quite certain that I have surprised you. 'Is there such a thing, then, as infantile sexuality?' you will ask 'Is not childhood on the contrary the period of life that is marked by the absence of the sexual instinct?' No, Gentlemen, it is certainly not the case that the sexual instinct enters into children at the age of puberty in the way in which, in the Gospel, the devil entered into the swine. A child has its sexual instincts and activities from the first; it comes into the world with them; and, after an important course of development passing through many stages, they lead to what is known as the normal sexuality of the adult. There is even no difficulty in observing the manifestations of these sexual activities in children; on the contrary, it calls for some skill to overlook them or explain them away.

By a lucky chance I am in a position to call a witness in favour of my assertions from your very midst. I have here in my hand a paper written by a Dr. Sanford Bell, which was published in *The American Journal of Psychology* in 1902. The author is a Fellow of Clark University, of the very institution in whose lecture-room we are now assembled. In this work, which is entitled 'A Preliminary Study of the Emotion of Love between the Sexes', and which appeared three years before my *Three Essays on the Theory of Sexuality*, the author says exactly what I have just told you: 'The emotion of sex-love . . . does not make its appearance for the first time at the period of adolescence, as has been thought.' He carried out his work in what we in Europe would call 'the American manner', collecting no fewer than 2,500 positive observations in the course of fifteen years, among them 800 of his own. Concerning the signs by which these instances of falling in love are revealed he writes as follows: 'The unprejudiced mind in observing these manifestations in hundreds of couples of children cannot escape referring them to sex origin. The most exacting mind is satisfied when to these observations are added the confessions of those who have, as children, experienced the emotion to a marked degree of intensity and whose memories of childhood are relatively distinct.' But those of you who do not wish to believe in infantile sexuality will be most of all surprised to hear that not a few of these children who have fallen in love so early are of the tender age of three, four and five.

It would not astonish me if you were to attach more credence to these observations made by one of your closest neighbours than to mine. I myself have recently been fortunate enough to obtain a fairly complete picture of the somatic instinctual manifestations and mental products at an early stage of a child's erotic life from the analysis of a five-year-old boy, suffering from anxiety - an analysis carried out with a correct technique by his own father.¹ And I may remind you that only a few hours ago, in this same room, my friend Dr. C. G. Jung reported an observation to you made on a still younger girl who, with a precipitating cause similar to my patient's (the birth of a younger child in the family), made it possible to infer with certainty the presence of almost the same sensual impulses, wishes and complexes. I do not despair, therefore, of your becoming reconciled to what seems at first sight the strange idea of infantile sexuality. And I should like to quote to you the praiseworthy example of the Zurich psychiatrist, Dr. E. Bleuler, who declared publicly not many years ago that he was 'unable to comprehend my theories of sexuality', and who has since then confirmed the existence of infantile sexuality to its full extent from his own observations. (Cf. Bleuler, 1908.)

It is only too easy to explain why most people (whether medical observers or others) will hear nothing of the sexual life of children. They have forgotten their own infantile sexual activity under the pressure of their education to a civilized life, and they do not wish to be reminded of what has been repressed. They would arrive at other convictions if they were to begin their enquiry with a self-analysis, a revision and interpretation of their childhood memories.

¹ 'The Analysis of a Phobia in a Five-Year-Old Boy'.

Put away your doubts, then, and join me in a consideration of infantile sexuality from the earliest age.¹ A child's sexual instinct turns out to be put together out of a number of factors; it is capable of being divided up into numerous components which originate from various sources. Above all, it is still independent of the reproductive function, into the service of which it will later be brought. It serves for the acquisition of different kinds of pleasurable feeling, which, basing ourselves on analogies and connections, we bring together under the idea of sexual pleasure. The chief source of infantile sexual pleasure is the appropriate excitation of certain parts of the body that are especially susceptible to stimulus: apart from the genitals, these are the oral, anal and urethral orifices, as well as the skin and other sensory surfaces. Since at this first phase of infantile sexual life satisfaction is obtained from the subject's own body and extraneous objects are disregarded, we term this phase (from a word coined by Havelock Ellis) that of *auto-erotism*. We call the parts of the body that are important in the acquisition of sexual pleasure 'erotogenic zones'. Thumb-sucking (or sensual sucking) in the youngest infants is a good example of this auto-erotic satisfaction from an erotogenic zone. The first scientific observer of this phenomenon, a paediatrician in Budapest named Lindner (1879), already interpreted it correctly as sexual satisfaction and described exhaustively its transition to other and higher forms of sexual activity. Another sexual satisfaction at this period of life is the masturbatory excitation of the genitals, which retains so much importance in later life and by many people is never completely conquered. Alongside these and other auto-erotic activities, we find in children at a very early age manifestations of those instinctual components of sexual pleasure (or, as we like to say, of libido) which presuppose the taking of an extraneous person as an object. These instincts occur in pairs of opposites, active and passive. I may mention as the most important representatives of this group the desire to cause pain (sadism) with its passive counterpart (masochism) and the active and passive desire for looking, from the former of which curiosity branches off later on and from the latter the impulsion to artistic and theatrical display. Others of a child's sexual activities already imply the making of an 'object-choice', where an extraneous person becomes the main feature, a person who owes his importance in the first instance to considerations arising from the self-preservative instinct. But at this early period of childhood difference in sex plays no decisive part as yet. Thus you can attribute some degree of homosexuality to every child without doing him an injustice. This widespread and copious but dissociated sexual life of children, in which each separate instinct pursues its own acquisition of pleasure independently of all the rest, is now brought together and organized in two main directions, so that by the end of puberty the individual's final sexual character is as a rule completely formed. On the one hand, the separate instincts become subordinated to the dominance of the genital zone, so that the whole sexual life enters the service of reproduction, and the satisfaction of the separate instincts retains its importance only as preparing for and encouraging the sexual act proper. On the other hand, object-choice pushes auto-erotism into the background, so that in the subject's erotic life all the components of the sexual instinct now seek satisfaction in relation to the person who is loved. Not all of the original sexual components, however, are admitted to take part in this final establishment of sexuality. Even before puberty extremely energetic repressions of certain instincts have been effected under the influence of education, and mental forces such as shame, disgust and morality have been set up, which, like watchmen, maintain these repressions. So that when at puberty the high tide of sexual demands is reached, it is met by these mental reactive or resistant structures like dams, which direct its flow into what are called normal channels and make it impossible for it to reactivate the instincts that have undergone repression. It is in particular the coprophilic impulses of childhood - that is to say, the desires attaching to the excreta - which are submitted the most rigorously to repression, and the same is true, furthermore, of fixation to the figures to which the child's original object-choice was attached.

¹ Cf. *Three Essays on the Theory of Sexuality* (1905d).

There is a dictum in general pathology, Gentlemen, which asserts that every developmental process carries with it the seed of a pathological disposition, in so far as that process may be inhibited, delayed, or may run its course incompletely. The same thing is true of the highly complicated development of the sexual function. It does not occur smoothly in every individual; and, if not, it leaves behind it either abnormalities or a predisposition to fall ill later, along the path of involution (i.e. regression). It may happen that not all the component instincts submit to the dominance of the genital zone. An instinct which remains in this way independent leads to what we describe as a *perversion*, and may substitute its own sexual aim for the normal one. It very often happens, as I have already said, that auto-erotism is not completely conquered, and evidence of this is given by a great variety of subsequent disturbances. The originally equal value attached to the two sexes as sexual objects may persist, and this will lead to a tendency in adult life to homosexual activity, which can in certain circumstances be intensified into exclusive homosexuality. These classes of disturbance represent direct inhibitions in the development of the sexual function; they comprise the perversions and, what is by no means rare, general infantilism in sexual life.

The predisposition to *neurosis* is traceable to impaired sexual development in a different way. Neuroses are related to perversions as negative to positive. The same instinctual components as in the perversions can be observed in the neuroses as vehicles of complexes and constructors of symptoms, but in the latter case they operate from the unconscious. Thus they have undergone repression, but have been able, in defiance of it, to persist in the unconscious. Psycho-analysis makes it clear that an excessively strong manifestation of these instincts at a very early age leads to a kind of partial *fixation*, which then constitutes a weak point in the structure of the sexual function. If in maturity the performance of the normal sexual function comes up against obstacles, the repression that took place during the course of development will be broken through at the precise points at which the infantile fixations occurred.

But here you will perhaps protest that all this is not sexuality. I have been using the word in a far wider sense than that in which you have been accustomed to understand it. So much I am quite ready to grant you. But the question arises whether it is not rather you who have been using the word in far too narrow a sense by restricting it to the sphere of reproduction. It means that you are sacrificing an understanding of the perversions and the connection between the perversions, the neuroses and normal sexual life; and you are making it impossible for you to recognize in its true significance the easily observable beginnings of the somatic and mental erotic life of children. But however you may choose to decide the verbal usage, you should bear firmly in mind that psycho-analysts understand sexuality in the full sense to which one is led by a consideration of infantile sexuality.

Let us return to the sexual development of children. We have some arrears to make up owing to our having paid more attention to the somatic than to the mental phenomena of sexual life. The child's first choice of an object, which derives from its need for help, claims our further interest. Its choice is directed in the first instance to all those who look after it, but these soon give place to its parents. Children's relations to their parents, as we learn alike from direct observations of children and from later analytic examination of adults, are by no means free from elements of accompanying sexual excitation. The child takes both of its parents, and more particularly one of them, as the object of its erotic wishes. In so doing, it usually follows some indication from its parents, whose affection bears the clearest characteristics of a sexual activity, even though of one that is inhibited in its aims. As a rule a father prefers his daughter and a mother her son; the child reacts to this by wishing, if he is a son, to take his father's place, and, if she is a daughter, her mother's. The feelings which are aroused in these relations between parents and children and in the resulting ones between brothers and sisters are not only of a positive or affectionate kind but also of a negative or hostile one. The complex which is thus formed is doomed to early repression; but it continues to exercise a great and lasting influence from the unconscious. It is to be suspected that, together with its extensions, it constitutes the *nuclear complex* of every neurosis, and we may expect to find it no less actively at work in other regions of mental life. The myth of King Oedipus, who killed his father and took his mother to wife, reveals, with little modification, the infantile wish, which is later opposed and repudiated by the *barrier against incest*. Shakespeare's *Hamlet* is equally rooted in the soil of the incest-complex, but under a better disguise.

During the time when the child is dominated by the still unrepressed nuclear complex, an important part of his intellectual activity is brought into the service of his sexual interests. He begins to enquire where babies come from, and, on the basis of the evidence presented to him, guesses more of the true facts than the grown-ups imagine. His interest in these researches is usually set going by the very real threat offered to him by the arrival of a new baby, which to begin with he regards merely as a competitor. Under the influence of the component instincts that are active in himself, he arrives at a number of 'infantile sexual theories' - such as attributing a male genital organ to both sexes alike, or supposing that babies are conceived by eating and born through the end of the bowel, or regarding sexual intercourse as a hostile act, a kind of violent subjugation. But as a result precisely of the incompleteness of his sexual constitution, and of the gap in his knowledge due to the hidden nature of the female sexual channel, the young investigator is obliged to abandon his work as a failure. The fact of this childish research itself, as well as the different infantile sexual theories that it brings to light, remain of importance in determining the formation of the child's character and the content of any later neurotic illness.

It is inevitable and perfectly normal that a child should take his parents as the first objects of his love. But his libido should not remain fixated to these first objects; later on, it should merely take them as a model, and should make a gradual transition from them on to extraneous people when the time for the final choice of an object arrives. The detachment of the child from his parents is thus a task that cannot be evaded if the young individual's social fitness is not to be endangered. During the time at which repression is making its selection among the component instincts, and later, when there should be a slackening of the parents' influence, which is essentially responsible for the expenditure of energy on these repressions, the task of education meets with great problems, which at the present time are certainly not always dealt with in an understanding and unobjectionable manner.

You must not suppose, Ladies and Gentlemen, that these discussions on sexual life and the psychosexual development of children have led us too far from psycho-analysis and the problem of curing nervous disorders. You can, if you like, regard psycho-analytic treatment as no more than a prolongation of education for the purpose of overcoming the residues of childhood.

FIFTH LECTURE

LADIES AND GENTLEMEN, - With the discovery of infantile sexuality and the tracing back of neurotic symptoms to erotic instinctual components we have arrived at some unexpected formulas concerning the nature and purposes of neurotic illnesses. We see that human beings fall ill when, as a result of external obstacles or of an internal lack of adaptation, the satisfaction of their erotic needs *in reality* frustrated. We see that they then take flight into *illness* in order that by its help they may find a satisfaction to take the place of what has been frustrated. We recognize that the pathological symptoms constitute a portion of the subject's sexual activity or even the whole of his sexual life, and we find that the withdrawal from reality is the main purpose of the illness but also the main damage caused by it. We suspect that our patients' resistance to recovery is no simple one, but compounded of several motives. Not only does the patient's ego rebel against giving up the repressions by means of which it has risen above its original disposition, but the sexual instincts are unwilling to renounce their substitutive satisfaction so long as it is uncertain whether reality will offer them anything better.

The flight from unsatisfactory reality into what, on account of the biological damage involved, we call illness (though it is never without an immediate yield of pleasure to the patient) takes place along the path of involution, of regression, of a return to earlier phases of sexual life, phases from which at one time satisfaction was not withheld. This regression appears to be a twofold one: a *temporal* one, in so far as the libido, the erotic needs, hark back to stages of development that are earlier in time, and a *formal* one, in that the original and primitive methods of psychical expression are employed in manifesting those needs. Both these kinds of regression, however, lead back to childhood and unite in bringing about an infantile condition of sexual life.

The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in which we like to make up for the insufficiencies of reality by the production of wish-fulfilments. These phantasies include a great deal of the true constitutional essence of the subject's personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject's own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an *artistic gift* (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. To-day neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it.

Let me at this point state the principal finding to which we have been led by the psycho-analytic investigation of neurotics. The neuroses have no psychical content that is peculiar to them and that might not equally be found in healthy people. Or, as Jung has expressed it, neurotics fall ill of the same complexes against which we healthy people struggle as well. Whether that struggle ends in health, in neurosis, or in a countervailing superiority of achievement, depends on *quantitative* considerations, on the relative strength of the conflicting forces.

I have not yet told you, Ladies and Gentlemen, of the most important of the observations which confirm our hypothesis of the sexual instinctual forces operating in neuroses. In every psycho-analytic treatment of a neurotic patient the strange phenomenon that is known as 'transference' makes its appearance. The patient, that is to say, directs towards the physician a degree of affectionate feeling (mingled, often enough, with hostility) which is based on no real relation between them and which - as is shown by every detail of its emergence - can only be traced back to old wishful phantasies of the patient's which have become unconscious. Thus the part of the patient's emotional life which he can no longer recall to memory is re-experienced by him in his relation to the physician; and it is only this re-experiencing in the 'transference' that convinces him of the existence and of the power of these unconscious sexual impulses. His symptoms, to take an analogy from chemistry, are precipitates of earlier experiences in the sphere of love (in the widest sense of the word), and it is only in the raised temperature of his experience of the transference that they can be resolved and reduced to other psychical products. In this reaction the physician, if I may borrow an apt phrase from Ferenczi (1909), plays the part of a catalytic ferment, which temporarily attracts to itself the affects liberated in the process. A study of transference, too, can give you the key to an understanding of hypnotic suggestion, which we employed to begin with as a technical method for investigating the unconscious in our patients. At that time hypnosis was found to be a help therapeutically, but a hindrance to the scientific understanding of the facts; for it cleared away the psychical resistances in a certain area while building them up into an unscalable wall at its frontiers. You must not suppose, moreover, that the phenomenon of transference (of which, unfortunately, I can tell you all too little to-day) is *created* by psycho-analytic influence. Transference arises spontaneously in all human relationships just as it does between the patient and the physician. It is everywhere the true vehicle of therapeutic influence; and the less its presence is suspected, the more powerfully it operates. So psycho-analysis does not create it, but merely reveals it to consciousness and gains control of it in order to guide psychical processes towards the desired goal. I cannot, however, leave the topic of transference without stressing the fact that this phenomenon plays a decisive part in bringing conviction not only to the patient but also to the physician. I know it to be true of all my followers that they were only convinced of the correctness of my assertions on the pathogenesis of the neuroses by their experiences with transference; and I can very well understand that such certainty of judgement cannot be attained before one has carried out psycho-analyses and has oneself observed the workings of transference.

Ladies and Gentlemen, from the intellectual point of view we must, I think, take into account two special obstacles to recognizing psycho-analytic trains of thought. In the first place, people are unaccustomed to reckoning with a strict and universal application of determinism to mental life; and in the second place, they are ignorant of the peculiarities which distinguish unconscious mental processes from the conscious ones that are familiar to us. One of the most widespread resistances to psycho-analytic work, in the sick and healthy alike, can be traced to the second of these two factors. People are afraid of doing harm by psycho-analysis; they are afraid of bringing the repressed sexual instincts into the patient's consciousness, as though that involved a danger of their overwhelming his higher ethical trends and of their robbing him of his cultural acquisitions. People notice that the patient has sore spots in his mind, but shrink from touching them for fear of increasing his sufferings. We can accept this analogy. It is no doubt kinder not to touch diseased spots if it can do nothing else but cause pain. But, as we know, a surgeon does not refrain from examining and handling a focus of disease, if he is intending to take active measures which he believes will lead to a permanent cure. No one thinks of blaming him for the inevitable suffering caused by the examination or for the reactions to the operation, if only it gains its end and the patient achieves a lasting recovery as a result of the temporary worsening of his state. The case is similar with psycho-analysis. It may make the same claims as surgery: the increase in suffering which it causes the patient during treatment is incomparably less than what a surgeon causes, and is quite negligible in proportion to the severity of the underlying ailment. On the other hand, the final outcome that is so much dreaded - the destruction of the patient's cultural character by the instincts which have been set free from repression - is totally impossible. For alarm on this score takes no account of what our experiences have taught us with certainty - namely that the mental and somatic power of a wishful impulse, when once its repression has failed, is far stronger if it is unconscious than if it is conscious; so that to make it conscious can only be to weaken it. An unconscious wish cannot be influenced and it is independent of any contrary tendencies, whereas a conscious one is inhibited by whatever else is conscious and opposed to it. Thus the work of psycho-analysis puts itself at the orders of precisely the highest and most valuable cultural trends, as a better substitute for the unsuccessful repression.

What, then, becomes of the unconscious wishes which have been set free by psycho-analysis? Along what paths do we succeed in making them harmless to the subject's life? There are several such paths. The most frequent outcome is that, while the work is actually going on, these wishes are destroyed by the rational mental activity of the better impulses that are opposed to them. *Repression* is replaced by a *condemning judgement* carried out along the best lines. That is possible because what we have to get rid of is to a great extent only the consequences arising from earlier stages of the ego's development. The subject only succeeded in the past in repressing the unserviceable instinct because he himself was at that time still imperfectly organized and feeble. In his present-day maturity and strength, he will perhaps be able to master what is hostile to him with complete success.

A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called '*sublimation*', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the *sexual* instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more.

We must not omit to consider the third of the possible outcomes of the work of psycho-analysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion.

It may be that you for your part will regard the warning with which I close as an exaggeration. I shall only venture on an indirect picture of my conviction by telling you an old story and leaving you to make what use you like of it. German literature is familiar with a little town called Schilda, to whose inhabitants clever tricks of every possible sort are attributed. The citizens of Schilda, so we are told, possessed a horse with whose feats of strength they were highly pleased and against which they had only one objection - that it consumed such a large quantity of expensive oats. They determined to break it of this bad habit very gently by reducing its ration by a few stalks every day, till they had accustomed it to complete abstinence. For a time things went excellently: the horse was weaned to the point of eating only one stalk a day, and on the succeeding day it was at length to work without any oats at all. On the morning of that day the spiteful animal was found dead; and the citizens of Schilda could not make out what it had died of.

We should be inclined to think that the horse was starved and that no work at all could be expected of an animal without a certain modicum of oats.

I must thank you for your invitation and for the attention with which you have listened to me.

LEONARDO DA VINCI AND A MEMORY OF HIS CHILDHOOD

LEONARDO DA VINCI AND A MEMORY OF HIS CHILDHOOD

I

When psychiatric research, normally content to draw on frailer men for its material, approaches one who is among the greatest of the human race, it is not doing so for the reasons so frequently ascribed to it by laymen. 'To blacken the radiant and drag the sublime into the dust' is no part of its purpose, and there is no satisfaction for it in narrowing the gulf which separates the perfection of the great from the inadequacy of the objects that are its usual concern. But it cannot help finding worthy of understanding everything that can be recognized in those illustrious models, and it believes there is no one so great as to be disgraced by being subject to the laws which govern both normal and pathological activity with equal cogency.

Leonardo da Vinci (1452-1519) was admired even by his contemporaries as one of the greatest men of the Italian renaissance; yet in their time he had already begun to seem an enigma, just as he does to us to-day. He was a universal genius 'whose outlines can only be surmised, - never defined'.¹ In his own time his most decisive influence was in painting, and it was left to us to recognize the greatness of the natural scientist (and engineer) that was combined in him with the artist. Though he left behind him masterpieces of painting, while his scientific discoveries remained unpublished and unused, the investigator in him never in the course of his development left the artist entirely free, but often made severe encroachments on him and perhaps in the end suppressed him. In the last hour of his life, according to the words that Vasari gives him, he reproached himself with having offended God and man by his failure to do his duty in his art.² And even if this story of Vasari's has neither external nor much internal probability but belongs to the legend which began to be woven around the mysterious Master even before his death, it is still of incontestable value as evidence of what men believed at the time.

¹ The words are Jacob Burckhardt's, quoted by Konstantinowa (1907).

² 'Egli per reverenza, rizzatosi a sedere sul letto, contando il mal suo e gli accidenti di quello, mostrava tuttavia quanto avea offeso Dio e gli uomini del mondo, non avendo operato nell' arte come si conveniva.' ['He having raised himself out of reverence so as to sit on the bed, and giving an account of his illness and its circumstances, yet showed how much he had offended God and mankind in not having worked at his art as he should have done.'] Vasari.

What was it that prevented Leonardo's personality from being understood by his contemporaries? The cause of this was certainly not the versatility of his talents and the range of his knowledge, which enabled him to introduce himself to the court of the Duke of Milan, Lodovico Sforza, called Il Moro, as a performer on a kind of lute of his own invention, or allowed him to write the remarkable letter to the same duke in which he boasted of his achievements as architect and military engineer. For the days of the renaissance were quite familiar with such a combination of wide and diverse abilities in a single individual - though we must allow that Leonardo himself was one of the most brilliant examples of this. Nor did he belong to the type of genius who has received a niggardly outward endowment from nature, and who in his turn places no value on the outward forms of life, but in a spirit of painful gloom flies from all dealings with mankind. On the contrary, he was tall and well proportioned; his features were of consummate beauty and his physical strength unusual; he was charming in his manner, supremely eloquent, and cheerful and amiable to everyone. He loved beauty in the things that surrounded him; he was fond of magnificent clothing and valued every refinement of living. In a passage from the treatise on painting, which reveals his lively capacity for enjoyment, he compares painting with its sister arts and describes the hardships that await the sculptor: 'For his face is smeared and dusted all over with marble powder so that he looks like a baker, and he is completely covered with little chips of marble, so that it seems as if his back had been snowed on; and his house is full of splinters of stone and dust. In the case of the painter it is quite different... for the painter sits in front of his work in perfect comfort. He is well-dressed and handles the lightest of brushes which he dips in pleasant colours. He wears the clothes he likes; and his house is full of delightful paintings, and is spotlessly clean. He is often accompanied by music or by men who read from a variety of beautiful works, and he can listen to these with great pleasure and without the din of hammers and other noises.'¹

¹ *Trattato della Pittura.*

It is indeed quite possible that the idea of a radiantly happy and pleasure-loving Leonardo is only applicable to the first and longer period of the artist's life. Afterwards, when the downfall of Lodovico Moro's rule forced him to leave Milan, the city that was the centre of his activity and where his position was assured, and to pursue a life lacking in security and not rich in external successes, until he found his last asylum in France, the sparkle of his temperament may have grown dim and some strange sides of his nature may have been thrown into prominence. Moreover the turning of his interests from his art to science, which increased as time went on, must have played its part in widening the gulf between himself and his contemporaries. All the efforts in which in their opinion he frittered away his time when he could have been industriously painting to order and becoming rich (as, for example, his former fellow-student Perugino did) seemed to them to be merely capricious trifling or even caused him to be suspected of being in the service of the 'black art'. We are in a position to understand him better, for we know from his notes what were the arts that he practised. In an age which was beginning to replace the authority of the Church by that of antiquity and which was not yet familiar with any form of research not based on presuppositions, Leonardo - the forerunner and by no means unworthy rival of Bacon and Copernicus - was necessarily isolated. In his dissection of the dead bodies of horses and human beings, in his construction of flying machines, and in his studies on the nutrition of plants and their reactions to poisons, he certainly departed widely from the commentators on Aristotle, and came close to the despised alchemists, in whose laboratories experimental research had found some refuge at least in those unfavourable times.

The effect that this had on his painting was that he took up his brush with reluctance, painted less and less, left what he had begun for the most part unfinished and cared little about the ultimate fate of his works. And this was what he was blamed for by his contemporaries: to them his attitude towards his art remained a riddle.

Several of Leonardo's later admirers have made attempts to acquit his character of the flaw of instability. In his defence they claim that he is blamed for what is a general feature of great artists: even the energetic Michelangelo, a man entirely given up to his labours, left many of his works incomplete, and it was no more his fault than it was Leonardo's in the parallel instance. Moreover, in the case of some of the pictures, they urge, it is not so much a question of their being unfinished as of his declaring them to be so. What appears to the layman as a masterpiece is never for the creator of the work of art more than an unsatisfactory embodiment of what he intended; he has some dim notion of a perfection, whose likeness time and again he despairs of reproducing. Least of all, they claim, is it right to make the artist responsible for the ultimate fate of his works.

Valid as some of these excuses may be, they still do not cover the whole state of affairs that confronts us in Leonardo. The same distressing struggle with a work, the final flight from it and the indifference to its future fate may recur in many other artists, but there is no doubt that this behaviour is shown in Leonardo in an extreme degree. Solmi (1910, 12) quotes the remark of one of his pupils: 'Pareva che ad ogni ora tremasse, quando si poneva a dipingere, e però non diede mai fine ad alcuna cosa cominciata, considerando la grandezza dell'arte, tal che egli scorgeva errori in quelle cose, che ad altri parevano miracoli.'¹ His last pictures, he goes on, the Leda, the Madonna di Sant' Onofrio, Bacchus, and the young St. John the Baptist, remained unfinished 'come quasi intervenne di tutte le cose sue . . .'² Lomazzo, who made a copy of the Last Supper, refers in a sonnet to Leonardo's notorious inability to finish his works:

Protagon che il pennel di sue pitture
Non levava, agguaglio il Vinci Divo
Di cui opra non è finita pure.³

¹ ['He appeared to tremble the whole time when he set himself to paint, and yet he never completed any work he had begun, having so high a regard for the greatness of art that he discovered faults in things that to others seemed miracles.']

² ['As happened more or less to all his works.']

³ ['Protagenes, who never lifted his brush from his work, was the equal of the divine Vinci, who never finished anything at all.'] Quoted by Scognamiglio (1900).

The slowness with which Leonardo worked was proverbial. He painted at the Last Supper in the Convent of Santa Maria delle Grazie in Milan, after the most thorough preparatory studies, for three whole years. One of his contemporaries, Matteo Bandelli, the story-writer, who at the time was a young monk in the convent, tells how Leonardo often used to climb up the scaffolding early in the morning and remain there till twilight never once laying his brush aside, and with no thought of eating or drinking. Then days would pass without his putting his hand to it. Sometimes he would remain for hours in front of the painting, merely examining it in his mind. At other times he would come straight to the convent from the court in the castle at Milan, where he was making the model of the equestrian statue for Francesco Sforza, in order to add a few strokes of the brush to a figure, and then immediately break off.¹ According to Vasari he spent four years in painting the portrait of Mona Lisa, the wife of the Florentine Francesco del Giocondo, without being able to bring it to final completion. This circumstance may also account for the fact that the picture was never delivered to the man who commissioned it, but instead remained with Leonardo and was taken to France by him.² It was bought by King Francis I, and to-day forms one of the greatest treasures of the Louvre.

If these reports of the way in which Leonardo worked are compared with the evidence of the extraordinarily numerous sketches and studies which he left behind him and which exhibit every *motif* appearing in his paintings in a great variety of forms, we are bound totally to reject the idea that traits of hastiness and unsteadiness acquired the slightest influence over Leonardo's relation to his art. On the contrary, it is possible to observe a quite extraordinary profundity, a wealth of possibilities between which a decision can only be reached with hesitation, demands which can hardly be satisfied, and an inhibition in the actual execution which is not in fact to be explained even by the artist inevitably falling short of his ideal. The slowness which had all along been conspicuous in Leonardo's work is seen to be a symptom of this inhibition and to be the forerunner of his subsequent withdrawal from painting.³ It was this too which determined the fate of the Last Supper - a fate that was not undeserved. Leonardo could not become reconciled to fresco painting, which demands rapid work while the ground is still moist, and this was the reason why he chose oil colours, the drying of which permitted him to protract the completion of the painting to suit his mood and leisure. These pigments however detached themselves from the ground on which they were applied and which separated them from the wall. Added to this, the defects in the wall, and the later fortunes of the building itself, determined what seems to be the inevitable ruin of the picture.⁴

¹ Von Seidlitz (1909, 1, 203).

² Von Seidlitz (1909, 2, 48).

³ Pater: 'But it is certain that at one period of his life he had almost ceased to be an artist.'

⁴ See von Seidlitz (1909, 1) for the history of the attempts to restore and preserve the picture.

The miscarriage of a similar technical experiment appears to have caused the destruction of the Battle of Anghiari, the painting which, in competition with Michelangelo, he began to paint some time afterwards on a wall of the Sala del Consiglio in Florence, and which he also abandoned in an unfinished condition. Here it seems as if an alien interest - in experimentation - at first reinforced the artistic one, only to damage the work later on.

The character of Leonardo the man showed some other unusual traits and apparent contradictions. A certain inactivity and indifference seemed obvious in him. At a time when everyone was trying to gain the widest scope for his activity - a goal unattainable without the development of energetic aggressiveness towards other people - Leonardo was notable for his quiet peaceableness and his avoidance of all antagonism and controversy. He was gentle and kindly to everyone; he declined, it is said, to eat meat, since he did not think it justifiable to deprive animals of their lives; and he took particular pleasure in buying birds in the market and setting them free.¹ He condemned war and bloodshed and described man as not so much the king of the animal world but rather the worst of the wild beasts.² But this feminine delicacy of feeling did not deter him from accompanying condemned criminals on their way to execution in order to study their features distorted by fear and to sketch them in his notebook. Nor did it stop him from devising the cruellest offensive weapons and from entering the service of Cesare Borgia as chief military engineer. He often gave the appearance of being indifferent to good and evil, or he insisted on measurement by a special standard. He accompanied Cesare in a position of authority during the campaign that brought the Romagna into the possession of that most ruthless and faithless of adversaries. There is not a line in Leonardo's notebooks which reveals any criticism of the events of those days, or any concern in them. A comparison suggests itself here with Goethe during the French campaign.

¹ Müntz (1899, 18). A letter of a contemporary from India to one of the Medici alludes to this characteristic behaviour of Leonardo. (See J. P. Richter.)

² Bottazzi (1910, 186).

If a biographical study is really intended to arrive at an understanding of its hero's mental life it must not - as happens in the majority of biographies as a result of discretion or prudishness - silently pass over its subject's sexual activity or sexual individuality. What is known of Leonardo in this respect is little: but that little is full of significance. In an age which saw a struggle between sensuality without restraint and gloomy asceticism, Leonardo represented the cool repudiation of sexuality - a thing that would scarcely be expected of an artist and a portrayer of feminine beauty. Solmi quotes the following sentence of his which is evidence of his frigidity: 'The act of procreation and everything connected with it is so disgusting that mankind would soon die out if it were not an old-established custom and if there were not pretty faces and sensuous natures.'¹ His posthumous writings, which not only deal with the greatest scientific problems but also contain trivialities that strike us as scarcely worthy of so great a mind (an allegorical natural history, animal fables, jokes, prophecies),² are chaste - one might say even abstinent - to a degree that would cause surprise in a work of *belles lettres* even to-day. So resolutely do they shun everything sexual that it would seem as if Eros alone, the preserver of all living things, was not worthy material for the investigator in his pursuit of knowledge.³ It is well known how frequently great artists take pleasure in giving vent to their phantasies in erotic and even crudely obscene pictures. In Leonardo's case on the contrary we have only some anatomical sketches of the internal female genitals, the position of the embryo in the womb and so on.⁴

¹ Solmi (1908).

² Herzfeld (1906).

³ An exception to this (though an unimportant one) is perhaps to be found in his collected witticisms - *belle facezie* - which have not been translated. See Herzfeld (1906, 151).

⁴ [Footnote added 1919:] Some remarkable errors are visible in a drawing made by Leonardo of the sexual act seen in anatomical sagittal section, which certainly cannot be called obscene. They were discovered by Reitler (1917) and discussed by him in the light of the account which I have given here of Leonardo's character:

'It is precisely in the process of portraying the act of procreation that this excessive instinct for research has totally failed - obviously only as a result of his even greater sexual repression. The man's body is drawn in full, the woman's only in part. If the drawing reproduced in Fig. 1 is shown to an unprejudiced onlooker with the head visible but all the lower parts covered up, it may be safely assumed that the head will be taken to be a woman's. The wavy locks on the forehead, and the others, which flow down the back approximately to the fourth or fifth dorsal vertebra, mark the head as more of a woman's than a man's.

'The woman's breast reveals two defects. The first indeed is an artistic one, for its outline gives it the appearance of a breast that is flabby and hangs down unpleasingly. The second defect is anatomical, for Leonardo the researcher had obviously been prevented by his fending off of sexuality from ever making a close examination of a nursing woman's nipples. Had he done so he would have been bound to notice that the milk flows out of a number of separate excretory ducts. Leonardo, however, drew only a single duct extending far down into the abdominal cavity and probably in his view drawing the milk from the *cisterna chyli* and perhaps also connected in some way with the sex organs. It must of course be taken into consideration that the study of the internal organs of the human body was at that time made extremely difficult, since the dissection of bodies was regarded as desecration of the dead and was most severely punished. Whether Leonardo, who had certainly only very little material for dissection at his disposal, knew anything at all of the existence of a lymph-reservoir in the abdominal cavity is therefore in fact highly questionable, although in his drawing he included a cavity that is no doubt intended to be something of the sort. But from his making the lactiferous duct extend still further downwards till it reaches the internal sex organs we may suspect that he was trying to represent the synchronization of the beginning of the secretion of milk and the end of pregnancy by means of visible anatomical connections as well. However, even if we are ready to excuse the artist's defective knowledge of anatomy by referring it to the circumstances of his time, the striking fact still remains that it is precisely the female genital that Leonardo has treated so carelessly. The vagina and something that looks like the *portio uteri* can no doubt be made out, but the lines indicating the uterus itself are completely confused.

Fig. 1

'The male genital on the other hand is depicted by Leonardo much more correctly. Thus, for instance, he was not satisfied with drawing the testis but also put in the epididymis, which he drew with perfect accuracy.

'What is especially remarkable is the posture in which Leonardo makes coitus take place. Pictures and drawings by famous artists exist which depict *coitus a tergo*, *a latere*, etc., but when it comes to a drawing of the sexual act being performed standing up, we must surely suppose that there was a sexual repression of quite special strength to have caused it to be represented in this isolated and almost grotesque way. If one wants to enjoy oneself it is usual to make oneself as comfortable as possible: this of course is true for both the primal instincts, hunger and love. Most of the peoples of antiquity took their meals in a lying position and it is normal in coitus to-day to lie down just as comfortably as did our ancestors. Lying down implies more or less a wish to stay in the desired situation for some time.

'Moreover the features of the man with the feminine head are marked by a resistance that is positively indignant. His brows are wrinkled and his gaze is directed sideways with an expression of repugnance. The lips are pressed together and their corners are then drawn down. In this face can be seen neither the pleasure of love's blessings nor the happiness of indulgence: it expresses only indignation and aversion.

'The clumsiest blunder, however, was made by Leonardo in drawing the two lower extremities. The man's foot should in point of fact have been his right one; for since Leonardo depicted the act of union in an anatomical sagittal section it follows of course that the man's left foot would be above the plane of the picture. Conversely, and for the same reason, the woman's foot should have belonged to her left side. But in fact Leonardo has interchanged male and female. The male figure has a left foot and the female one a right foot. This interchange is easiest to grasp if one recalls that the big toes lie on the inner sides of the feet.

'This anatomical drawing alone would have made it possible to deduce the repression of libido - a repression which threw the great artist and investigator into something approaching confusion.'

[Added 1923:] These remarks of Reitler's have been criticized, it is true, on the ground that such serious conclusions should not be drawn from a hasty sketch, and that it is not even certain whether the different parts of the drawing really belong together.

It is doubtful whether Leonardo ever embraced a woman in passion; nor is it known that he had any intimate mental relationship with a woman, such as Michelangelo's with Vittoria Colonna. While he was still an apprentice, living in the house of his master Verrocchio, a charge of forbidden homosexual practices was brought against him, along with some other young people, which ended in his acquittal. He seems to have fallen under this suspicion because he had employed a boy of bad reputation as a model.¹ When he had become a Master, he surrounded himself with handsome boys and youths whom he took as pupils. The last of these pupils, Francesco Melzi, accompanied him to France, remained with him up to his death and was named by him as his heir. Without sharing in the certainty of his modern biographers, who naturally reject the possibility that there was a sexual relationship between him and his pupils as a baseless insult to the great man, we may take it as much more probable that Leonardo's affectionate relations with the young men who - as was the custom with pupils at that time - shared his existence did not extend to sexual activity. Moreover a high degree of sexual activity is not to be attributed to him.

¹ According to Scognamiglio (1900, 49) there is a reference to this episode in an obscure and even variously read passage in the Codex Atlanticus: 'Quando io feci Domeneddio putto voi mi metteste in prigione, ora s'io lo fo grande, voi mi farete peggio.' ['When I represented the Lord God as a baby, you put me in prison; now if I represent him as an adult you will do worse to me. ']

There is only one way in which the peculiarity of this emotional and sexual life can be understood in connection with Leonardo's double nature as an artist and as a scientific investigator. Among his biographers, to whom a psychological approach is often very alien, there is to my knowledge only one, Edmondo Solmi, who has approached the solution of the problem; but a writer who has chosen Leonardo as the hero of a great historical novel, Dmitry Sergeyevich Merezhkovsky, has made a similar reading of this unusual man the basis of his portrait and has given clear expression to his conception, not indeed in plain language, but (after the way of writers of imagination) in plastic terms.¹ Solmi's verdict on Leonardo is as follows (1908, 46): 'But his insatiable desire to understand everything around him, and to fathom in a spirit of cold superiority the deepest secret of all that is perfect, had condemned Leonardo's work to remain for ever unfinished.'

In an essay in the *Conferenze Fiorentine* the following pronouncement of Leonardo's is quoted, which represents his confession of faith and provides the key to his nature: 'Nessuna cosa si può amare nè odiare, se prima non si ha cognition di quella.'² That is to say: One has no right to love or hate anything if one has not acquired a thorough knowledge of its nature. And the same is repeated by Leonardo in a passage in the treatise on painting where he seems to be defending himself against the charge of irreligion: 'But such carping critics would do better to keep silent. For that (line of conduct) is the way to become acquainted with the Creator of so many wonderful things, and this is the way to love so great an Inventor. For in truth great love springs from great knowledge of the beloved object, and if you know it but little you will be able to love it only a little or not at all . . .'³

¹ Merezhkovsky (1902; German trans., 1903). *Leonardo da Vinci* forms the second work of a great historical trilogy entitled *Christ and Antichrist*. The two other volumes are *Julian the Apostate* and *Peter and Alexis*.

² Bottazzi (1910, 193).

³ *Trattato della Pittura*.

The value of these remarks of Leonardo's is not to be looked for in their conveying an important psychological fact; for what they assert is obviously false, and Leonardo must have known thus as well as we do. It is not true that human beings delay loving or hating until they have studied and become familiar with the nature of the object to which these affects apply. On the contrary they love impulsively, from emotional motives which have nothing to do with knowledge, and whose operation is at most weakened by reflection and consideration. Leonardo, then, could only have meant that the love practised by human beings was not of the proper and unobjectionable kind: one *should* love in such a way as to hold back the affect, subject it to the process of reflection and only let it take its course when it has stood up to the test of thought. And at the same time we understand that he wishes to tell us that it happens so in his case and that it would be worth while for everyone else to treat love and hatred as he does.

And in his case it really seems to have been so. His affects were controlled and subjected to the instinct for research; he did not love and hate, but asked himself about the origin and significance of what he was to love or hate. Thus he was bound at first to appear indifferent to good and evil, beauty and ugliness. During this work of investigation love and hate threw off their positive or negative signs and were both alike transformed into intellectual interest. In reality Leonardo was not devoid of passion; he did not lack the divine spark which is directly or indirectly the driving force - *il primo motore* - behind all human activity. He had merely converted his passion into a thirst for knowledge; he then applied himself to investigation with the persistence, constancy and penetration which is derived from passion, and at the climax of intellectual labour, when knowledge had been won, he allowed the long restrained affect to break loose and to flow away freely, as a stream of water drawn from a river is allowed to flow away when its work is done. When, at the climax of a discovery, he could survey a large portion of the whole nexus, he was overcome by emotion, and in ecstatic language praised the splendour of the part of creation that he had studied, or - in religious phraseology - the greatness of his Creator. This process of transformation in Leonardo has been rightly understood by Solmi. After quoting a passage of this sort in which Leonardo celebrates the sublime law of nature ('O mirabile necessità . . .'), he writes (1910, 11) 'Tale trasfigurazione della scienza della natura in emozione, quasi direi, religiosa, è uno dei tratti caratteristici de' manoscritti vinciani, e si trova cento e cento volte espressa . . .'¹

¹ ['Such a transfiguration of natural science into a sort of religious emotion is one of the characteristic features of Leonardo's manuscripts, and there are hundreds and hundreds of examples of it.']

Because of his insatiable and indefatigable thirst for knowledge Leonardo has been called the Italian Faust. But quite apart from doubts about a possible transformation of the instinct to investigate back into an enjoyment of life - a transformation which we must take as fundamental in the tragedy of Faust - the view may be hazarded that Leonardo's development approaches Spinoza's mode of thinking.

A conversion of psychical instinctual force into various forms of activity can perhaps no more be achieved without loss than a conversion of physical forces. The example of Leonardo teaches us how many other things we have to take into account in connection with these processes. The postponement of loving until full knowledge is acquired ends in a substitution of the latter for the former. A man who has won his way to a state of knowledge cannot properly be said to love and hate; he remains beyond love and hatred. He has investigated instead of loving. And that is perhaps why Leonardo's life was so much poorer in love than that of other great men, and of other artists. The stormy passions of a nature that inspires and consumes, passions in which other men have enjoyed their richest experience, appear not to have touched him.

There are some further consequences. Investigating has taken the place of acting and creating as well. A man who has begun to have an inkling of the grandeur of the universe with all its complexities and its laws readily forgets his own insignificant self. Lost in admiration and filled with true humility, he all too easily forgets that he himself is a part of those active forces and that in accordance with the scale of his personal strength the way is open for him to try to alter a small portion of the destined course of the world - a world in which the small is still no less wonderful and significant than the great.

Leonardo's researches had perhaps first begun, as Solmi believes, in the service of his art;¹ he directed his efforts to the properties and laws of light, colours, shadows and perspective in order to ensure mastery in the imitation of nature and to point the same way to others. It is probable that at that time he already overrated the value to the artist of these branches of knowledge. Still constantly following the lead given by the requirements of his painting he was then driven to investigate the painter's subjects, animals and plants, and the proportions of the human body, and, passing from their exterior, to proceed to gain a knowledge of their internal structure and their vital functions, which indeed also find expression in their appearance and have a claim to be depicted in art. And finally the instinct, which had become overwhelming, swept him away until the connection with the demands of his art was severed, so that he discovered the general laws of mechanics and divined the history of the stratification and fossilization in the Arno valley, and until he could enter in large letters in his book the discovery: *Il sole non si move*.² His investigations extended to practically every branch of natural science, and in every single one he was a discoverer or at least a prophet and pioneer.³ Yet his urge for knowledge was always directed to the external world; something kept him far away from the investigation of the human mind. In the 'Accademia Vinciana', for which he drew some cleverly intertwined emblems, there was little room for psychology.

¹ Solmi (1910, 8): 'Leonardo aveva posto, come regola al pittore, lo studio della natura . . . poi la passione dello studio era divenuta dominante, egli aveva voluto acquistare non più la scienza per l'arte, ma la scienza per la scienza.' ['Leonardo had prescribed the study of nature as a rule for the painter . . . , then the passion for study had become dominant, he had no longer wished to acquire learning for the sake of art, but learning for the sake of learning.']

² ['The sun does not move.']

³ See the enumeration of his scientific achievements in the fine biographical introduction by Marie Herzfeld (1906), in the various essays of the *Conferenze Fiorentine* (1910), and elsewhere.

Then, when he made the attempt to return from investigation to his starting point, the exercise of his art, he found himself disturbed by the new direction of his interests and the changed nature of his mental activity. What interested him in a picture was above all a problem; and behind the first one he saw countless other problems arising, just as he used to in his endless and inexhaustible investigation of nature. He was no longer able to limit his demands, to see the work of art in isolation and to tear it from the wide context to which he knew it belonged. After the most exhausting efforts to bring to expression in it everything which was connected with it in his thoughts, he was forced to abandon it in an unfinished state or to declare that it was incomplete.

The artist had once taken the investigator into his service to assist him; now the servant had become the stronger and suppressed his master.

When we find that in the picture presented by a person's character a single instinct has developed an excessive strength, as did the craving for knowledge in Leonardo, we look for the explanation in a special disposition - though about its determinants (which are probably organic) scarcely anything is yet known. Our psycho-analytic studies of neurotic people have however led us to form two further expectations which it would be gratifying to find confirmed in each particular case. We consider it probable that an instinct like this of excessive strength was already active in the subject's earliest childhood, and that its supremacy was established by impressions in the child's life. We make the further assumption that it found reinforcement from what were originally sexual instinctual forces, so that later it could take the place of a part of the subject's sexual life. Thus a person of this sort would, for example, pursue research with the same passionate devotion that another would give to his love, and he would be able to investigate instead of loving. We would venture to infer that it is not only in the example of the instinct to investigate that there has been a sexual reinforcement, but also in most other cases where an instinct is of special intensity.

Observation of men's daily lives shows us that most people succeed in directing very considerable portions of their sexual instinctual forces to their professional activity. The sexual instinct is particularly well fitted to make contributions of this kind since it is endowed with a capacity for sublimation: that is, it has the power to replace its immediate aim by other aims which may be valued more highly and which are not sexual. We accept this process as proved whenever the history of a person's childhood - that is, the history of his mental development - shows that in childhood this over-powerful instinct was in the service of sexual interests. We find further confirmation if a striking atrophy occurs in the sexual life of maturity, as though a portion of sexual activity had now been replaced by the activity of the over-powerful instinct.

There seem to be special difficulties in applying these expectations to the case of an over-powerful instinct for investigation, since precisely in the case of children there is a reluctance to credit them with either this serious instinct or any noteworthy sexual interests. However, these difficulties are easily overcome. The curiosity of small children is manifested in their untiring love of asking questions; this is bewildering to the adult so long as he fails to understand that all these questions are merely circumlocutions and that they cannot come to an end because the child is only trying to make them take the place of a question which he does *not* ask. When he grows bigger and becomes better informed this expression of curiosity often comes to a sudden end. Psycho-analytic investigation provides us with a full explanation by teaching us that many, perhaps most children, or at least the most gifted ones, pass through a period, beginning when they are about three, which may be called the period of *infantile sexual researches*. So far as we know, the curiosity of children of this age does not awaken spontaneously, but is aroused by the impression made by some important event - by the actual birth of a little brother or sister, or by a fear of it based on external experiences - in which the child perceives a threat to his selfish interests. Researches are directed to the question of where babies come from, exactly as if the child were looking for ways and means to avert so undesired an event. In this way we have been astonished to learn that children refuse to believe the bits of information that are given them - for example that they energetically reject the fable of the stork with its wealth of mythological meaning -, that they date their intellectual independence from this act of disbelief, and that they often feel in serious opposition to adults and in fact never afterwards forgive them for having deceived them here about the true facts of the case. They investigate along their own lines, divine the baby's presence inside its mother's body, and following the lead of the impulses of their own sexuality form theories of babies originating from eating, of their being born through the bowels, and of the obscure part played by the father. By that time they already have a notion of the sexual act, which appears to them to be something hostile and violent. But since their own sexual constitution has not yet reached the point of being able to produce babies, their investigation of where babies come from must inevitably come to nothing too and be abandoned as insoluble. The impression caused by this failure in the first attempt at intellectual independence appears to be of a lasting and deeply depressing kind.¹

¹ These improbable-sounding assertions can be confirmed from a study of my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909b) and of similar observations. In a paper on 'The Sexual Theories of Children' (1908c) I wrote: 'This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution of problems, and the first failure has a crippling effect on the child's whole future.'

When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

In virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component instinct of sexual desire to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful instinct for research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious) the quality of neurosis is absent; there is no attachment to the original complexes of infantile sexual research, and the instinct can operate freely in the service of intellectual interest. Sexual repression, which has made the instinct so strong through the addition to it of sublimated libido, is still taken into account by the instinct, in that it avoids any concern with sexual themes.

If we reflect on the concurrence in Leonardo of his over-powerful instinct for research and the atrophy of his sexual life (which was restricted to what is called ideal homosexuality) we shall be disposed to claim him as a model instance of our third type. The core of his nature, and the secret of it, would appear to be that after his curiosity had been activated in infancy in the service of sexual interests he succeeded in sublimating the greater part of his libido into an urge for research. But it is not easy, to be sure, to prove that this view is right. To do so we should need some picture of his mental development in the first years of his childhood, and it seems foolish to hope for material of that sort when the accounts of his life are so meagre and so unreliable, and when moreover it is a question of information about circumstances that escape the attention of observers even in relation to people of our own generation.

About Leonardo's youth we know very little. He was born in 1452 in the little town of Vinci between Florence and Empoli; he was an illegitimate child, which in those days was certainly not considered a grave social stigma; his father was Ser Piero da Vinci, a notary and descended from a family of notaries and farmers who took their name from the locality of Vinci; his mother was a certain Caterina, probably a peasant girl, who later married another native of Vinci. This mother does not occur again in the history of Leonardo's life, and it is only Merezhkovsky - the novelist - who believes that he has succeeded in finding some trace of her. The only definite piece of information about Leonardo's childhood comes in an official document of the year 1457; it is a Florentine land-register for the purpose of taxation, which mentions Leonardo among the members of the household of the Vinci family as the five-year old illegitimate child of Ser Piero.¹ The marriage of Ser Piero with a certain Donna Albiera remained childless, and it was therefore possible for the young Leonardo to be brought up in his father's house. He did not leave this house till - at what age is not known - he entered Andrea del Verrocchio's studio as an apprentice. In the year 1472 Leonardo's name was already to be found in the list of members of the '*Compagnia dei Pittori*'. That is all.

¹ Scognamiglio (1900, 15).

II

There is, so far as I know, only one place in his scientific note books where Leonardo inserts a piece of information about his childhood. In a passage about the flight of vultures he suddenly interrupts himself to pursue a memory from very early years which had sprung to his mind:

'It seems that I was always destined to be so deeply concerned with vultures; for I recall as one of my very earliest memories that while I was in my cradle a vulture came down to me, and opened my mouth with its tail, and struck me many times with its tail against my lips.'¹

What we have here then is a childhood memory; and certainly one of the strangest sort. It is strange on account of its content and on account of the age to which it is assigned. That a person should be able to retain a memory of his suckling period is perhaps not impossible, but it cannot by any means be regarded as certain. What, however, this memory of Leonardo's asserts - namely that a vulture opened the child's mouth with its tail - sounds so improbable, so fabulous, that another view of it, which at a single stroke puts an end to both difficulties, has more to commend it to our judgement. On this view the scene with the vulture would not be a memory of Leonardo's but a phantasy, which he formed at a later date and transposed to his childhood.²

¹ 'Questo scriver si distintamente del nibio par che sia mio destino, perchè nella mia prima recordatione della mia infanzia e' mi pareva che, essendo io in culla, che un nibio venissi a me e mi aprissi la bocca colla sua coda e molte volte mi percuotesse con tal coda dentro alle labbra.' (Codex Atlanticus, F. 65 v., as given by Scognamiglio.

² [Footnote added 1919:] In a friendly notice of this book Havelock Ellis (1910) has challenged the view put forward above. He objects that this memory of Leonardo's may very well have had a basis of reality: since children's memories often reach very much further back than is commonly supposed; the large bird in question need not of course have been a vulture. This is a point that I will gladly concede, and as a step towards lessening the difficulty I in turn will offer a suggestion - namely that his mother observed the large bird's visit to her child - an event which may easily have had the significance of an omen in her eyes - and repeatedly told him about it afterwards. As a result, I suggest, he retained the memory of his mother's story, and later, as so often happens, it became possible for him to take it for a memory of an experience of his own. However, this alteration does no damage to the force of my general account. It happens, indeed, as a general rule that the phantasies about their childhood which people construct at a late date are attached to trivial but real events of this early, and normally forgotten, period. There must thus have been some secret reason for bringing into prominence a real event of no importance and for elaborating it in the sort of way Leonardo did in his story of the bird, which he dubbed a vulture, and of its remarkable behaviour.

This is often the way in which childhood memories originate. Quite unlike conscious memories from the time of maturity, they are not fixed at the moment of being experienced and afterwards repeated, but are only elicited at a later age when childhood is already past; in the process they are altered and falsified, and are put into the service of later trends, so that generally speaking they cannot be sharply distinguished from phantasies. Their nature is perhaps best illustrated by a comparison with the way in which the writing of history originated among the peoples of antiquity. As long as a nation was small and weak it gave no thought to the writing of its history. Men tilled the soil of their land, fought for their existence against their neighbours, and tried to gain territory from them and to acquire wealth. It was an age of heroes, not of historians. Then came another age, an age of reflection: men felt themselves to be rich and powerful, and now felt a need to learn where they had come from and how they had developed. Historical writing, which had begun to keep a continuous record of the present, now also cast a glance back to the past, gathered traditions and legends, interpreted the traces of antiquity that survived in customs and usages, and in this way created a history of the past. It was inevitable that this early history should have been an expression of present beliefs and wishes rather than a true picture of the past; for many things had been dropped from the nation's memory, while others were distorted, and some remains of the past were given a wrong interpretation in order to fit in with contemporary ideas. Moreover people's motive for writing history was not objective curiosity but a desire to influence their contemporaries, to encourage and inspire them, or to hold a mirror up before them. A man's conscious memory of the events of his maturity is in every way comparable to the first kind of historical writing; while the memories that he has of his childhood correspond, as far as their origins and reliability are concerned, to the history of a nation's earliest days, which was compiled later and for tendentious reasons.

If, then, Leonardo's story about the vulture that visited him in his cradle is only a phantasy from a later period, one might suppose it could hardly be worth while spending much time on it. One might be satisfied with explaining it on the basis of his inclination, of which he makes no secret, to regard his preoccupation with the flight of birds as pre-ordained by destiny. Yet in underrating this story one would be committing just as great an injustice as if one were carelessly to reject the body of legends, traditions and interpretations found in a nation's early history. In spite of all the distortions and misunderstandings, they still represent the reality of the past: they are what a people forms out of the experience of its early days and under the dominance of motives that were once powerful and still operate to-day; and if it were only possible, by a knowledge of all the forces at work, to undo these distortions, there would be no difficulty in disclosing the historical truth lying behind the legendary material. The same holds good for the childhood memories or phantasies of an individual. What someone thinks he remembers from his childhood is not a matter of indifference; as a rule the residual memories - which he himself does not understand - cloak priceless pieces of evidence about the most important features in his mental development.¹ As we now possess in the techniques of psycho-analysis excellent methods for helping us to bring this concealed material to light, we may venture to fill in the gap in Leonardo's life story by analysing his childhood phantasy. And if in doing so we remain dissatisfied with the degree of certainty which we achieve, we shall have to console ourselves with the reflection that so many other studies of this great and enigmatic man have met with no better fate.

¹ [Footnote added 1919:] Since I wrote the above words I have attempted to make similar use of an unintelligible memory dating from the childhood of another man of genius. In the account of his life that Goethe wrote when he was about sixty (*'Dichtung und Wahrheit'*) there is a description in the first few pages of how, with the encouragement of his neighbours, he slung first some small and then some large pieces of crockery out of the window into the street, so that they were smashed to pieces. This is, indeed, the only scene that he reports from the earliest years of childhood. The sheer inconsequentiality of its content, the way in which it corresponded with the childhood memories of other human beings who did not become particularly great, and the absence in this passage of any mention of the young brother who was born when Goethe was three and three-quarters, and who died when he was nearly ten - all this induced me to undertake an analysis of this childhood memory. (This child is in fact mentioned at a later point in the book, where Goethe dwells on the many illnesses of childhood.) I hoped to be able as a result to replace it by something which would be more in keeping with the context of Goethe's account and whose content would make it worthy of preservation and of the place he has given it in the history of his life. The short analysis made it possible for the throwing-out of the crockery to be recognized as a magical act directed against a troublesome intruder; and at the place in the book where he describes the episode the intention is to triumph over the fact that a second son was not in the long run permitted to disturb Goethe's close relation with his mother. If the earliest memory of childhood, preserved in disguises such as these, should be concerned - in Goethe's case as well as in Leonardo's - with the mother, what would be so surprising in that?

If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, '*coda*', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of *fellatio*, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

I hope the reader will restrain himself and not allow a surge of indignation to prevent his following psycho-analysis any further because it leads to an unpardonable aspersion on the memory of a great and pure man the very first time it is applied to his case. Such indignation, it is clear, will never be able to tell us the significance of Leonardo's childhood phantasy; at the same time Leonardo has acknowledged the phantasy in the most unambiguous fashion, and we cannot abandon our expectation - or, if it sounds better, our prejudice - that a phantasy of this kind must have *some* meaning, in the same way as any other psychical creation: a dream, a vision or a delirium. Let us rather therefore give a fair hearing for a while to the work of analysis, which indeed has not yet spoken its last word.

The inclination to take a man's sexual organ into the mouth and suck at it, which in respectable society is considered a loathsome sexual perversion, is nevertheless found with great frequency among women of to-day - and of earlier times as well, as ancient sculptures show -, and in the state of being in love it appears completely to lose its repulsive character. Phantasies derived from this inclination are found by doctors even in women who have not become aware of the possibilities of obtaining sexual satisfaction in this way by reading Krafft Ebing's *Psychopathia Sexualis* or from other sources of information. Women, it seems, find no difficulty in producing this kind of wishful phantasy spontaneously.¹ Further investigation in forms us that this situation, which morality condemns with such severity, may be traced to an origin of the most innocent kind. It only repeats in a different form a situation in which we all once felt comfortable - when we were still in our suckling days ('*essendo io in culla*')² and took our mother's (or wet-nurse's) nipple into our mouth and sucked at it. The organic impression of this experience - the first source of pleasure in our life - doubtless remains indelibly printed on us; and when at a later date the child becomes familiar with the cow's udder whose function is that of a nipple, but whose shape and position under the belly make it resemble a penis, the preliminary stage has been reached which will later enable him to form the repellent sexual phantasy.

¹ On this point compare my 'Fragment of an Analysis of a Case of Hysteria' (1905e).

² ['While I was in my cradle.']

Now we understand why Leonardo assigned the memory of his supposed experience with the vulture to his suckling period. What the phantasy conceals is merely a reminiscence of sucking - or being suckled - at his mother's breast, a scene of human beauty that he, like so many artists, undertook to depict with his brush, in the guise of the mother of God and her child. There is indeed another point which we do not yet understand and which we must not lose sight of: this reminiscence, which has the same importance for both sexes, has been transformed by the man Leonardo into a passive homosexual phantasy. For the time being we shall put aside the question of what there may be to connect homosexuality with sucking at the mother's breast, merely recalling that tradition does in fact represent Leonardo as a man with homosexual feelings. In this connection, it is irrelevant to our purpose whether the charge brought against the young Leonardo was justified or not. What decides whether we describe someone as an invert is not his actual behaviour, but his emotional attitude.

Our interest is next claimed by another unintelligible feature of Leonardo's childhood phantasy. We interpret the phantasy as one of being suckled by his mother, and we find his mother replaced by - a vulture. Where does this vulture come from and how does it happen to be found in its present place?

At this point a thought comes to the mind from such a remote quarter that it would be tempting to set it aside. In the hieroglyphics of the ancient Egyptians the mother is represented by a picture of a vulture.¹ The Egyptians also worshipped a Mother Goddess, who was represented as having a vulture's head, or else several heads, of which at least one was a vulture's.² This goddess's name was pronounced *Mut*. Can the similarity to the sound of our word *Mutter* ['mother'] be merely a coincidence? There is, then, some real connection between vulture and mother - but what help is that to us? For have we any right to expect Leonardo to know of it, seeing that the first man who succeeded in reading hieroglyphics was François Champollion (1790-1832)?³

It would be interesting to enquire how it could be that the ancient Egyptians came to choose the vulture as a symbol of motherhood. Now the religion and civilization of the Egyptians were objects of scientific curiosity even to the Greeks and the Romans: and long before we ourselves were able to read the monuments of Egypt we had at our disposal certain pieces of information about them derived from the extant writings of classical antiquity. Some of these writings were by well-known authors, such as Strabo, Plutarch and Ammianus Marcellinus; while others bear unfamiliar names and are uncertain in their source of origin and their date of composition, like the *Hieroglyphica* of Horapollon Nilous and the book of oriental priestly wisdom which has come down to us under the name of the god Hermes Trismegistos. We learn from these sources that the vulture was regarded as a symbol of motherhood because only female vultures were believed to exist; there were, it was thought, no males of this species.⁴ A counterpart to this restriction to one sex was also known to the natural history of antiquity: in the case of the scarabaeus beetle, which the Egyptians worshipped as divine, it was thought that only males existed.⁵

¹ Horapollon (*Hieroglyphica* 1, 11): 'Μητέρα δε γράφοντες . . . γυπαζωγαφοῦσιν.' ['To denote a mother . . . they delineate a vulture.']

² Roscher (1894-97), Lanzone (1882).

³ Hartleben (1906).

⁴ 'γυπα δε ἀρρενα σὺ Φασι γινέσθαι ποτε ἀλλὰ θηλείας ἀπάσας.' ['They say that no male vulture has ever existed but all are females.'] Quoted by von Römer (1903, 732).

⁵ Plutarch: 'Veluti scarabaeos mares tantum esse putarunt Aegyptii sic inter vultures mares non inveniri statuerunt.' ['Just as they believed that only male scarabs existed, so the Egyptians concluded that no male vultures were to be found.']

How then were vultures supposed to be impregnated if all of them were female? This is a point fully explained in a passage in Horapollo.¹ At a certain time these birds pause in mid-flight, open their vagina and are impregnated by the wind.

We have now unexpectedly reached a position where we can take something as very probable which only a short time before we had to reject as absurd. It is quite possible that Leonardo was familiar with the scientific fable which was responsible for the vulture being used by the Egyptians as a pictorial representation of the idea of mother. He was a wide reader and his interest embraced all branches of literature and learning. In the Codex Atlanticus we find a catalogue of all the books he possessed at a particular date,² and in addition numerous jottings on other books that he had borrowed from friends; and if we may judge by the extracts from his notes by Richter,³ the extent of his reading can hardly be overestimated. Early works on natural history were well represented among them in addition to contemporary books; and all of them were already in print at the time. Milan was in fact the leading city in Italy for the new art of printing.

On proceeding further we come across a piece of information which can turn the probability that Leonardo knew the fable of the vulture into a certainty. The learned editor and commentator on Horapollo has the following note on the text already quoted above: 'Caeterum hanc fabulam de vulturibus cupide amplexi sunt Patres Ecclesiastici, ut ita argumento ex rerum natura petito refutarent eos, qui Virginis partum negabant; itaque apud omnes fere hujus rei mentio occurrit.'⁴

¹ *Horapollonis Niloi Hieroglyphica*, ed. Leemans (1835, 14). The words that refer to the vulture's sex run: 'πητέγα μέν, ἐπειδὴ ἀγγεῦ ἐν τοῦτῳ τῷ γένει τῶν ζώων σύχ' ὑπάγχει.' ['(They use the picture of a vulture to denote) a mother, because in this race of creatures there are no males.']

² Müntz (1899, 282).

³ Müntz, (ibid.).

⁴ ['But this story about the vulture was eagerly taken up by the Fathers of the Church, in order to refute, by means of a proof drawn from the natural order, those who denied the Virgin Birth. The subject is therefore mentioned in almost all of them.']

So the fable of the single sex of vultures and their mode of conception remained something very far from an unimportant anecdote like the analogous tale of the scarabaeus beetle; it had been seized on by the Fathers of the Church so that they could have at their disposal a proof drawn from natural history to confront those who doubted sacred history. If vultures were described in the best accounts of antiquity as depending on the wind for impregnation, why could not the same thing have also happened on one occasion with a human female? Since the fable of the vulture could be turned to this account 'almost all' the Fathers of the Church made a practice of telling it, and thus it can hardly be doubted that Leonardo too came to know of it through its being favoured by so wide a patronage.

We can now reconstruct the origin of Leonardo's vulture phantasy. He once happened to read in one of the Fathers or in a book on natural history the statement that all vultures were females and could reproduce their kind without any assistance from a male: and at that point a memory sprang to his mind, which was transformed into the phantasy we have been discussing, but which meant to signify that he also had been such a vulture-child - he had had a mother, but no father. With this memory was associated, in the only way in which impressions of so great an age can find expression, an echo of the pleasure he had had at his mother's breast. The allusion made by the Fathers of the Church to the idea of the Blessed Virgin and her child - an idea cherished by every artist - must have played its part in helping the phantasy to appear valuable and important to him. Indeed in this way he was able to identify himself with the child Christ, the comforter and saviour not of this one woman alone.

Our aim in dissecting a childhood phantasy is to separate the real memory that it contains from the later motives that modify and distort it. In Leonardo's case we believe that we now know the real content of the phantasy: the replacement of his mother by the vulture indicates that the child was aware of his father's absence and found himself alone with his mother. The fact of Leonardo's illegitimate birth is in harmony with his vulture phantasy; it was only on this account that he could compare himself to a vulture-child. But the next reliable fact that we possess about his youth is that by the time he was five he had been received into his father's household. We are completely ignorant when that happened - whether it was a few months after his birth or whether it was a few weeks before the drawing-up of the land-register. It is here that the interpretation of the vulture phantasy comes in: Leonardo, it seems to tell us, spent the critical first years of his life not by the side of his father and stepmother, but with his poor, forsaken, real mother, so that he had time to feel the absence of his father. This seems a slender and yet a somewhat daring conclusion to have emerged from our psycho-analytic efforts, but its significance will increase as we continue our investigation. Its certainty is reinforced when we consider the circumstances that did in fact operate in Leonardo's childhood. In the same year that Leonardo was born, the sources tell us, his father, Ser Piero da Vinci, married Donna Albiera, a lady of good birth; it was to the childlessness of this marriage that the boy owed his reception into his father's (or rather his grandfather's) house - an event which had taken place by the time he was five years old, as the document attests. Now it is not usual at the start of a marriage to put an illegitimate offspring into the care of the young bride who still expects to be blessed with children of her own. Years of disappointment must surely first have elapsed before it was decided to adopt the illegitimate child - who had probably grown up an attractive young boy - as a compensation for the absence of the legitimate children that had been hoped for. It fits in best with the interpretation of the vulture phantasy if at least three years of Leonardo's life, and perhaps five, had elapsed before he could exchange the solitary person of his mother for a parental couple. And by then it was too late. In the first three or four years of life certain impressions become fixed and ways of reacting to the outside world are established which can never be deprived of their importance by later experiences.

If it is true that the unintelligible memories of a person's childhood and the phantasies that are built on them invariably emphasize the most important elements in his mental development, then it follows that the fact which the vulture phantasy confirms, namely that Leonardo spent the first years of his life alone with his mother, will have been of decisive influence in the formation of his inner life. An inevitable effect of this state of affairs was that the child - who was confronted in his early life with one problem more than other children - began to brood on this riddle with special intensity, and so at a tender age became a researcher, tormented as he was by the great question of where babies come from and what the father has to do with their origin. It was a vague suspicion that his researches and the history of his childhood were connected in this way which later prompted him to exclaim that he had been destined from the first to investigate the problem of the flight of birds since he had been visited by a vulture as he lay in his cradle. Later on it will not be difficult to show how his curiosity about the flight of birds was derived from the sexual researches of his childhood.

III

In Leonardo's childhood phantasy we have taken the element of the vulture to represent the real content of his memory, while the context in which Leonardo himself placed his phantasy has thrown a bright light on the importance which that content had for his later life. In proceeding with our work of interpretation we now come up against the strange problem of why this content has been recast into a homosexual situation. The mother who suckles her child - or to put it better, at whose breast the child sucks - has been turned into a vulture that puts its tail into the child's mouth. We have asserted that, according to the usual way in which language makes use of substitutes, the vulture's '*coda*' cannot possibly signify anything other than a male genital, a penis. But we do not understand how imaginative activity can have succeeded in endowing precisely this bird which is a mother with the distinguishing mark of masculinity; and in view of this absurdity we are at a loss how to reduce this creation of Leonardo's phantasy to any rational meaning.

However, we should not despair, as we reflect on the number of apparently absurd dreams that we have in the past compelled to give up their meaning. Is there any reason why a memory of childhood should offer us more difficulty than a dream?

Remembering that it is unsatisfactory when a peculiar feature is found singly, let us hasten to add another to it which is even more striking.

The vulture-headed Egyptian goddess Mut, a figure without any personal character according to Drexler's article in Roscher's lexicon, was often merged with other mother goddesses of a more strongly marked individuality, like Isis and Hathor, but at the same time she maintained her separate existence and cult. A special feature of the Egyptian pantheon was that the individual gods did not disappear in the process of syncretization. Alongside the fusion of gods the individual divinities continued to exist in independence. Now this vulture-headed mother goddess was usually represented by the Egyptians with a phallus;¹ her body was female, as the breasts indicated, but it also had a male organ in a state of erection.

¹ See the illustrations in Lanzone (1882, Plates CXXXVI - CXXXVIII).

In the goddess Mut, then, we find the same combination of maternal and masculine characteristics as in Leonardo's phantasy of the vulture. Are we to explain this coincidence by assuming that from studying his books Leonardo had also learnt of the androgynous nature of the maternal vulture? Such a possibility is more than questionable; it appears that the sources to which he had access contained no information about this remarkable feature. It is more plausible to trace the correspondence back to a common factor operative in both cases but still unknown.

Mythology can teach us that an androgynous structure, a combination of male and female sex characters, was an attribute not only of Mut but also of other deities like Isis and Hathor - though perhaps of these only in so far as they too had a maternal nature and became amalgamated with Mut (Römer, 1903). It teaches us further that other Egyptian deities, like Neith of Sais - from whom the Greek Athene was later derived - were originally conceived of as androgynous, i.e. as hermaphrodite, and that the same was true of many of the *Greek* gods, especially of those associated with Dionysus, but also of Aphrodite, who was later restricted to the role of a female goddess of love. Mythology may then offer the explanation that the addition of a phallus to the female body is intended to denote the primal creative force of nature, and that all these hermaphrodite divinities are expressions of the idea that only a combination of male and female elements can give a worthy representation of divine perfection. But none of these considerations gives us an explanation of the puzzling psychological fact that the human imagination does not boggle at endowing a figure which is intended to embody the essence of the mother with the mark of male potency which is the opposite of everything maternal.

Infantile sexual theories provide the explanation. There was once a time when the male genital was found compatible with the picture of the mother. When a male child first turns his curiosity to the riddles of sexual life, he is dominated by his interest in his own genital. He finds that part of his body too valuable and too important for him to be able to believe that it could be missing in other people whom he feels he resembles so much. As he cannot guess that there exists another type of genital structure of equal worth, he is forced to make the assumption that all human beings, women as well as men, possess a penis like his own. This preconception is so firmly planted in the youthful investigator that it is not destroyed even when he first observes the genitals of little girls. His perception tells him, it is true, that there is something different from what there is in him, but he is incapable of admitting to himself that the content of this perception is that he cannot find a penis in girls. That the penis could be missing strikes him as an uncanny and intolerable idea, and so in an attempt at a compromise he comes to the conclusion that little girls have a penis as well, only it is still very small; it will grow later.¹ If it seems from later observations that this expectation is not realized, he has another remedy at his disposal: little girls too had a penis, but it was cut off and in its place was left a wound. This theoretical advance already makes use of personal experiences of a distressing kind: the boy in the meantime has heard the threat that the organ which is so dear to him will be taken away from him if he shows his interest in it too plainly. Under the influence of this threat of castration he now sees the notion he has gained of the female genitals in a new light; henceforth he will tremble for his masculinity, but at the same time he will despise the unhappy creatures on whom the cruel punishment has, as he supposes, already fallen.²

¹ Compare the observations in the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [added 1919:], in the *Internationale Zeitschrift für ärztliche Psychoanalyse* and in *Imago*.

² [Footnote added 1919:] The conclusion strikes me as inescapable that here we may also trace one of the roots of the anti-semitism which appears with such elemental force and finds such irrational expression among the nations of the West. Circumcision is unconsciously equated with castration. If we venture to carry our conjectures back to the primaeval days of the human race we can surmise that originally circumcision must have been a milder substitute, designed to take the place of castration.

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, '*coupeurs de nattes*'¹ play the part of people who carry out an act of castration on the female genital organ.

People will not reach a proper understanding of the activities of children's sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the '*pudenda*', objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that it is only with reluctance that the majority of those alive to-day obey the command to propagate their kind; they feel that their dignity as human beings suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the *primaeval* days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learned human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital-worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind to-day contain survivals from every phase of this process of development.²

¹ [Perverts who enjoy cutting off females' hair.]

² Cf. Knight.

Impressive analogies from biology have prepared us to find that the individual's mental development repeats the course of human development in an abbreviated form; and the conclusions which psycho-analytic research into the child's mind has reached concerning the high value set on the genitals in infancy will not therefore strike us as improbable. The child's assumption that his mother has a penis is thus the common source from which are derived the androgynously-formed mother goddesses such as the Egyptian Mut and the vultures' '*coda*' in Leonardo's childhood phantasy. It is in fact only due to a misunderstanding that we describe these representations of gods as hermaphrodite in the medical sense of the word. In none of them is there a combination of the true genitals of both sexes - a combination which, to the abhorrence of all beholders, is found in some cases of malformation; all that has happened is that the male organ has been added to the breasts which are the mark of a mother, just as it was present in the child's first idea of his mother's body. This form of the mother's body, the revered creation of *primaeval* phantasy, has been preserved for the faithful by mythology. We can now provide the following translation of the emphasis given to the vulture's tail in Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's early sexual researches, which in our opinion had a decisive effect on the whole of his later life.

At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal, homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psycho-analytic study of homosexual patients that such a connection does exist and is in fact an intimate and necessary one.

Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²

¹ I refer in particular to the investigations of I. Sadger, which I can in the main confirm from my own experience. I am also aware that Wilhelm Stekel of Vienna and Sándor Ferenczi of Budapest have arrived at the same results.

² [Footnote added 1919:] Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

After this preliminary stage a transformation sets in whose mechanism is known to us but whose motive forces we do not yet understand. The child's love for his mother cannot continue to develop consciously any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood - boys whom he loves in the way in which his mother loved *him* when he was a child. He finds the objects of his love along the path of *narcissism*, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name.

Psychological considerations of a deeper kind justify the assertion that a man who has become a homosexual in this way remains unconsciously fixated to the mnemonic image of his mother. By repressing his love for his mother he preserves it in his unconscious and from now on remains faithful to her. While he seems to pursue boys and to be their lover, he is in reality running away from the other women, who might cause him to be unfaithful. In individual cases direct observation has also enabled us to show that the man who gives the appearance of being susceptible only to the charms of men is in fact attracted by women in the same way as a normal man; but on each occasion he hastens to transfer the excitation he has received from women on to a male object, and in this manner he repeats over and over again the mechanism by which he acquired his homosexuality.

We are far from wishing to exaggerate the importance of these explanations of the psychical genesis of homosexuality. It is quite obvious that they are in sharp contrast to the official theories of those who speak for homosexuals, but we know that they are not sufficiently comprehensive to make a conclusive explanation of the problem possible. What is for practical reasons called homosexuality may arise from a whole variety of psychosexual inhibitory processes; the particular process we have singled out is perhaps only one among many, and is perhaps related to only one type of 'homosexuality'. We must also admit that the number of cases of our homosexual type in which it is possible to point to the determinants which we require far exceeds the number of those where the deduced effect actually, takes place; We should not have had any cause at all for entering into the psychical genesis of the form of homosexuality we have studied if there were not a strong presumption that Leonardo, whose phantasy of the vulture was our starting point, was himself a homosexual of this very type.

Few details are known about the sexual behaviour of the great artist and scientist, but we may place confidence in the probability that the assertions of his contemporaries were not grossly erroneous. In the light of these traditions, then, he appears as a man whose sexual need and activity were exceptionally reduced, as if a higher aspiration had raised him above the common animal need of mankind. It may remain open to doubt whether he ever sought direct sexual satisfaction - and if so, in what manner - or whether he was able to dispense with it altogether. We are however justified in looking in him too for the emotional currents which drive other men imperatively on to perform the sexual act; for we cannot imagine the mental life of any human being in the formation of which sexual desire in the broadest sense - libido - did not have its share, even if that desire has departed far from its original aim, or has refrained from putting itself into effect.

We cannot expect to find in Leonardo anything more than *traces* of untransformed sexual inclination. But these point in one direction and moreover allow him to be reckoned as a homosexual. It has always been emphasized that he took only strikingly handsome boys and youths as pupils. He treated them with kindness and consideration, looked after them, and when they were ill nursed them himself, just as a mother nurses her children and just as his own mother might have tended him. As he had chosen them for their beauty and not for their talent, none of them - Cesare da Sesto, Boltraffio, Andrea Salaino, Francesco Melzi and others - became a painter of importance. Generally they were unable to make themselves independent of their master, and after his death they disappeared without having left any definite mark on the history of art. The others, whose works entitled them to be called his pupils, like Luini and Bazi, called Sodoma, he probably did not know personally.

We realize that we shall have to meet the objection that Leonardo's behaviour towards his pupils has nothing at all to do with sexual motives and that it allows no conclusions to be drawn about his particular sexual inclination. Against this we wish to submit with all caution that our view explains some peculiar features of the artist's behaviour which would otherwise have to remain a mystery. Leonardo kept a diary; he made entries in his small hand (written from right to left) which were meant only for himself. It is noteworthy that in this diary he addressed himself in the second person. 'Learn the multiplication of roots from Master Luca.' (Solmi, 1908, 152). 'Get Master d'Abacco to show you how to square the circle.' (Loc. cit.) Or on the occasion of a journey: 'I am going to Milan on business to do with my garden . . . Have two baggage trunks made. Get Boltraffio to show you the turning-lathe and get him to polish a stone on it. Leave the book for Master Andrea il Todesco.' (Ibid., 203.)¹ Or a resolution of very different importance: 'You have to show in your treatise that the earth is a star, like the moon or something like it, and thus prove the nobility of our world.' (Herzfeld, 1906, 141.)

¹ Leonardo is behaving here like someone whose habit it was to make his daily confession to another person and who uses his diary as a substitute for him. For a conjecture as to who this person may have been, see Merezhkovsky (1903, 367).

In this diary, which, by the way, like the diaries of other mortals, often dismisses the most important events of the day in a few words or else passes them over in complete silence, there are some entries which on account of their strangeness are quoted by all Leonardo's biographers. They are notes of small sums of money spent by the artist - notes recorded with a minute exactness, as if they were made by a pedantically strict and parsimonious head of a household. There is on the other hand no record of the expenditure of larger sums or any other evidence that the artist was at home in keeping accounts. One of these notes has to do with a new cloak which he bought for his pupil Andrea Salaino:¹

Silver brocade	15 lire	4 soldi
Crimson velvet for trimming	9 lire	- soldi
Braid	- lire	9 soldi
Buttons	- lire	12 soldi

Another very detailed note brings together all the expenses he incurred through the bad character and thievish habits of another pupil:² 'On the twenty-first day of April, 1490, I began this book and made a new start on the horse.³ Jacomo came to me on St. Mary Magdalen's day, 1490: he is ten years old.' (Marginal note: 'thievish, untruthful, selfish, greedy.') 'On the second day I had two shirts cut out for him, a pair of trousers and a jacket, and when I put the money aside to pay for these things, he stole the money from my purse, and it was never possible to make him own up, although I was absolutely sure of it.' (Marginal note: '4 lire . . .') The report of the child's misdeeds runs on in this way and ends with the reckoning of expenses: 'In the first year, a cloak, 2 lire; 6 shirts, 4 lire; 3 jackets, 6 lire; 4 pairs of stockings, 7 lire; etc.'⁴

¹ The text is that given by Merezhkovsky (1903, 282).

² Or model.

³ For the equestrian statue of Francesco Sforza.

⁴ The full text is to be found in Herzfeld (1906, 45).

Nothing is further from the wishes of Leonardo's biographers than to try to solve the problems in their hero's mental life by starting from his small weaknesses and peculiarities; and the usual comment that they make on these singular accounts is one which lays stress on the artist's kindness and consideration for his pupils. They forget that what calls for explanation is not Leonardo's behaviour, but the fact that he left these pieces of evidence of it behind him. As it is impossible to believe that his motive was that of letting proofs of his good nature fall into our hands, we must assume that it was another motive, an affective one, which led him to write these notes down. What motive it was is not easy to guess, and we should be unable to suggest one if there were not another account found among Leonardo's papers which throws a vivid light on these strangely trifling notes about his pupils' clothing, etc.:

Expenses after Caterina's death for her funeral	27 florins
2 pounds of wax	18 "
For transporting and erecting the cross	12 "
Catafalque	4 "
Pall-bearers	8 "
For 4 priests and 4 clerks	20 "
Bell-ringing	2 "
For the grave-diggers	16 "
For the licence - to the officials	1 "
	<hr/>
Total	108 florins
Previous expenses	
For the doctor	4 florins
For sugar and candles	12 "
	<hr/>
	16 florins
Grand total	<hr/> 124 florins. ¹

¹ Merezhkovsky (1903, 372). - As a melancholy example of the uncertainty that surrounds the information, which is in any case scanty enough, about Leonardo's private life, I may mention the fact that the same account is quoted by Solmi (1908, 104) with considerable variations. The most serious one is that soldi are given instead of florins. It may be assumed that florins in this account do not mean the old 'gold florins' but the monetary units which were used later and were worth 1 2/3 lire or 33 1/3 soldi. Solmi makes Caterina a servant who had looked after Leonardo's household for some time. The source from which the two versions of these accounts were taken was not accessible to me.

The novelist Merezhkovsky alone is able to tell us who this Caterina was. From two other short notes¹ he concludes that Leonardo's mother, the poor peasant woman of Vinci, came to Milan in 1493 to visit her son, who was then 41; that she fell ill there, was taken to hospital by Leonardo, and when she died was honoured by him with this costly funeral.

This interpretation by the psychological novelist cannot be put to the proof, but it can claim so much inner probability, and is so much in harmony with all that we otherwise know of Leonardo's emotional activity, that I cannot refrain from accepting it as correct. He had succeeded in subjecting his feelings to the yoke of research and in inhibiting their free utterance; but even for him there were occasions when what had been suppressed obtained expression forcibly. The death of the mother he had once loved so dearly was one of these. What we have before us in the account of the costs of the funeral is the expression - distorted out of all recognition - of his mourning for his mother. We wonder how such distortion could come about, and indeed we cannot understand it if we treat it as a normal mental process. But similar processes are well known to us in the abnormal conditions of neurosis and especially of what is known as 'obsessional neurosis'. There we can see how the expression of intense feelings, which have however become unconscious through repression, is displaced on to trivial and even foolish actions. The expression of these repressed feelings has been lowered by the forces opposed to them to such a degree that one would have had to form a most insignificant estimate of their intensity; but the imperative compulsiveness with which this trivial expressive act is performed betrays the real force of the impulses - a force which is rooted in the unconscious and which consciousness would like to deny. Only a comparison such as this with what happens in obsessional neurosis can explain Leonardo's account of the expenses of his mother's funeral. In his unconscious he was still tied to her by erotically coloured feelings, as he had been in childhood. The opposition that came from the subsequent repression of this childhood love did not allow him to set up a different and worthier memorial to her in his diary. But what emerged as a compromise from this neurotic conflict had to be carried out; and thus it was that the account was entered in the diary, and has come to the knowledge of posterity as something unintelligible.

¹ 'Caterina arrived on July 16, 1493.' - 'Giovannina - a fabulous face - Call on Caterina in the hospital and make enquiries.'

It does not seem a very extravagant step to apply what we have learnt from the funeral account to the reckonings of the pupils' expenses. They would then be another instance of the scanty remnants of Leonardo's libidinal impulses finding expression in a compulsive manner and in a distorted form. On that view, his mother and his pupils, the likenesses of his own boyish beauty, had been his sexual objects - so far as the sexual repression which dominated his nature allows us so to describe them - and the compulsion to note in laborious detail the sums he spent on them betrayed in this strange way his rudimentary conflicts. From this it would appear that Leonardo's erotic life did really belong to the type of homosexuality whose psychical development we have succeeded in disclosing, and the emergence of the homosexual situation in his phantasy of the vulture would become intelligible to us: for its meaning was exactly what we have already asserted of that type. We should have to translate it thus: 'It was through this erotic relation with my mother that I became a homosexual.'¹

¹ The forms of expression in which Leonardo's repressed libido was allowed to show itself - circumstantiality and concern over money - are among the traits of character which result from anal erotism. See my 'Character and Anal Erotism' (1908*b*).

IV

We have not yet done with Leonardo's vulture phantasy. In words which only too plainly recall a description of a sexual act ('and struck me many times with its tail against my lips'), Leonardo stresses the intensity of the erotic relations between mother and child. From this linking of his mother's (the vulture's) activity with the prominence of the mouth zone it is not difficult to guess that a second memory is contained in the phantasy. This may be translated: 'My mother pressed innumerable passionate kisses on my mouth.' The phantasy is compounded from the memory of being suckled and being kissed by his mother.

Kindly nature has given the artist the ability to express his most secret mental impulses, which are hidden even from himself, by means of the works that he creates; and these works have a powerful effect on others who are strangers to the artist, and who are themselves unaware of the source of their emotion. Can it be that there is nothing in Leonardo's life work to bear witness to what his memory preserved as the strongest impression of his childhood? One would certainly expect there to be something. Yet if one considers the profound transformations through which an impression in an artist's life has to pass before it is allowed to make its contribution to a work of art, one will be bound to keep any claim to certainty in one's demonstration within very modest limits; and this is especially so in Leonardo's case.

Anyone who thinks of Leonardo's paintings will be reminded of a remarkable smile, at once fascinating and puzzling, which he conjured up on the lips of his female subjects. It is an unchanging smile, on long, curved lips; it has become a mark of his style and the name 'Leonardesque' has been chosen for it.¹ In the strangely beautiful face of the Florentine Mona Lisa del Giocondo it has produced the most powerful and confusing effect on whoever looks at it. This smile has called for an interpretation, and it has met with many of the most varied kinds, none of which has been satisfactory. 'Voilà quatre siècles bientôt que Monna Lisa fait perdre la tête à tous ceux qui parlent d'elle, après l'avoir longtemps regardée.'²

¹ [Footnote added 1919:] The connoisseur of art will think here of the peculiar fixed smile found in archaic Greek sculptures - in those, for example, from Aegina; he will perhaps also discover something similar in the figures of Leonardo's teacher Verrocchio and therefore have some misgivings in accepting the arguments that follow.

² ['For almost four centuries now Mona Lisa has caused all who talk of her, after having gazed on her for long, to lose their heads.'] The words are Gruyer's, quoted by von Seidlitz (1909, 2, 280).

Muther (1909, 1, 314) writes: 'What especially casts a spell on the spectator is the daemonic magic of this smile. Hundreds of poets and authors have written about this woman who now appears to smile on us so seductively, and now to stare coldly and without soul into space; and no one has solved the riddle of her smile, no one has read the meaning of her thoughts. Everything, even the landscape, is mysteriously dream-like, and seems to be trembling in a kind of sultry sensuality.'

The idea that two distinct elements are combined in Mona Lisa's smile is one that has struck several critics. They accordingly find in the beautiful Florentine's expression the most perfect representation of the contrasts which dominate the erotic life of women; the contrast between reserve and seduction, and between the most devoted tenderness and a sensuality that is ruthlessly demanding - consuming men as if they were alien beings. This is the view of Müntz (1899, 417): 'On sait quelle énigme indéchiffrable et passionnante Monna Lisa Gioconda ne cesse depuis bientôt quatre siècles de proposer aux admirateurs pressés devant elle. Jamais artiste (j'emprunte la plume du délicat écrivain qui se cache sous le pseudonyme de Pierre de Corlay) "a-t-il traduit ainsi l'essence même de la fémininité: tendresse et coquetterie, pudeur et sourde volupté, tout le mystère d'un coeur qui se réserve, d'un cerveau qui réfléchit, d'une personnalité qui se garde et ne livre d'elle-même que son rayonnement . . ."'¹ The Italian writer Angelo Conti (1910, 93) saw the picture in the Louvre brought to life by a ray of sunshine. 'La donna sorrideva in una calma regale: i suoi istinti di conquista, di ferocia, tutta l'eredità della specie, la volontà della seduzione e dell' agguato, la grazia del inganno, la bontà che cela un proposito crudele, tutto ciò appariva alternativamente e scompariva dietro il velo ridente e si fondeva nel poema del suo sorriso . . . Buona e malvagia, crudele e compassionevole, graziosa e felina, ella rideva . . .'²

¹ ['We know what an insoluble and enthralling enigma Mona Lisa Gioconda has never ceased through nearly four centuries to pose to the admirers that throng in front of her. No artist (I borrow the words from the sensitive writer who conceals himself behind the pseudonym of Pierre de Corlay) "has ever expressed so well the very essence of femininity: tenderness and coquetry, modesty and secret sensuous joy, all the mystery of a heart that holds aloof, a brain that meditates, a personality that holds back and yields nothing of itself save its radiance".']

² ['The lady smiled in regal calm: her instincts of conquest, of ferocity, all the heredity of the species, the will to seduce and to ensnare, the charm of deceit, the kindness that conceals a cruel purpose, - all this appeared and disappeared by turns behind the laughing veil and buried itself in the poem of her smile . . . Good and wicked, cruel and compassionate, graceful and feline, she laughed . . .']

Leonardo spent four years painting at this picture, perhaps from 1503 to 1507, during his second period of residence in Florence, when he was over fifty. According to Vasari he employed the most elaborate artifices to keep the lady amused during the sittings and to retain the famous smile on her features. In its present condition the picture has preserved but little of all the delicate details which his brush reproduced on the canvas at that time; while it was being painted it was considered to be the highest that art could achieve, but it is certain that Leonardo himself was not satisfied with it, declaring it to be incomplete, and did not deliver it to the person who had commissioned it, but took it to France with him, where his patron, Francis I, acquired it from him for the Louvre.

Let us leave unsolved the riddle of the expression on Mona Lisa's face, and note the indisputable fact that her smile exercised no less powerful a fascination on the artist than on all who have looked at it for the last four hundred years. From that date the captivating smile reappears in all his pictures and in those of his pupils. As Leonardo's Mona Lisa is a portrait, we cannot assume that he added on his own account such an expressive feature to her face - a feature that she did not herself possess. The conclusion seems hardly to be avoided that he found this smile in his model and fell so strongly under its spell that from then on he bestowed it on the free creations of his phantasy. This interpretation, which cannot be called far-fetched, is put forward, for example, by Konstantinowa (1907, 44):

'During the long period in which the artist was occupied with the portrait of Mona Lisa del Giocondo, he had entered into the subtle details of the features on this lady's face with such sympathetic feeling that he transferred its traits - in particular the mysterious smile and the strange gaze - to all the faces that he painted or drew afterwards. The Gioconda's peculiar facial expression can even be perceived in the picture of John the Baptist in the Louvre; but above all it may be clearly recognized in the expression on Mary's face in the "Madonna and Child with St. Anne".'

Yet this situation may also have come about in another way. The need for a deeper reason behind the attraction of La Gioconda's smile, which so moved the artist that he was never again free from it, has been felt by more than one of his biographers. Walter Pater, who sees in the picture of Mona Lisa a 'presence . . . expressive of what in the ways of a thousand years men had come to desire', and who writes very sensitively of 'the unfathomable smile, always with a touch of something sinister in it, which plays over all Leonardo's work', leads us to another clue when he declares (*loc. cit.*):

'Besides, the picture is a portrait. From childhood we see this image defining itself on the fabric of his dreams; and but for express historical testimony, we might fancy that this was but his ideal lady, embodied and beheld at last . . .'

Marie Herzfeld (1906, 88) has no doubt something very similar in mind when she declares that in the Mona Lisa Leonardo encountered his own self and for this reason was able to put so much of his own nature into the picture 'whose features had lain all along in mysterious sympathy within Leonardo's mind'.

Let us attempt to clarify what is suggested here. It may very well have been that Leonardo was fascinated by Mona Lisa's smile for the reason that it awoke something in him which had for long lain dormant in his mind - probably an old memory. This memory was of sufficient importance for him never to get free of it when it had once been aroused; he was continually forced to give it new expression. Pater's confident assertion that we can see, from childhood, a face like Mona Lisa's defining itself on the fabric of his dreams, seems convincing and deserves to be taken literally.

Vasari mentions that 'teste di femmine, che ridono'¹ formed the subject of Leonardo's first artistic endeavours. The passage - which, since it is not intended to prove anything, is quite beyond suspicion - runs more fully according to Schorn's translation (1843, 3, 6): 'In his youth he made some heads of laughing women out of clay, which were reproduced in plaster, and some children's heads which were as beautiful as if they had been modelled by the hand of a master . . .'

Thus we learn that he began his artistic career by portraying two kinds of objects; and these cannot fail to remind us of the two kinds of sexual objects that we have inferred from the analysis of his vulture-phantasy. If the beautiful children's heads were reproductions of his own person as it was in his childhood, then the smiling women are nothing other than repetitions of his mother Caterina, and we begin to suspect the possibility that it was his mother who possessed the mysterious smile - the smile that he had lost and that fascinated him so much when he found it again in the Florentine lady.²

The painting of Leonardo's which stands nearest to the Mona Lisa in point of time is the so-called 'St. Anne with Two Others', St. Anne with the Madonna and child. In it the Leonardesque smile is most beautifully and markedly portrayed on both the women's faces. It is not possible to discover how long before or after the painting of the Mona Lisa Leonardo began to paint this picture. As both works extended over years, it may, I think, be assumed that the artist was engaged on them at the same time. It would best agree with our expectation if it was the intensity of Leonardo's preoccupation with the features of Mona Lisa which stimulated him to create the composition of St. Anne out of his phantasy. For if the Gioconda's smile called up in his mind the memory of his mother, it is easy to understand how it drove him at once to create a glorification of motherhood, and to give back to his mother the smile he had found in the noble lady. We may therefore permit our interest to pass from Mona Lisa's portrait to this other picture - one which is hardly less beautiful, and which to-day also hangs in the Louvre.

¹ ['Heads of laughing women.'] Quoted by Scognamiglio (1900, 32).

² The same assumption is made by Merezhkovsky. But the history of Leonardo's childhood as he imagines it departs at the essential points from the conclusions we have drawn from the phantasy of the vulture. Yet if the smile had been that of Leonardo himself tradition would hardly have failed to inform us of the coincidence.

St. Anne with her daughter and her grandchild is a subject that is rarely handled in Italian painting. At all events Leonardo's treatment of it differs widely from all other known versions. Muther (1909, 1, 309) writes:

'Some artists, like Hans Fries, the elder Holbein and Girolamo dai Libri, made Anne sit beside Mary and put the child between them. Others, like Jakob Cornelisz in his Berlin picture, painted what was truly a "St. Anne with Two Others"; in other words, they represented her as holding in her arms the small figure of Mary upon which the still smaller figure of the child Christ is sitting.' In Leonardo's picture Mary is sitting on her mother's lap, leaning forward, and is stretching out both arms towards the boy, who is playing with a young lamb and perhaps treating it a little unkindly. The grandmother rests on her hip the arm that is not concealed and gazes down on the pair with a blissful smile. The grouping is certainly not entirely unconstrained. But although the smile that plays on the lips of the two women is unmistakably the same as that in the picture of Mona Lisa, it has lost its uncanny and mysterious character; what it expresses is inward feeling and quiet blissfulness.¹

After we have studied this picture for some time, it suddenly dawns on us that only Leonardo could have painted it, just as only he could have created the phantasy of the vulture. The picture contains the synthesis of the history of his childhood: its details are to be explained by reference to the most personal impressions in Leonardo's life. In his father's house he found not only his kind stepmother, Donna Albiera, but also his grandmother, his father's mother, Monna Lucia, who - so we will assume - was no less tender to him than grandmothers usually are. These circumstances might well suggest to him a picture representing childhood watched over by mother and grandmother. Another striking feature of the picture assumes even greater significance. St. Anne, Mary's mother and the boy's grandmother, who must have been a matron, is here portrayed as being perhaps a little more mature and serious than the Virgin Mary, but as still being a young woman of unfaded beauty. In point of fact Leonardo has given the boy two mothers, one who stretches her arms out to him, and another in the background; and both are endowed with the blissful smile of the joy of motherhood. This peculiarity of the picture has not failed to surprise those who have written about it; Muther, for example, is of the opinion that Leonardo could not bring himself to paint old age, lines and wrinkles, and for this reason made Anne too into a woman of radiant beauty. But can we be satisfied with this explanation? Others have had recourse to denying that there is any similarity in age between the mother and daughter.² But Muther's attempt at an explanation is surely enough to prove that the impression that St. Anne has been made more youthful derives from the picture and is not an invention for an ulterior purpose.

¹ Konstantinowa (1907): 'Mary gazes down full of inward feeling on her darling, with a smile that recalls the mysterious expression of La Gioconda.' In another passage she says of Mary: 'The Gioconda's smile hovers on her features.'

² Von Seidlitz (1909, 2, 274, notes).

Leonardo's childhood was remarkable in precisely the same way as this picture. He had had two mothers: first, his true mother Caterina, from whom he was torn away when he was between three and five, and then a young and tender stepmother, his father's wife, Donna Albiera. By his combining this fact about his childhood with the one mentioned above (the presence of his mother and grandmother) and by his condensing them into a composite unity, the design of 'St. Anne with Two Others' took shape for him. The maternal figure that is further away from the boy - the grandmother - corresponds to the earlier and true mother, Caterina, in its appearance and in its special relation to the boy. The artist seems to have used the blissful smile of St. Anne to disavow and to cloak the envy which the unfortunate woman felt when she was forced to give up her son to her better-born rival, as she had once given up his father as well.¹

¹ [Footnote added 1919:] If an attempt is made to separate the figures of Anne and Mary in this picture and to trace the outline of each, it will not be found altogether easy. One is inclined to say that they are fused with each other like badly condensed dream-figures, so that in some places it is hard to say where Anne ends and where Mary begins. But what appears to a critic's eye as a fault, as a defect in composition, is vindicated in the eyes of analysis by reference to its secret meaning. It seems that for the artist the two mothers of his childhood were melted into a single form.

[Added 1923:] It is especially tempting to compare the 'St. Anne with Two Others' of the Louvre with the celebrated London cartoon, where the same material is used to form a different composition. Here the forms of the two mothers are fused even more closely and their separate outlines are even harder to make out, so that critics, far removed from any attempt to offer an interpretation, have been forced to say that it seems 'as if two heads were growing from a single body'.

Fig. 2.

Most authorities are in agreement in pronouncing the London cartoon to be the earlier work and in assigning its origin to Leonardo's first period in Milan (before 1500). Adolf Rosenberg (1898), on the other hand, sees the composition of the cartoon as a later - and more successful - version of the same theme, and follows Anton Springer in dating it even after the Mona Lisa. It would fit in excellently with our arguments if the cartoon were to be much the earlier work. It is also not hard to imagine how the picture in the Louvre arose out of the cartoon, while the reverse course of events would make to sense. If we take the composition shown in the cartoon as our starting point, we can see how Leonardo may have felt the need to undo the dream-like fusion of the two women - a fusion corresponding to his childhood memory - and to separate the two heads in space. This came about as follows: From the group formed by the mothers he detached Mary's head and the upper part of her body and bent them downwards. To provide a reason for this displacement the child Christ had to come down from her lap on to the ground. There was then no room for the little St. John, who was replaced by the lamb.

[Added 1919:] A remarkable discovery has been made in the Louvre picture by Oskar Pfister, which is of undeniable interest, even if one may not feel inclined to accept it without reserve. In Mary's curiously arranged and rather confusing drapery he has discovered the *outline of a vulture* and he interprets it as an *unconscious picture-puzzle*:-

'In the picture that represents the artist's mother *the vulture, the symbol of motherhood*, is perfectly clearly visible.

'In the length of blue cloth, which is visible around the hip of the woman in front and which extends in the direction of her lap and her right knee, one can see the vulture's extremely characteristic head, its neck and the sharp curve where its body begins. Hardly any observer whom I have confronted with my little find has been able to resist the evidence of this picture-puzzle.' (Pfister, 1913, 147.)

Leonardo Da Vinci And A Memory Of His Childhood

At this point the reader will not, I feel sure, grudge the effort of looking at the accompanying illustration, to see if he can find in it the outlines of the vulture seen by Pfister. The piece of blue cloth, whose border marks the edges of the picture-puzzle, stands out in the reproduction as a light grey field against the darker ground of the rest of the drapery.

Fig. 3.

Pfister continues: 'The important question however is: How far does the picture-puzzle extend? If we follow the length of cloth, which stands out so sharply from its surroundings, starting at the middle of the wing and continuing from there, we notice that one part of it runs down to the woman's foot, while the other part extends in an upward direction and rests on her shoulder and on the child. The former of these parts might more or less represent the vulture's wing and tail, as it is in nature; the latter might be a pointed belly and - especially when we notice the radiating lines which resemble the outlines of feathers - a bird's outspread tail, whose right-hand end, *exactly as in Leonardo's fateful childhood dream* [sic], *leads to the mouth of the child, i.e. of Leonardo himself.*'

The author goes on to examine the interpretation in greater detail, and discusses the difficulties to which it gives rise.

We thus find a confirmation in another of Leonardo's works of our suspicion that the smile of Mona Lisa del Giocondo had awakened in him as a grown man the memory of the mother of his earliest childhood. From that time onward, madonnas and aristocratic ladies were depicted in Italian painting humbly bowing their heads and smiling the strange, blissful smile of Caterina, the poor peasant girl who had brought into the world the splendid son who was destined to paint, to search and to suffer.

If Leonardo was successful in reproducing on Mona Lisa's face the double meaning which this smile contained, the promise of unbounded tenderness and at the same time sinister menace (to quote Pater's phrase), then here too he had remained true to the content of his earliest memory. For his mother's tenderness was fateful for him; it determined his destiny and the privations that were in store for him. The violence of the caresses, to which his phantasy of the vulture points, was only too natural. In her love for her child the poor forsaken mother had to give vent to all her memories of the caresses she had enjoyed as well as her longing for new ones; and she was forced to do so not only to compensate herself for having no husband, but also to compensate her child for having no father to fondle him. So, like all unsatisfied mothers, she took her little son in place of her husband, and by the too early maturing of his erotism robbed him of a part of his masculinity. A mother's love for the infant she suckles and cares for is something far more profound than her later affection for the growing child. It is in the nature of a completely satisfying love-relation, which not only fulfils every mental wish but also every physical need; and if it represents one of the forms of attainable human happiness, that is in no little measure due to the possibility it offers of satisfying, without reproach, wishful impulses which have long been repressed and which must be called perverse.¹ In the happiest young marriage the father is aware that the baby, especially if he is a baby son, has become his rival, and this is the starting-point of an antagonism towards the favourite which is deeply rooted in the unconscious.

¹ See my *Three Essays on the Theory of Sexuality* (1905d).

When, in the prime of life, Leonardo once more encountered the smile of bliss and rapture which had once played on his mother's lips as she fondled him, he had for long been under the dominance of an inhibition which forbade him ever again to desire such caresses from the lips of women. But he had become a painter, and therefore he strove to reproduce the smile with his brush, giving it to all his pictures (whether he in fact executed them himself or had them done by his pupils under his direction) - to Leda, to John the Baptist and to Bacchus. The last two are variants of the same type. 'Leonardo has turned the locust-eater of the Bible', says Muther, 'into a Bacchus, a young Apollo, who, with a mysterious smile on his lips, and with his smooth legs crossed, gazes at us with eyes that intoxicate the senses.' These pictures breathe a mystical air into whose secret one dares not penetrate; at the very most one can attempt to establish their connection with Leonardo's earlier creations. The figures are still androgynous, but no longer in the sense of the vulture-phantasy. They are beautiful youths of feminine delicacy and with effeminate forms; they do not cast their eyes down, but gaze in mysterious triumph, as if they knew of a great achievement of happiness, about which silence must be kept. The familiar smile of fascination leads one to guess that it is a secret of love. It is possible that in these figures Leonardo has denied the unhappiness of his erotic life and has triumphed over it in his art, by representing the wishes of the boy, infatuated with his mother, as fulfilled in this blissful union of the male and female natures.

V

Among the entries in Leonardo's notebooks there is one which catches the reader's attention owing to the importance of what it contains and to a minute formal error.

In July 1504 he writes:

'Adì 9 di Luglio 1504 mercoledì a ore 7 morì Ser Piero da Vinci, notalio al palazzo del Potestà, mio padre, a ore 7. Era d'età d'anni 80, lasciò 10 figlioli maschi e 2 femmine.'¹

As we see, the note refers to the death of Leonardo's father. The small error in its form consists of the repetition of the time of day 'a ore 7' [at 7 o'clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psycho-analyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like, that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

We would say that this note, like the account for Caterina's funeral and the bills of the pupils' expenses, is a case in which Leonardo was unsuccessful in suppressing his affect and in which something that had long been concealed forcibly obtained a distorted expression. Even the form is similar: there is the same pedantic exactness, and the same prominence given to numbers.²

¹ ['On July 9, 1504, Wednesday at 7 o'clock died Ser Piero da Vinci, notary at the palace of the Podestà, my father, at 7 o'clock. He was 80 years old, and left 10 sons and 2 daughters.'] After Müntz (1899, 13 *n.*).

² I am leaving on one side a greater error made by Leonardo in this note by giving his father's age as 80 instead of 77.

We call a repetition of this kind a perseveration. It is an excellent means of indicating affective colour. One recalls, for example, St. Peter's tirade in Dante's *Paradiso* against his unworthy representative on earth:

Quegli ch'usurpa in terra il luogo mio,
Il luogo mio, il luogo mio, che vaca
Nella presenza del Figliuol di Dio,

Fatto ha del cimiterio mio cloaca.¹

Without Leonardo's affective inhibition the entry in his diary might have run somewhat as follows: 'To-day at 7 o'clock my father died - Ser Piero da Vinci, my poor father!' But the displacement of the perseveration on to the most indifferent detail in the report of his death, the hour at which he died, robs the entry of all emotion, and further lets us see that here was something to be concealed and suppressed.

Ser Piero da Vinci, notary and descendant of notaries, was a man of great energy who reached a position of esteem and prosperity. He was married four times. His first two wives died childless, and it was only his third wife who presented him with his first legitimate son, in 1476, by which time Leonardo had reached the age of 24 and had long ago exchanged his father's home for the studio of his master Verrocchio. By his fourth and last wife, whom he married when he was already in his fifties, he had nine more sons and two daughters.²

It cannot be doubted that his father too came to play an important part in Leonardo's psychosexual development, and not only negatively by his absence during the boy's first childhood years, but also directly by his presence in the later part of Leonardo's childhood. No one who as a child desires his mother can escape wanting to put himself in his father's place, can fail to identify himself with him in his imagination, and later to make it his task in life to gain ascendancy over him. When Leonardo was received into his grandfather's house before he had reached the age of five, his young step-mother Albiera must certainly have taken his mother's place where his feelings were concerned, and he must have found himself in what may be called the normal relationship of rivalry with his father. As we know, a decision in favour of homosexuality only takes place round about the years of puberty. When this decision had been arrived at in Leonardo's case, his identification with his father lost all significance for his sexual life, but it nevertheless continued in other spheres of non-erotic activity. We hear that he was fond of magnificence and fine clothes, and kept servants and horses, although, in Vasari's words, 'he possessed almost nothing and did little work'. The responsibility for these tastes is not to be attributed solely to his feeling for beauty: we recognize in them at the same time a compulsion to copy and to outdo his father. His father had been a great gentleman to the poor peasant girl, and the son, therefore, never ceased to feel the spur to play the great gentleman as well, the urge 'to out-herod Herod',³ to show his father what a great gentleman really looks like.

¹ ['He who usurps on earth my place, my place, my place, which in the presence of the Son of God is vacant, has made a sewer of the ground where I am buried.'] Canto XXVII, 22-25.

² Leonardo has apparently made a further mistake in this passage in his diary over the number of his brothers and sisters - a remarkable contrast to the apparent exactness of the passage.

³ [The last three words are in English in the original.]

There is no doubt that the creative artist feels towards his works like a father. The effect which Leonardo's identification with his father had on his paintings was a fateful one. He created them and then cared no more about them, just as his father had not cared about him. His father's later concern could change nothing in this compulsion; for the compulsion derived from the impressions of the first years of childhood, and what has been repressed and has remained unconscious cannot be corrected by later experiences.

In the days of the Renaissance -(and even much later - every artist stood in need of a gentleman of rank, a benefactor and patron, who gave him commissions and in whose hands his fortune rested. Leonardo found his patron in Lodovico Sforza, called Il Moro, a man of ambition and a lover of splendour, astute in diplomacy, but of erratic and unreliable character. At his court in Milan Leonardo passed the most brilliant period of his life, and in his service his creative power attained its most uninhibited expansion, to which the Last Supper and the equestrian statue of Francesco Sforza bore witness. He left Milan before catastrophe overtook Lodovico Sforza, who died a prisoner in a French dungeon. When the news of his patron's fate reached Leonardo, he wrote in his diary: 'The duke lost his dukedom and his property and his liberty, and none of the works that he undertook was completed.'¹ It is remarkable, and certainly not without significance, that he here cast the same reproach at his patron which posterity was to bring against himself. It is as if he wanted to make someone from the class of his fathers responsible for the fact that he himself left his works unfinished. In point of fact he was not wrong in what he said about the duke.

¹ 'Il duca perse to stato e la roba e libertà e nessuna sua opera si finì per lui.' Quoted by Von Seidlitz (1909, 2, 270).

But if his imitation of his father did him damage as an artist, his rebellion against his father was the infantile determinant of what was perhaps an equally sublime achievement in the field of scientific research. In Merezhkovsky's admirable simile (1903, 348), he was like a man who had awoken too early in the darkness, while everyone else was still asleep. He dared to utter the bold assertion which contains within itself the justification for all independent research: *'He who appeals to authority when there is a difference of opinion works with his memory rather than with his reason.'*¹ Thus he became the first modern natural scientist, and an abundance of discoveries and suggestive ideas rewarded his courage for being the first man since the time of the Greeks to probe the secrets of nature while relying solely on observation and his own judgement. But in teaching that authority should be looked down on and that imitation of the 'ancients' should be repudiated, and in constantly urging that the study of nature was the source of all truth, he was merely repeating - in the highest sublimation attainable by man - the one-sided point of view which had already forced itself on the little boy as he gazed in wonder on the world. If we translate scientific abstraction back again into concrete individual experience, we see that the 'ancients' and authority simply correspond to his father, and nature once more becomes the tender and kindly mother who had nourished him. In most other human beings - no less to-day than in primaeval times - the need for support from an authority of some sort is so compelling that their world begins to totter if that authority is threatened. Only Leonardo could dispense with that support; he would not have been able to do so had he not learnt in the first years of his life to do without his father. His later scientific research, with all its boldness and independence, presupposed the existence of infantile sexual researches uninhibited by his father, and was a prolongation of them with the sexual element excluded.

¹ 'Chi disputa allegando l'autorità non adopra l'ingegno ma piuttosto la memoria.' Quoted by Solmi (1910, 13).

When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

It does not seem as if the instance of Leonardo could show this view of religious belief to be mistaken. Accusations charging him with unbelief or (what at that time came to the same thing) with apostasy from Christianity were brought against him while he was still alive, and are clearly described in the first biography which Vasari wrote of him, (Müntz, 1899, 292 ff.) In the second (1568) edition of his *Vite* Vasari omitted these observations. In view of the extraordinary sensitiveness of his age where religious matters were in question, we can understand perfectly why even in his notebooks Leonardo should have refrained from directly stating his attitude to Christianity. In his researches he did not allow himself to be led astray in the slightest degree by the account of the Creation in Holy Writ; he challenged, for example, the possibility of a universal Deluge, and in geology he calculated in terms of hundreds of thousands of years with no more hesitation than men in modern times.

Among his 'prophecies' there are some things that would have been bound to offend the sensitive feelings of a Christian believer. Take for example, 'On the practice of praying to the images of saints':

'Men will speak to men that perceive nothing, that have their eyes open and see nothing; they will talk to them and receive no answer; they will implore the grace of those that have ears and hear not; they will kindle lights for one that is blind.' (After Herzfeld, 1906, 292.)

Or 'On the mourning on Good Friday':

'In every part of Europe great people will weep for the death of a single man who died in the East.' (Ibid., 297.)

The view has been expressed about Leonardo's art that he took from the sacred figures the last remnant of their connection with the Church and made them human, so as to represent by their means great and beautiful human emotions. Muther praises him for overcoming the prevailing mood of decadence and for restoring to man his right to sensuality and the joy of living. In the notes that show Leonardo engrossed in fathoming the great riddles of nature there is no lack of passages where he expresses his admiration for the Creator, the ultimate cause of all these noble secrets; but there is nothing which indicates that he wished to maintain any personal relation with this divine power. The reflections in which he has recorded the deep wisdom of his last years of life breathe the resignation of the human being who subjects himself to 'Ανάγκη', to the laws of nature, and who expects no alleviation from the goodness or grace of God. There is scarcely any doubt that Leonardo had prevailed over both dogmatic and personal religion, and had by his work of research removed himself far from the position from which the Christian believer surveys the world.

The findings, mentioned above, which we have reached concerning the development of the mental life of children suggest the view that in Leonardo's case too the first researches of childhood were concerned with the problems of sexuality. Indeed he himself gives this away in a transparent disguise by connecting his urge for research with the vulture phantasy, and by singling out the problem of the flight of birds as one to which, as the result of a special chain of circumstances, he was destined to turn his attention. A highly obscure passage in his notes which is concerned with the flight of birds, and which sounds like a prophecy, gives a very good demonstration of the degree of affective interest with which he clung to his wish to succeed in imitating the art of flying himself: 'The great bird will take its first flight from the back of its Great Swan; it will fill the universe with stupefaction, and all writings with renown, and be the eternal glory of the nest where it was born.'¹ He probably hoped that he himself would be able to fly one day, and we know from wish-fulfilling dreams what bliss is expected from the fulfilment of that hope.

But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is '*vögeln*' ['to bird': '*Vogel* is the German for 'bird']; that the male organ is actually called '*l'uccello*' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which *they* are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

¹ After Herzfeld (1906, 32). 'The Great Swan' seems to mean Monte Cecero, a hill near Florence.

² [Footnote added 1919:] This statement is based on the researches of Paul Federn and of Mourly Vold (1912), a Norwegian man of science who had no contact with psycho-analysis.

In admitting to us that ever since his childhood he felt bound up in a special and personal way with the problem of flight, Leonardo gives us confirmation that his childhood researches were directed to sexual matters; and this is what we were bound to expect as a result of our investigations on children in our own time. Here was one problem at least which had escaped the repression that later estranged him from sexuality. With slight changes in meaning, the same subject continued to interest him from his years of childhood until the time of his most complete intellectual maturity; and it may very well be that the skill that he desired was no more attainable by him in its primary sexual sense than in its mechanical one, and that he remained frustrated in both wishes.

Indeed, the great Leonardo remained like a child for the whole of his life in more than one way; it is said that all great men are bound to retain some infantile part. Even as an adult he continued to play, and this was another reason why he often appeared uncanny and incomprehensible to his contemporaries. It is only we who are unsatisfied that he should have constructed the most elaborate mechanical toys for court festivities and ceremonial receptions, for we are reluctant to see the artist turning his power to such trifles. He himself seems to have shown no unwillingness to spend his time thus, for Vasari tells us that he made similar things when he had not been commissioned to do so: 'There (in Rome) he got a soft lump of wax, and made very delicate animals out of it, filled with air; when he blew into them they flew around, and when the air ran out they fell to the ground. For a peculiar lizard which was found by the wine-grower of Belvedere he made wings from skin torn from other lizards, and filled them with quicksilver, so that they moved and quivered when it walked. Next he made eyes, a beard and horns for it, tamed it and put it in a box and terrified all his friends with it.'¹ Such ingenuities often served to express thoughts of a serious kind. 'He often had a sheep's intestines cleaned so carefully that they could have been held in the hollow of the hand. He carried them into a large room, took a pair of blacksmith's bellows into an adjoining room, fastened the intestines to them and blew them up, until they took up the whole room and forced people to take refuge in a corner. In this way he showed how they gradually became transparent and filled with air; and from the fact that at first they were limited to a small space and gradually spread through the whole breadth of the room, he compared them to genius.'² The same playful delight in harmlessly concealing things and giving them ingenious disguises is illustrated by his fables and riddles. The latter are cast into the form of 'prophecies': almost all are rich in ideas and to a striking degree devoid of any element of wit.

¹ Vasari, from Schorn's translation (1843, 39).

² Ibid., 39.

The games and pranks which Leonardo allowed his imagination have in some cases led his biographers, who misunderstood this side of his character, grievously astray. In Leonardo's Milanese manuscripts there are, for example, some drafts of letters to the 'Diodario of Sorio (Syria), Viceroy of the Holy Sultan of Babylonia', in which Leonardo presents himself as an engineer sent to those regions of the East to construct certain works; defends himself against the charge of laziness; supplies geographical descriptions of towns and mountains, and concludes with an account of a great natural phenomenon that occurred while he was there.¹

In 1883 an attempt was made by J. P. Richter to prove from these documents that it was really a fact that Leonardo had made these observations while travelling in the service of the Sultan of Egypt, and had even adopted the Mohammedan religion when in the East. On this view his visit there took place in the period before 1483 - that is, before he took up residence at the court of the Duke of Milan. But the acumen of other authors has had no difficulty in recognizing the evidences of Leonardo's supposed Eastern journey for what they are - imaginary productions of the youthful artist, which he created for his own amusement and in which he may have found expression for a wish to see the world and meet with adventures.

Another probable example of a creation of his imagination is to be found in the 'Accademia Vinciana' which has been postulated from the existence of five or six emblems, intertwined patterns of extreme intricacy, which contain the Academy's name. Vasari mentions these designs but not the Academy.² Müntz, who put one of these ornaments on the cover of his large work on Leonardo, is among the few who believe in the reality of an 'Accademia Vinciana'.

It is probable that Leonardo's play-instinct vanished in his maturer years, and that it too found its way into the activity of research which represented the latest and highest expansion of his personality. But its long duration can teach us how slowly anyone tears himself from his childhood if in his childhood days he has enjoyed the highest erotic bliss, which is never again attained.

¹ For these letters and the various questions connected with them see Müntz (1899, 82 ff.); the actual texts and other related notes will be found in Herzfeld (1906, 223 ff.).

² 'Besides, he lost some time by even making a drawing of knots of cords, in which it was possible to trace the thread from one end to the other until it formed a completely circular figure. A very complex and beautiful design of this sort is engraved on copper; in the middle can be read the words "Leonardus Vinci Accademia".' Schorn (1843, 8).

VI

It would be futile to blind ourselves to the fact that readers to-day find all pathography unpalatable. They clothe their aversion in the complaint that a pathographical review of a great man never results in an understanding of his importance and his achievements, and that it is therefore a piece of useless impertinence to make a study of things in him that could just as easily be found in the first person one came across. But this criticism is so manifestly unjust that it is only understandable when taken as a pretext and a disguise. (Pathography does not in the least aim at making the great man's achievements intelligible; and surely no one should be blamed for not carrying out something he has never promised to do. The real motives for the opposition are different. We can discover them if we bear in mind that biographers are fixated on their heroes in a quite special way. In many cases they have chosen their hero as the subject of their studies because - for reasons of their personal emotional life - they have felt a special affection for him from the very first. They then devote their energies to a task of idealization, aimed at enrolling the great man among the class of their infantile models - at reviving in him, perhaps, the child's idea of his father. To gratify this wish they obliterate the individual features of their subject's physiognomy; they smooth over the traces of his life's struggles with internal and external resistances, and they tolerate in him no vestige of human weakness or imperfection. They thus present us with what is in fact a cold, strange, ideal figure, instead of a human being to whom we might feel ourselves distantly related. That they should do this is regrettable, for they thereby sacrifice truth to an illusion, and for the sake of their infantile phantasies abandon the opportunity of penetrating the most fascinating secrets of human nature.¹

Leonardo himself, with his love of truth and his thirst for knowledge, would not have discouraged an attempt to take the trivial peculiarities and riddles in his nature as a starting-point, for discovering what determined his mental and intellectual development. We do homage to him by learning from him. It does not detract from his greatness if we make a study of the sacrifices which his development from childhood must have entailed, and if we bring together the factors which have stamped him with the tragic mark of failure.

¹ This criticism applies quite generally and is not to be taken as being aimed at Leonardo's biographers in particular.

We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have to-day rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. To-day we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional'; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'.

The aim of our work has been to explain the inhibitions in Leonardo's sexual life and in his artistic activity. With this in view we may be allowed to summarize what we have been able to discover about the course of his psychical development.

We have no information about the circumstances of his heredity; on the other hand we have seen that the accidental conditions of his childhood had a profound and disturbing effect on him. His illegitimate birth deprived him of his father's influence until perhaps his fifth year, and left him open to the tender seductions of a mother whose only solace he was. After being kissed by her into precocious sexual maturity, he must no doubt have embarked on a phase of infantile sexual activity of which only one single manifestation is definitely attested - the intensity of his infantile sexual researches. The instinct to look and the instinct to know were those most strongly excited by the impressions of his early childhood; the erotogenic zone of the mouth was given an emphasis which it never afterwards surrendered. From his later behaviour in the contrary direction, such as his exaggerated sympathy for animals, we can conclude that there was no lack of strong sadistic traits in this period of his childhood.

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.

Leonardo emerges from the obscurity of his boyhood as an artist, a painter and a sculptor, owing to a specific talent which may have been reinforced by the precocious awakening in the first years of childhood of his scopophilic instinct. We should be most glad to give an account of the way in which artistic activity derives from the primal instincts of the mind if it were not just here that our capacities fail us. We must be content to emphasize the fact - which it is hardly any longer possible to doubt - that what an artist creates provides at the same time an outlet for his sexual desire; and in Leonardo's case we can point to the information which comes from Vasari, that heads of laughing women and beautiful boys - in other words, representations of his sexual objects - were notable among his first artistic endeavours. In the bloom of his youth Leonardo appears at first to have worked without inhibition. Just as he modelled himself on his father in the outward conduct of his life, so too he passed through a period of masculine creative power and artistic productiveness in Milan, where a kindly fate enabled him to find a father substitute in the duke Lodovico Moro. But soon we find confirmation of our experience that the almost total repression of a real sexual life does not provide the most favourable conditions for the exercise of sublimated sexual trends. The pattern imposed by sexual life made itself felt. His activity and his ability to form quick decisions began to fail; his tendency towards deliberation and delay was already noticeable as a disturbing element in the 'Last Supper', and by influencing his technique it had a decisive effect on the fate of that great painting. Slowly there occurred in him a process which can only be compared to the regressions in neurotics. The development that turned him into an artist at puberty was overtaken by the process which led him to be an investigator, and which had its determinants in early infancy. The second sublimation of his erotic instinct gave place to the original sublimation for which the way had been prepared on the occasion of the first repression. He became an investigator, at first still in the service of his art, but later independently of it and away from it. With the loss of his patron, the substitute for his father, and with the increasingly sombre colours which his life took on, this regressive shift assumed larger and larger proportions. He became '*impacientissimo al pennello*',¹ as we are told by a correspondent of the Countess Isabella d'Este, who was extremely eager to possess a painting from his hand. His infantile past had gained control over him. But the research which now took the place of artistic creation seems to have contained some of the features which distinguish the activity of unconscious instincts - insatiability, unyielding rigidity and the lack of an ability to adapt to real circumstances.

¹ ['Very impatient of painting.'] Von Seidlitz (1909, 2, 271).

At the summit of his life, when he was in his early fifties - a time when in women the sexual characters have already under gone involution and when in men the libido not infrequently makes a further energetic advance - a new transformation came over him. Still deeper layers of the contents of his mind became active once more: but this further regression was to the benefit of his art, which was in the process of becoming stunted. He met the woman who awakened his memory of his mother's happy smile of sensual rapture; and, influenced by this revived memory, he recovered the stimulus that guided him at the beginning of his artistic endeavours, at the time when he modelled the smiling women. He painted the Mona Lisa, the 'St. Anne with Two Others' and the series of mysterious pictures which are characterized by the enigmatic smile. With the help of the oldest of all his erotic impulses he enjoyed the triumph of once more conquering the inhibition in his art. This final development is obscured from our eyes in the shadows of approaching age. Before this his intellect had soared upwards to the highest realizations of a conception of the world that left his epoch far behind it.

In the preceding chapters I have shown what justification can be found for giving this picture of Leonardo's course of development - for proposing these subdivisions of his life and for explaining his vacillation between art and science in this way. If in making these statements I have provoked the criticism, even from friends of psycho-analysis and from those who are expert in it, that I have merely written a psycho-analytic novel, I shall reply that I am far from over-estimating the certainty of these results. Like others I have succumbed to the attraction of this great and mysterious man, in whose nature one seems to detect powerful instinctual passions which can nevertheless only express themselves in so remarkably subdued a manner.

But whatever the truth about Leonardo's life may be, we cannot desist from our endeavour to find a psycho-analytic explanation for it until we have completed another task. We must stake out in a quite general way the limits which are set to what psycho-analysis can achieve in the field of biography: otherwise every explanation that is not forthcoming will be held up to us as a failure. The material at the disposal of a psycho-analytic enquiry consists of the data of a person's life history: on the one hand the chance circumstances of events and background influences, and, on the other hand, the subject's reported reactions. Supported by its knowledge of psychical mechanisms it then endeavours to establish a dynamic basis for his nature on the strength of his reactions, and to disclose the original motive forces of his mind, as well as their later transformations and developments. If this is successful the behaviour of a personality in the course of his life is explained in terms of the combined operation of constitution and fate, of internal forces and external powers. Where such an undertaking does not provide any certain results - and this is perhaps so in Leonardo's case - the blame rests not with the faulty or inadequate methods of psycho-analysis, but with the uncertainty and fragmentary nature of the material relating to him which tradition makes available. It is therefore only the author who is to be held responsible for the failure, by having forced psycho-analysis to pronounce an expert opinion on the basis of such insufficient material.

But even if the historical material at our disposal were very abundant, and if the psychical mechanisms could be dealt with with the greatest assurance, there are two important points at which a psycho-analytic enquiry would not be able to make us understand how inevitable it was that the person concerned should have turned out in the way he did and in no other way. In Leonardo's case we have had to maintain the view that the accident of his illegitimate birth and the excessive tenderness of his mother had the most decisive influence on the formation of his character and on his later fortune, since the sexual repression which set in after this phase of childhood caused him to sublimate his libido into the urge to know, and established his sexual inactivity for the whole of his later life. But this repression after the first erotic satisfactions of childhood need not necessarily have taken place; in someone else it might perhaps not have taken place or might have assumed much less extensive proportions. We must recognize here a degree of freedom which cannot be resolved any further by psycho-analytic means. Equally, one has no right to claim that the consequence of this wave of repression was the only possible one. It is probable that another person would not have succeeded in withdrawing the major portion of his libido from repression by sublimating it into a craving for knowledge; under the same influences he would have sustained a permanent injury to his intellectual activity or have acquired an insurmountable disposition to obsessional neurosis. We are left, then, with these two characteristics of Leonardo which are inexplicable by the efforts of psycho-analysis: his quite special tendency towards instinctual repressions, and his extraordinary capacity for sublimating the primitive instincts.

Instincts and their transformations are at the limit of what is discernible by psycho-analysis. From that point it gives place to biological research. We are obliged to look for the source of the tendency to repression and the capacity for sublimation in the organic foundations of character on which the mental structure is only afterwards erected. Since artistic talent and capacity are intimately connected with sublimation we must admit that the nature of the artistic function is also inaccessible to us along psycho-analytic lines. The tendency of biological research to-day is to explain the chief features in a person's organic constitution as being the result of the blending of male and female dispositions, based on substances. Leonardo's physical beauty and his left-handedness might be quoted in support of this view. We will not, however, leave the ground of purely psychological research. Our aim remains that of demonstrating the connection along the path of instinctual activity between a person's external experiences and his reactions. Even if psycho-analysis does not throw light on the fact of Leonardo's artistic power, it at least renders its manifestations and its limitations intelligible to us. It seems at any rate as if only a man who had had Leonardo's childhood experiences could have painted the Mona Lisa and the St. Anne, have secured so melancholy a fate for his works and have embarked on such an astonishing career as a natural scientist, as if the key to all his achievements and misfortunes lay hidden in the childhood phantasy of the vulture.

But may one not take objection to the findings of an enquiry which ascribes to accidental circumstances of his parental constellation so decisive an influence on a person's fate - which, for example, makes Leonardo's fate depend on his illegitimate birth and on the barrenness of his first stepmother Donna Albiera? I think one has no right to do so. If one considers chance to be unworthy of determining our fate, it is simply a relapse into the pious view of the Universe which Leonardo himself was on the way to overcoming when he wrote that the sun does not move. We naturally feel hurt that a just God and a kindly providence do not protect us better from such influences during the most defenceless period of our lives. At the same time we are all too ready to forget that in fact everything to do with our life is chance, from our origin out of the meeting of spermatozoon and ovum onwards - chance which nevertheless has a share in the law and necessity of nature, and which merely lacks any connection with our wishes and illusions. The apportioning of the determining factors of our life between the 'necessities' of our constitution and the 'chances' of our childhood may still be uncertain in detail; but in general it is no longer possible to doubt the importance precisely of the first years of our childhood. We all still show too little respect for Nature which (in the obscure words of Leonardo which recall Hamlet's lines) 'is full of countless causes [*ragioni*]' that never enter experience'.¹

Every one of us human beings corresponds to one of the countless experiments in which these '*ragioni*' of nature force their way into experience.

¹ '*La natura è piena d'infinite ragioni che non furono mai in isperienza*' (Herzfeld, 1906, 11).

THE FUTURE PROSPECTS OF PSYCHO-ANALYTIC THERAPY
(1910)

Intentionally left blank

THE FUTURE PROSPECTS OF PSYCHO-ANALYTIC THERAPY

GENTLEMEN, - Since the objects for which we are assembled here to-day are mainly practical, I shall choose a practical theme for my introductory address and appeal to your medical, not to your scientific, interest. I can imagine your probable views on the results of our therapy, and I assume that most of you have already passed through the two stages which all beginners go through, the stage of enthusiasm at the unexpected increase in our therapeutic achievements, and the stage of depression at the magnitude of the difficulties which stand in the way of our efforts. At whatever point in this development, however, each of you may happen to be, my intention to-day is to show you that we have by no means come to the end of our resources for combating the neuroses, and that we may expect a substantial improvement in our therapeutic prospects before long.

This reinforcement will come, I think, from three directions:

- (1) from internal progress,
- (2) from increased authority, and
- (3) from the general effect of our work.

(1) Under 'internal progress' I include advances (a) in our analytic knowledge, (b) in our technique.

(a) Advances in our knowledge. We are, of course, still a long way from knowing all that is required for an understanding of the unconscious in our patients. It is clear that every advance in our knowledge means an increase in our therapeutic power. As long as we have understood nothing, we have accomplished nothing; the more we understand, the more we shall achieve. At its beginning psycho-analytic treatment was inexorable and exhausting. The patient had to say everything himself, and the physician's activity consisted of urging him on incessantly. To-day things have a more friendly air. The treatment is made up of two parts - what the physician infers and tells the patient, and the patient's working-over of what he has heard. The mechanism of our assistance is easy to understand: we give the patient the conscious anticipatory idea and he then finds the repressed unconscious idea in himself on the basis of its similarity to the anticipatory one. This is the intellectual help which makes it easier for him to overcome the resistances between conscious and unconscious. Incidentally, I may remark that it is not the only mechanism made use of in analytic treatment; you all know the far more powerful one which lies in the use of the 'transference'. It is my intention in the near future to deal with these various factors, which are so important for an understanding of the treatment, in an *Allgemeine Methodik der Psychoanalyse*. And further, in speaking to you I need not rebut the objection that the evidential value in support of the correctness of our hypotheses is obscured in our treatment as we practise it to-day; you will not forget that this evidence is to be found elsewhere, and that a therapeutic procedure cannot be carried out in the same way as a theoretical investigation.

Let me now touch upon one or two fields in which we have new things to learn and do in fact discover new things every day. Above all, there is the field of symbolism in dreams and in the unconscious - a fiercely contested subject, as you know. It is no small merit in our colleague, Wilhelm Stekel, that, untroubled by all the objections raised by our opponents, he has undertaken a study of dream-symbols. There is indeed still much to learn here; my *Interpretation of Dreams*, which was written in 1899, awaits important amplification from researches into symbolism.

I will say a few words about one of the symbols that has newly been recognized. A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual significance of dreams: his own commonest dream was of going upstairs, and surely there could not be anything sexual in *that*. We were put on the alert by this objection, and began to turn our attention to the appearance of steps, staircases and ladders in dreams and were soon in a position to show that staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the basis of the comparison: we come to the top in a series of rhythmical movements and with increasing breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic usage. It shows us that 'mounting' [German '*steigen*'] is used as a direct equivalent for the sexual act. We speak of a man as a '*Steiger*' [a 'mounter'] and of '*nachsteigen*' ['to run after', literally 'to climb after']. In French the steps on a staircase are called '*marches*' and '*un vieux marcheur*' has the same meaning as our '*ein alter Steiger*' ['an old rake']. The dream-material from which these newly recognized symbols are derived will in due time be put before you by the committee we are about to form for a collective study of symbolism. You will find some remarks on another interesting symbol, on 'rescue' and its changes in significance, in the second volume of our *Jahrbuch*. But I must break off here or I shall not get to my other points.

Every one of you will know from his own experience what a very different attitude he has towards a new case of illness when once he has thoroughly grasped the structure of a few typical cases. Imagine that we had arrived at a succinct formula of the factors regularly concerned in constructing the various forms of neuroses, as we have so far succeeded in doing for the construction of hysterical symptoms, and consider how firmly it would establish our prognostic judgement! Just as an obstetrician can tell by examining the placenta whether it has been completely expelled or whether noxious fragments of it still remain, so should we, independently of the outcome and of the patient's condition at the moment, be able to say whether our work had been definitely successful or whether we had to expect relapses and fresh onsets of illness.

(b) I will hasten on to the innovations in the field of technique, where indeed nearly everything still awaits final settlement, and much is only now beginning to become clear. There are now two aims in psycho-analytic technique: to save the physician effort and to give the patient the most unrestricted access to his unconscious. As you know, our technique has undergone a fundamental transformation. At the time of the cathartic treatment what we aimed at was the elucidation of the symptoms; we then turned away from the symptoms and devoted ourselves instead to uncovering the 'complexes', to use a word which Jung has made indispensable; now, however, our work is aimed directly at finding out and overcoming the 'resistances', and we can justifiably rely on the complexes coming to light without difficulty as soon as the resistances have been recognized and removed. Some of you have since felt a need to be able to make a survey of these resistances and classify them. I will ask you to examine your material and see whether you can confirm the generalized statement that in male patients the most important resistances in the treatment seem to be derived from the father-complex and to express themselves in fear of the father, in defiance of the father and in disbelief of the father.

Other innovations in technique relate to the physician himself. We have become aware of the 'counter-transference', which arises in him as a result of the patient's influence on his unconscious feelings, and we are almost inclined to insist that he shall recognize this counter-transference in himself and overcome it. Now that a considerable number of people are practising psycho-analysis and exchanging their observations with one another, we have noticed that no psycho-analyst goes further than his own complexes and internal resistances permit; and we consequently require that he shall begin his activity with a self-analysis and continually carry it deeper while he is making his observations on his patients. Anyone who fails to produce results in a self-analysis of this kind may at once give up any idea of being able to treat patients by analysis.

We are also now coming to the opinion that analytic technique must be modified in certain ways according to the nature of the disease and the dominant instinctual trends in the patient. We started out from the treatment of conversion hysteria; in anxiety hysteria (phobias) we must to some extent alter our procedure. For these patient cannot bring out the material necessary for resolving their phobia so long as they feel protected by obeying the condition which it lays down. One cannot, of course, succeed in getting them to give up their protective measures and work under the influence of anxiety from the beginning of the treatment. One must therefore help them by interpreting their unconscious to them until they can make up their minds to do without the protection of their phobia and expose themselves to a now greatly mitigated anxiety. Only after they have done so does the material become accessible, which, when it has been mastered, leads to a solution of the phobia. Other modifications of technique, which seem to me not yet ripe for discussion, will be required in the treatment of obsessional neurosis. In this connection very important questions arise, which have not hitherto been elucidated: how far the instincts which the patient is combating are to be allowed some satisfaction during the treatment, and what difference it makes whether these impulses are active (sadistic) or passive (masochistic) in their nature.

I hope you will have formed an impression that, when we *know* all that we now only *suspect* and when we have carried out all the improvements in technique to which deeper observation of our patients is bound to lead us, our medical procedure will reach a degree of precision and certainty of success which is not to be found in every specialized field of medicine.

(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it. The impoverishment of the ego due to the large expenditure of energy on repression demanded of every individual by civilization may be one of the principal causes of this state of things.

Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psycho-analysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.

Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psycho-analysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

(3) Finally, I have to explain to you what I mean by the 'general effect' of our work, and how I come to set hopes on it. What we have here is a very remarkable therapeutic constellation, the like of which is perhaps not to be found anywhere else and which will appear strange to you too at first, until you recognize in it something you have long been familiar with. You know, of course, that the psychoneuroses are substitutive satisfactions of some instinct the presence of which one is obliged to deny to oneself and others. Their capacity to exist depends on this distortion and lack of recognition. When the riddle they present is solved and the solution is accepted by the patients these diseases cease to be able to exist. There is hardly anything like this in medicine, though in fairy tales you hear of evil spirits whose power is broken as soon as you can tell them their name - the name which they have kept secret.

In place of a single sick person let us put society - suffering as a whole from neuroses, though composed of sick and healthy members; and in place of individual acceptance in the one case let us put general recognition in the other. A little reflection will then show you that this substitution cannot in any way alter the outcome. The success which the treatment can have with the individual must occur equally with the community. Sick people will not be able to let their various neuroses become known - their anxious over-tenderness which is meant to conceal their hatred, their agoraphobia which tells of disappointed ambition, their obsessive actions which represent self-reproaches for evil intentions and precautions against them - if all their relatives and every stranger from whom they wish to conceal their mental processes know the general meaning of such symptoms, and if they themselves know that in the manifestations of their illness they are producing nothing that other people cannot instantly interpret. The effect, however, will not be limited to the concealment of the symptoms which, incidentally, it is often impossible to carry out; for this necessity for concealment destroys the use of being ill. Disclosure of the secret will have attacked, at its most sensitive point, the 'aetiological equation' from which neuroses arise - it will have made the gain from the illness illusory; and consequently the final outcome of the changed situation brought about by the physician's indiscretion can only be that the production of the illness will be brought to a stop.

If this hope seems Utopian to you, you may remember that neurotic phenomena have actually been dispelled already by this means, although only in quite isolated instances. Think how common hallucinations of the Virgin Mary used to be among peasant girls in former times. So long as such a phenomenon brought a flock of believers and might lead to a chapel being built on the sacred spot, the visionary state of these girls was inaccessible to influence. To-day even our clergy have changed their attitude to such things; they allow police and doctors to examine the visionary, and now the Virgin makes only very rare appearances.

Or let me examine these developments, which I have been describing as taking place in the future, in an analogous situation which is on a smaller scale and consequently easier to take in. Suppose a number of ladies and gentlemen in good society have planned to have a picnic one day at an inn in the country. The ladies have arranged among themselves that if one of them wants to relieve a natural need she will announce that she is going to pick flowers. Some malicious person, however, has got wind of this secret and has had printed on the programme which is sent round to the whole party: 'Ladies who wish to retire are requested to announce that they are going to pick flowers.' After this, of course, no lady will think of availing herself of this flowery pretext, and, in the same way, other similar formulas, which may be freshly agreed upon, will be seriously compromised. What will be the result? The ladies will admit their natural needs without shame and none of the men will object.

Let us return to our more serious case. A certain number of people, faced in their lives by conflicts which they have found too difficult to solve, have taken flight into neurosis and in this way won an unmistakable, although in the long run too costly, gain from illness. What will these people have to do if their flight into illness is barred by the indiscreet revelations of psycho-analysis? They will have to be honest, confess to the instincts that are at work in them, face the conflict, fight for what they want, or go without it; and the tolerance of society, which is bound to ensue as a result of psycho-analytic enlightenment, will help them in their task.

Let us remember, however, that our attitude to life ought not to be that of a fanatic for hygiene or therapy. We must admit that the ideal prevention of neurotic illnesses which we have in mind would not be of advantage to every individual. A good number of those who now take flight into illness would not, under the conditions we have assumed, support the conflict but would rapidly succumb or would cause a mischief greater than their own neurotic illness. Neuroses have in fact their biological function as a protective contrivance and they have their social justification: the 'gain from illness' they provide is not always a purely subjective one. Is there one of you who has not at some time looked into the causation of a neurosis and had to allow that it was the mildest possible outcome of the situation? And should such heavy sacrifices be made in order to eradicate the neuroses in particular, when the world is full of other unavoidable misery?

Are we, then, to abandon our efforts to explain the hidden meaning of neurosis as being in the last resort dangerous to the individual and harmful to the workings of society? Are we to give up drawing the practical conclusion from a piece of scientific insight? No; I think that in spite of this our duty lies in the other direction. The gain from illness provided by the neuroses is nevertheless on the whole and in the end detrimental to individuals as well as to society. The unhappiness that our work of enlightenment may cause will after all only affect some individuals. The change-over to a more realistic and creditable attitude on the part of society will not be bought too dearly by these sacrifices. But above all, all the energies which are today consumed in the production of neurotic symptoms serving the purposes of a world of phantasy isolated from reality, will, even if they cannot at once be put to uses in life, help to strengthen the clamour for the changes in our civilization through which alone we can look for the well-being of future generations.

The Future Prospects Of Psycho-Analytic Therapy

2315

I should therefore like to let you go with an assurance that in treating your patients psycho-analytically you are doing your duty in more senses than one. You are not merely working in the service of science, by making use of the one and only opportunity for discovering the secrets of the neuroses; you are not only giving your patients the most efficacious remedy for their sufferings that is available to-day; you are contributing your share to the enlightenment of the community from which we expect to achieve the most radical prophylaxis against neurotic disorders along the indirect path of social authority.

THE ANTITHETICAL MEANING OF PRIMAL WORDS
(1910)

Intentionally left blank

THE ANTITHETICAL MEANING OF PRIMAL WORDS

In my *Interpretation of Dreams* I made a statement about one of the findings of my analytic work which I did not then understand. I will repeat it here by way of preface to this review:

'The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. "No" seems not to exist so far as dreams are concerned. They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'¹

The dream-interpreters of antiquity seem to have made the most extensive use of the notion that a thing in a dream can mean its opposite. This possibility has also occasionally been recognized by modern students of dreams, in so far as they concede at all that dreams have a meaning and can be interpreted.² Nor do I think that I shall be contradicted if I assume that all who have followed me in interpreting dreams on scientific lines have found confirmation of the statement quoted above.

I did not succeed in understanding the dream-work's singular tendency to disregard negation and to employ the same means of representation for expressing contraries until I happened by chance to read a work by the philologist Karl Abel, which was published in 1884 as a separate pamphlet and included in the following year in the author's *Sprachwissenschaftliche Abhandlungen* [Philological Essays]. The subject is of sufficient interest to justify my quoting here the full text of the crucial passages in Abel's paper (omitting, however, most of the examples). We obtain from them the astonishing information that the behaviour of the dream-work which I have just described is identical with a peculiarity in the oldest languages known to us.

¹ *The Interpretation of Dreams* (1900a), p. 787.

² Cf. G. H. von Schubert (1814, Chapter II).

After stressing the antiquity of the Egyptian language which must have been developed a very long time before the first hieroglyphic inscriptions, Abel goes on (1884, 4):

'Now in the Egyptian language, this sole relic of a primitive world, there are a fair number of words with two meanings, one of which is the exact opposite of the other. Let us suppose, if such an obvious piece of nonsense can be imagined, that in German the word "strong" meant both "strong" and "weak"; that in Berlin the noun "light" was used to mean both "light" and "darkness"; that one Munich citizen called beer "beer", while another used the same word to speak of water: this is what the astonishing practice amounts to which the ancient Egyptians regularly followed in their language. How could anyone be blamed for shaking his head in disbelief? . . . ' (Examples omitted.)

(Ibid., 7): 'In view of these and many similar cases of antithetical meaning (see the Appendix) it is beyond doubt that in one language at least there was a large number of words that denoted at once a thing and its opposite. However astonishing it may be, we are faced with the fact and have to reckon with it.'

The author goes on to reject an explanation of these circumstances which suggests that two words might happen by chance to have the same sound, and is equally firm in repudiating an attempt to refer it to the low stage of mental development in Egypt:

(Ibid., 9): 'But Egypt was anything but a home of nonsense. On the contrary, it was one of the cradles of the development of human reason. . . . It recognized a pure and dignified morality and formulated a great part of the Ten Commandments at a time when the peoples in whose hands civilization rests to-day were in the habit of slaughtering human victims as a sacrifice to bloodthirsty idols. A people that kindled the torch of justice and culture in so dark an age cannot surely have been completely stupid in everyday speech and thought. . . . Men who were able to make glass and raise and move huge blocks by machinery must at least have possessed sufficient sense not to regard a thing as being simultaneously both itself and its opposite. How are we then to reconcile this with the fact that the Egyptians allowed themselves such a strangely contradictory language? . . . that they used to give one and the same phonetic vehicle to the most mutually inimical thoughts, and used to bind together in a kind of indissoluble union things that were in the strongest opposition to each other?'

Before any explanation is attempted, mention must also be made of a further stage in this unintelligible behaviour of the Egyptian language. 'Of all the eccentricities of the Egyptian vocabulary perhaps the most extraordinary feature is that, quite apart from the words that combine antithetical meanings, it possesses other compound words in which two vocables of antithetical meanings are united so as to form a compound which bears the meaning of only one of its two constituents. Thus in this extraordinary language there are not only words meaning equally "strong" or "weak", and "command" or "obey"; but there are also compounds like "old-young", "far-near", "bind-sever", "outside-inside" . . . which, in spite of combining the extremes of difference, mean only "young", "near", "bind" and "inside" respectively . . . So that in these compound words contradictory concepts have been quite intentionally combined, not in order to produce a third concept, as occasionally happens in Chinese, but only in order to use the compound to express the meaning of one of its contradictory parts - a part which would have had the same meaning by itself . . .'

However, the riddle is easier to solve than it appears to be. Our concepts owe their existence to comparisons. 'If it were always light we should not be able to distinguish light from dark, and consequently we should not be able to have either the concept of light or the word for it . . . ' 'It is clear that everything on this planet is relative and has an independent existence only in so far as it is differentiated in respect of its relations to other things . . . ' 'Since every concept is in this way the twin of its contrary, how could it be first thought of and how could it be communicated to other people who were trying to conceive it, other than by being measured against its contrary . . . ' (Ibid., 15): 'Since the concept of strength could not be formed except as a contrary to weakness, the word denoting "strong" contained a simultaneous recollection of "weak", as the thing by means of which it first came into existence. In reality this word denoted neither "strong" nor "weak", but the relation and difference between the two, which created both of them equally . . . ' 'Man was not in fact able to acquire his oldest and simplest concepts except as contraries to their contraries, and only learnt by degrees to separate the two sides of an antithesis and think of one without conscious comparison with the other.'

Since language serves not only to express one's own thoughts but essentially to communicate them to others the question may be raised how it was that the 'primal Egyptian' made his neighbour understand 'which side of the twin concept he meant on any particular occasion'. In the written language this was done with the help of the so-called 'determinative' signs which, placed after the alphabetical ones, assign their meaning to them and are not themselves intended to be spoken. (Ibid., 18): 'If the Egyptian word "*ken*" is to mean "strong", its sound, which is written alphabetically, is followed by the picture of an upright armed man; if the same word has to express "weak", the letters which represent the sound are followed by the picture of a squatting, limp figure. The majority of other words with two meanings are similarly accompanied by explanatory pictures.' Abel thinks that in speech the desired meaning of the spoken word was indicated by gesture.

According to Abel it is in the 'oldest roots' that antithetical double meanings are found to occur. In the subsequent course of the language's development this ambiguity disappeared and, in Ancient Egyptian at any rate, all the intermediate stages can be followed, down to the unambiguousness of modern vocabularies. 'A word that originally bore two meanings separates in the later language into two words with single meanings, in a process whereby each of the two opposed meanings takes over a particular phonetic "reduction" (modification) of the original root.' Thus, for example, in hieroglyphics the word '*ken*', 'strong-weak', already divides into '*ken*', 'strong' and '*kan*', 'weak'. 'In other words, the concepts which could only be arrived at by means of an antithesis became in course of time sufficiently familiar to men's minds to make an independent existence possible for each of their two parts and accordingly to enable a separate phonetic representative to be formed for each part.

Proof of the existence of contradictory primal meanings, which is easily established in Egyptian, extends, according to Abel, to the Semitic and Indo-European languages as well. 'How far this may happen in other language-groups remains to be seen; for although antithesis must have been present originally to the thinking minds of every race, it need not necessarily have become recognizable or have been retained everywhere in the meanings of words.'

Abel further calls attention to the fact that the philosopher Bain, apparently without knowledge that the phenomenon actually existed, claimed this double meaning of words on purely theoretical grounds as a logical necessity. The passage in question¹ begins with these sentences:

'The essential relativity of all knowledge, thought or consciousness cannot but show itself in language. If everything that we can know is viewed as a transition from something else, every experience must have two sides; and either every name must have a double meaning, or else for every meaning there must be two names.'

From the 'Appendix of Examples of Egyptian, Indo-Germanic and Arabic Antithetical Meanings' I select a few instances which may impress even those of us who are not experts in philology. In Latin '*altus*' means 'high' and 'deep', '*sacer*' 'sacred' and 'accursed'; here accordingly we have the complete antithesis in meaning without any modification of the sound of the word. Phonetic alteration to distinguish contraries is illustrated by examples like '*clamare*' ('to cry') - '*clam*' ('softly', 'secretly'); '*siccus*' ('dry') - '*succus*' ('juice'). In German '*Boden*' ['garret' or 'ground'] still means the highest as well as the lowest thing in the house. Our '*bös*' ('bad') is matched by a word '*bass*' ('good'); in Old Saxon '*baſ*' ('good') corresponds to the English 'bad', and the English 'to lock' to the German '*Lücke*', '*Loch*' ['hole']. We can compare the German '*kleben*' ['to stick'] with the English 'to cleave' ('to split'); the German words '*stumm*' ['dumb'] and '*Stimme*' ['voice'], and so on. In this way perhaps even the much derided derivation *lucus a non lucendo*² would have some sense in it.

¹ Bain (1870, 1, 54).

² ['*Lucus*' (Latin for 'a grove') is said to be derived from '*lucere*' ('to shine') because it does not shine there. (Attributed to Quintilian.)]

In his essay on 'The Origin of Language' Abel (1885, 305) calls attention to further traces of ancient difficulties in thinking. Even to-day the Englishman in order to express 'ohne' says 'without' ('*mitohne*' ['with-without'] in German), and the East Prussian does the same. The word 'with' itself, which to-day corresponds to the German '*mit*', originally meant 'without' as well as 'with', as can be recognized from 'withdraw and 'withhold'. The same transformation can be seen in the German '*wider*' ('against') and '*wieder*' ('together with').

For comparison with the dream-work there is another extremely strange characteristic of the ancient Egyptian language which is significant. 'In Egyptian, words can - apparently, we will say to begin with - *reverse their sound as well as their sense*. Let us suppose that the German word "*gut*" ["good"] was Egyptian: it could then mean "bad" as well as "good", and be pronounced "tug" as well as "gut". Numerous examples of such reversals of sound, which are too frequent to be explained as chance occurrences, can be produced from the Aryan and Semitic languages as well. Confining ourselves in the first instance to Germanic languages we may note: *Topf* [pot] - pot; boat - tub; wait - *täuwen* [tarry]; hurry - *Ruhe* [rest]; care - reck; *Balken* [beam] - *Klobe* [log], club. If we take the other Indo-Germanic languages into consideration, the number of relevant instances grows accordingly; for example, *capere* [Latin for "take"] - *packen* [German for "seize"]; *ren* [Latin for "kidney"] - *Niere* [German for "kidney"]; leaf - *folium* [Latin for "leaf"]; *dum-a* [Russian for "thought"], *θυμός* [Greek for "spirit", "courage"] - *mêdh*, *mûdha* [Sanskrit for "mind"], *Mut* [German for "courage"]; *rauchen* [German for "to smoke"] - *Kur-ît* [Russian for "to smoke"]; *kreischen* [German for "to shriek"] - to shriek, etc.'

Abel tries to explain the phenomenon of reversal of sound as a doubling or reduplication of the root. Here we should find some difficulty in following the philologist. We remember in this connection how fond children are of playing at reversing the sound of words and how frequently the dream-work makes use of a reversal of the representational material for various purposes. (Here it is no longer letters but images whose order is reversed.) We should therefore be more inclined to derive reversal of sound from a factor of deeper origin.¹

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.²

¹ For the phenomenon of reversal of sound (metathesis), which it perhaps even more intimately related to the dream-work than are contradictory meanings (antithesis), compare also Meyer-Rinteln (1909).

² It is plausible to suppose, too, that the original antithetical meaning of words exhibits the ready-made mechanism which is exploited for various purposes by slips of the tongue that result in the opposite being said.

A SPECIAL TYPE OF CHOICE OF OBJECT MADE BY MEN
(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE I)
(1910)

Intentionally left blank

A SPECIAL TYPE OF CHOICE OF OBJECT MADE BY MEN (CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE I)

Up till now we have left it to the creative writer to depict for us the 'necessary conditions for loving' which govern people's choice of an object, and the way in which they bring the demands of their imagination into harmony with reality. The writer can indeed draw on certain qualities which fit him to carry out such a task: above all, on a sensitivity that enables him to perceive the hidden impulses in the minds of other people, and the courage to let his own unconscious speak. But there is one circumstance which lessens the evidential value of what he has to say. Writers are under the necessity to produce intellectual and aesthetic pleasure, as well as certain emotional effects. For this reason they cannot reproduce the stuff of reality unchanged, but must isolate portions of it, remove disturbing associations, tone down the whole and fill in what is missing. These are the privileges of what is known as 'poetic licence'. Moreover they can show only slight interest in the origin and development of the mental states which they portray in their completed form. In consequence it becomes inevitable that science should concern herself with the same materials whose treatment by artists has given enjoyment to mankind for thousands of years, though her touch must be clumsier and the yield of pleasure less. These observations will, it may be hoped, serve to justify us in extending a strictly scientific treatment to the field of human love. Science is, after all, the most complete renunciation of the pleasure principle of which our mental activity is capable.

In the course of psycho-analytic treatment there are ample opportunities for collecting impressions of the way in which neurotics behave in love; while at the same time we can recall having observed or heard of similar behaviour in people of average health or even in those with outstanding qualities. When the material happens to be favourable and thus leads to an accumulation of such impressions, distinct types emerge more clearly. I will begin here with a description of one such type of object-choice - which occurs in men - since it is characterized by a number of 'necessary conditions for loving' whose combination is unintelligible, and indeed bewildering, and since it admits of a simple explanation on psycho-analytic lines.

(1) The first of these preconditions for loving can be described as positively specific: wherever it is found, the presence of the other characteristics of this type may be looked for. It may be termed the precondition that there should be 'an injured third party'; it stipulates that the person in question shall never choose as his love-object a woman who is disengaged - that is, an unmarried girl or an unattached married woman - but only one to whom another man can claim right of possession as her husband, fiancé or friend. In some cases this precondition proves so cogent that a woman can be ignored, or even rejected, so long as she does not belong to any man, but becomes the object of passionate feelings immediately she comes into one of these relationships with another man.

(2) The second precondition is perhaps a less constant one, but it is no less striking. It has to be found in conjunction with the first for the type to be realized, whereas the first precondition seems very often to occur independently as well. This second precondition is to the effect that a woman who is chaste and whose reputation is irreproachable never exercises an attraction that might raise her to the status of a love-object, but only a woman who is in some way or other of bad repute sexually, whose fidelity and reliability are open to some doubt. This latter characteristic may vary within substantial limits, from the faint breath of scandal attaching to a married woman who is not averse to a flirtation up to the openly promiscuous way of life of a *cocotte* or of an adept in the art of love; but the men who belong to our type will not be satisfied without something of the kind. This second necessary condition may be termed, rather crudely, 'love for a prostitute'.

While the first precondition provides an opportunity for gratifying impulses of rivalry and hostility directed at the man from whom the loved woman is wrested, the second one, that of the woman's being like a prostitute, is connected with the experiencing of *jealousy* which appears to be a necessity for lovers of this type. It is only when they are able to be jealous that their passion reaches its height and the woman acquires her full value, and they never fail to seize on an occasion that allows them to experience these most powerful emotions. What is strange is that it is not the lawful possessor of the loved one who becomes the target of this jealousy, but strangers, making their appearance for the first time, in relation to whom the loved one can be brought under suspicion. In glaring instances the lover shows no wish for exclusive possession of the woman and seems to be perfectly comfortable in the triangular situation. One of my patients, who had been made to suffer terribly by his lady's escapades, had no objection to her getting married, and did all he could to bring it about; in the years that followed he never showed a trace of jealousy towards her husband. Another typical patient had, it is true, been very jealous of the husband in his first love affair, and had forced the lady to stop having marital relations; but in his numerous subsequent affairs he behaved like the other members of this type and no longer regarded the lawful husband as an interference.

So much for the conditions required in the love-object. The following points describe the lover's behaviour towards the object he has chosen.

(3) In normal love the woman's value is measured by her sexual integrity, and is reduced by any approach to the characteristic of being like a prostitute [German *Dirne*]. Hence the fact that women with this characteristic are considered by men of our type to be *love-objects of the highest value* seems to be a striking departure from the normal. Their love-relationships with these women are carried on with the highest expenditure of mental energy, to the exclusion of all other interests; they are felt as the only people whom it is possible to love, and the demand for fidelity which the lover makes upon himself is repeated again and again, however often it may be broken in reality. These features of the love-relationships which I am here describing show their *compulsive* nature very clearly, though that is something which is found up to a certain degree whenever anyone falls in love. But the fidelity and intensity that mark the attachment must not lead one to expect that a single love-relationship of this kind will make up the whole erotic life of the person in question or occur only once in it. On the contrary, passionate attachments of this sort are repeated with the same peculiarities - each an exact replica of the others - again and again in the lives of men of this type; in fact, owing to external events such as changes of residence and environment, the love-objects may replace one another so frequently that a *long series of them is formed*.

(4) What is most startling of all to the observer in lovers of this type is the urge they show to 'rescue' the woman they love. The man is convinced that she is in need of him, that without him she would lose all moral control and rapidly sink to a lamentable level. He rescues her, therefore, by not giving her up. In some individual cases the idea of having to rescue her can be justified by reference to her sexual unreliability and the dangers of her social position: but it is no less conspicuous where there is no such basis in reality. One man of the type I am describing, who knew how to win his ladies by clever methods of seduction and subtle arguments, spared no efforts in the subsequent course of these affairs to keep the woman he was for the time being in love with on the path of 'virtue' by presenting her with tracts of his own composition.

If we survey the different features of the picture presented here - the conditions imposed on the man that his loved one should not be unattached and should be like a prostitute, the high value he sets on her, his need for feeling jealousy, his fidelity, which is nevertheless compatible with being broken down into a long series of instances, and the urge to rescue the woman - it will seem scarcely probable that they should all be derived from a single source. Yet psycho-analytic exploration into the life-histories of men of this type has no difficulty in showing that there is such a single source. The object-choice which is so strangely conditioned, and this very singular way of behaving in love, have the same psychical origin as we find in the loves of normal people. They are derived from the infantile fixation of tender feelings on the mother, and represent one of the consequences of that fixation. In normal love only a few characteristics survive which reveal unmistakably the maternal prototype of the object-choice, as, for instance, the preference shown by young men for maturer women; the detachment of libido from the mother has been effected relatively swiftly. In our type, on the other hand, the libido has remained attached to the mother for so long, even after the onset of puberty, that the maternal characteristics remain stamped on the love-objects that are chosen later, and all these turn into easily recognizable mother-surrogates. The comparison with the way in which the skull of a newly born child is shaped springs to mind at this point: after a protracted labour it always takes the form of a cast of the narrow part of the mother's pelvis.

We have now to show the plausibility of our assertion that the characteristic features of our type - its conditions for loving and its behaviour in love - do in fact arise from the psychical constellation connected with the mother. This would seem to be easiest where the first precondition is concerned - the condition that the woman should not be unattached, or that there should be an injured third party. It is at once clear that for the child who is growing up in the family circle the fact of the mother belonging to the father becomes an inseparable part of the mother's essence, and that the injured third party is none other than the father himself. The trait of overvaluing the loved one, and regarding her as unique and irreplaceable, can be seen to fall just as naturally into the context of the child's experience, for no one possesses more than one mother, and the relation to her is based on an event that is not open to any doubt and cannot be repeated.

If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psycho-analysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

On the other hand the second precondition for loving - the condition that the object chosen should be like a prostitute - seems energetically to oppose a derivation from the mother complex. The adult's conscious thought likes to regard his mother as a person of unimpeachable moral purity; and there are few ideas which he finds so offensive when they come from others, or feels as so tormenting when they spring from his own mind, as one which calls this aspect of his mother in question. This very relation of the sharpest contrast between 'mother' and 'prostitute' will however encourage us to enquire into the history of the development of these two complexes and the unconscious relation between them, since we long ago discovered that what, in the conscious, is found split into a pair of opposites often occurs in the unconscious as a unity. Investigation then leads us back to the time in a boy's life at which he first gains a more or less complete knowledge of the sexual relations between adults, somewhere about the years of pre-puberty. Brutal pieces of information, which are undisguisedly intended to arouse contempt and rebelliousness, now acquaint him with the secret of sexual life and destroy the authority of adults, which appears incompatible with the revelation of their sexual activities. The aspect of these disclosures which affects the newly initiated child most strongly is the way in which they apply to his own parents. This application is often flatly rejected by him, in some such words as these: '*Your* parents and other people may do something like that with one another, but *my* parents can't possibly do it.

As an almost invariable corollary to this sexual enlightenment, the boy at the same time gains a knowledge of the existence of certain women who practise sexual intercourse as a means of livelihood, and who are for this reason held in general contempt. The boy himself is necessarily far from feeling this contempt: as soon as he learns that he too can be initiated by these unfortunates into sexual life, which till then he accepted as being reserved exclusively for 'grown-ups', he regards them only with a mixture of longing and horror. When after this he can no longer maintain the doubt which makes his parents an exception to the universal and odious norms of sexual activity, he tells himself with cynical logic that the difference between his mother and a whore is not after all so very great, since basically they do the same thing. The enlightening information he has received has in fact awakened the memory-traces of the impressions and wishes of his early infancy, and these have led to a reactivation in him of certain mental impulses. He begins to desire his mother herself in the sense with which he has recently become acquainted, and to hate his father anew as a rival who stands in the way of this wish; he comes, as we say, under the dominance of the Oedipus complex. He does not forgive his mother for having granted the favour of sexual intercourse not to himself but to his father, and he regards it as an act of unfaithfulness. If these impulses do not quickly pass, there is no outlet for them other than to run their course in phantasies which have as their subject his mother's sexual activities under the most diverse circumstances; and the consequent tension leads particularly readily to his finding relief in masturbation. As a result of the constant combined operation of the two driving forces, desire and thirst for revenge, phantasies of his mother's unfaithfulness are by far the most preferred; the lover with whom she commits her act of infidelity almost always exhibits the features of the boy's own ego, or more accurately, of his own idealized personality, grown up and so raised to a level with his father. What I have elsewhere¹ described as the 'family romance' comprises the manifold ramifications of this imaginative activity and the way in which they are interwoven with various egoistic interests of this period of life.

¹ In Rank's *The Myth of the Birth of the Hero* (1909).

Now that we have gained an insight into this piece of mental development we can no longer regard it as contradictory and incomprehensible that the precondition of the loved one's being like a prostitute should derive directly from the mother complex. The type of male love which we have described bears the traces of this evolution and is simple to understand as a fixation on the phantasies formed by the boy in puberty - phantasies which have later after all found a way out into real life. There is no difficulty in assuming that the masturbation assiduously practised in the years of puberty has played its part in the fixation of the phantasies.

To these phantasies which have succeeded in dominating the man's love in real life, the urge to *rescue* the loved one seems to bear merely a loose and superficial relation, and one that is fully accounted for by conscious reasons. By her propensity to be fickle and unfaithful the loved one brings herself into dangerous situations, and thus it is understandable that the lover should be at pains to protect her from these dangers by watching over her virtue and counteracting her bad inclinations. However, the study of people's screen-memories, phantasies and nocturnal dreams shows that we have here a particularly felicitous 'rationalization' of an unconscious motive, a process which may be compared to a successful secondary revision of a dream. In actual fact the '*rescue-motif*' has a meaning and history of its own, and is an independent derivative of the mother-complex, or more accurately, of the parental complex. When a child hears that he *owes his life* to his parents, or that his mother *gave him life*, his feelings of tenderness unite with impulses which strive at power and independence, and they generate the wish to return this gift to the parents and to repay them with one of equal value. It is as though the boy's defiance were to make him say: 'I want nothing from my father; I will give him back all I have cost him.' He then forms the phantasy of *rescuing his father from danger and saving his life*; in this way he puts his account square with him. This phantasy is commonly enough displaced on to the emperor, king or some other great man; after being thus distorted it becomes admissible to consciousness, and may even be made use of by creative writers. In its application to a boy's father it is the defiant meaning in the idea of rescuing which is by far the most important; where his mother is concerned it is usually its tender meaning. The mother gave the child life, and it is not easy to find a substitute, of equal value for this unique gift. With a slight change of meaning, such as is easily effected in the unconscious and is comparable to the way in which in consciousness concepts shade into one another, rescuing his mother takes on the significance of giving her a child or making a child for her - needless to say, one like himself. This is not too remote from the original sense of rescuing, and the change in meaning is not an arbitrary one. His mother gave him a life - his own life - and in exchange he gives her another life, that of a child which has the greatest resemblance to himself. The son shows his gratitude by wishing to have by his mother a son who is like himself: in other words, in the rescue-phantasy he is completely identifying himself with his father. All his instincts, those of tenderness, gratitude, lustfulness, defiance and independence, find satisfaction in the single wish *to be his own father*. Even the element of danger has not been lost in the change of meaning; for the act of birth itself is the danger from which he was saved by his mother's efforts. Birth is both the first of all dangers to life and the prototype of all the later ones that cause us to feel anxiety, and the experience of birth has probably left behind in us the expression of affect which we call anxiety. Macduff of the Scottish legend, who was not born of his mother but ripped from her womb, was for that reason unacquainted with anxiety.

Artemidorus, the dream-interpreter of antiquity, was certainly right in maintaining that the meaning of a dream depends on who the dreamer happens to be. Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharoah's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue-phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son - that is, to have a son who is like his father.

It is on account of all these connections between the rescue-*motif* and the parental complex that the urge to rescue the loved one forms an important feature of the type of loving which I have been discussing.

I do not feel that it is necessary for me to justify my method of work on this subject; as in my presentation of anal erotism, so here too I have in the first place aimed at singling out from the observational material extreme and sharply defined types. In both cases we find a far greater number of individuals in whom only a few features of the type can be recognized, or only features which are not distinctly marked, and it is obvious that a proper appreciation of these types will not be possible until the whole context to which they belong has been explored.

ON THE UNIVERSAL TENDENCY TO DEBASEMENT IN THE SPHERE OF LOVE (CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE II)

I

If the practising psycho-analyst asks himself on account of what disorder people most often come to him for help, he is bound to reply - disregarding the many forms of anxiety - that it is psychical impotence. This singular disturbance affects men of strongly libidinous natures, and manifests itself in a refusal by the executive organs of sexuality to carry out the sexual act, although before and after they may show themselves to be intact and capable of performing the act, and although a strong psychical inclination to carry it out is present. The first clue to understanding his condition is obtained by the sufferer himself on making the discovery that a failure of this kind only arises when the attempt is made with certain individuals; whereas with others there is never any question of such a failure. He now becomes aware that it is some feature of the sexual object which gives rise to the inhibition of his male potency, and sometimes he reports that he has a feeling of an obstacle inside him, the sensation of a counter-will which successfully interferes with his conscious intention. However, he is unable to guess what this internal obstacle is and what feature of the sexual object brings it into operation. If he has had repeated experience of a failure of this kind, he is likely, by the familiar process of 'erroneous connection', to decide that the recollection of the first occasion evoked the disturbing anxiety-idea and so caused the failure to be repeated each time; while he derives the first occasion itself from some 'accidental' impression.

Psycho-analytic studies of psychical impotence have already been carried out and published by several writers.¹ Every analyst can confirm the explanations provided by them from his own clinical experience. It is in fact a question of the inhibitory influence of certain psychical complexes which are withdrawn from the subject's knowledge. An incestuous fixation on mother or sister, which has never been surmounted, plays a prominent part in this pathogenic material and is its most universal content. In addition there is the influence to be considered of accidental distressing impressions connected with infantile sexual activity, and also those factors which in a general way reduce the libido that is to be directed on to the female sexual object.²

When striking cases of psychical impotence are exhaustively investigated by means of psycho-analysis, the following information is obtained about the psychosexual processes at work in them. Here again - as very probably in all neurotic disturbances - the foundation of the disorder is provided by an inhibition in the developmental history of the libido before it assumes the form which we take to be its normal termination. Two currents whose union is necessary to ensure a completely normal attitude in love have, in the cases we are considering, failed to combine. These two may be distinguished as the *affectionate* and the *sensual* current.

The affectionate current is the older of the two. It springs from the earliest years of childhood; it is formed on the basis of the interests of the self-preservative instinct and is directed to the members of the family and those who look after the child. From the very beginning it carries along with it contributions from the sexual instincts - components of erotic interest - which can already be seen more or less clearly even in childhood and in any event are uncovered in neurotics by psycho-analysis later on. It corresponds to *the child's primary object-choice*. We learn in this way that the sexual instincts find their first objects by attaching themselves to the valuations made by the ego-instincts, precisely in the way in which the first sexual satisfactions are experienced in attachment to the bodily functions necessary for the preservation of life. The 'affection' shown by the child's parents and those who look after him, which seldom fails to betray its erotic nature ('the child is an erotic plaything'), does a very great deal to raise the contributions made by erotism to the cathexes of his ego-instincts, and to increase them to an amount which is bound to play a part in his later development, especially when certain other circumstances lend their support.

¹ Steiner (1907), Stekel (1908), Ferenczi (1908).

² Stekel (1908, 191 ff.).

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathect the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago) of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother - according to the biblical command - and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object - this being the normal overvaluation of the sexual object on the part of a man.

Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of *frustration in reality*, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of *attraction* which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.

Less severe conditions are required to bring about the state known specifically as psychical impotence. Here the fate of the sensual current must not be that its whole charge has to conceal itself behind the affectionate current; it must have remained sufficiently strong or uninhibited to secure a partial outlet into reality. The sexual activity of such people shows the clearest signs, however, that it has not the whole psychical driving force of the instinct behind it. It is capricious, easily disturbed, often not properly carried out, and not accompanied by much pleasure. But above all it is forced to avoid the affectionate current. A restriction has thus been placed on object-choice. The sensual current that has remained active seeks only objects which do not recall the incestuous figures forbidden to it; if someone makes an impression that might lead to a high psychical estimation of her, this impression does not find an issue in any sensual excitation but in affection which has no erotic effect. The whole sphere of love in such people remains divided in the two directions personified in art as sacred and profane (or animal) love. Where they love they do not desire and where they desire they cannot love. They seek objects which they do not need to love, in order to keep their sensuality away from the objects they love; and, in accordance with the laws of 'complexive sensitiveness' and of the return of the repressed, the strange failure shown in psychical impotence makes its appearance whenever an object which has been chosen with the aim of avoiding incest recalls the prohibited object through some feature, often an inconspicuous one.

The main protective measure against such a disturbance which men have recourse to in this split in their love consists in a psychical *debasement* of the sexual object, the overvaluation that normally attaches to the sexual object being reserved for the incestuous object and its representatives. As soon as the condition of debasement is fulfilled, sensuality can be freely expressed, and important sexual capacities and a high degree of pleasure can develop. There is a further factor which contributes to this result. People in whom there has not been a proper confluence of the affectionate and the sensual currents do not usually show much refinement in their modes of behaviour in love; they have retained perverse sexual aims whose non-fulfilment is felt as a serious loss of pleasure, and whose fulfilment on the other hand seems possible only with a debased and despised sexual object.

We can now understand the motives behind the boy's phantasies mentioned in the first of these 'Contributions' (above, [p. 2331](#)), which degrade the mother to the level of a prostitute. They are efforts to bridge the gulf between the two currents in love, at any rate in phantasy, and by debasing the mother to acquire her as an object of sensuality.

2

In the preceding section we have approached the study of psychical impotence from a medico-psychological angle of which the title of this paper gives no indication. It will however become clear that this introduction was required by us to provide an approach to our proper subject.

We have reduced psychical impotence to the failure of the affectionate and the sensual currents in love to combine, and this developmental inhibition has in turn been explained as being due to the influences of strong childhood fixations and of later frustration in reality through the intervention of the barrier against incest. There is one principal objection to the theory we advance; it does too much. It explains why certain people suffer from psychical impotence, but it leaves us with the apparent mystery of how others have been able to escape this disorder. Since we must recognize that all the relevant factors known to us - the strong childhood fixation, the incest-barrier and the frustration in the years of development after puberty - are to be found in practically all civilized human beings, we should be justified in expecting psychical impotence to be a universal affliction under civilization and not a disorder confined to some individuals.

It would be easy to escape from this conclusion by pointing to the quantitative factor in the causation of illness - to the greater or lesser extent of the contribution made by the various elements which determine whether a recognizable illness results or not. But although I accept this answer as correct, it is not my intention to make it a reason for rejecting the conclusion itself. On the contrary, I shall put forward the view that psychical impotence is much more widespread than is supposed, and that a certain amount of this behaviour does in fact characterize the love of civilized man.

If the concept of psychical impotence is broadened and is not restricted to failure to perform the act of coitus in circumstances where a desire to obtain pleasure is present and the genital apparatus is intact, we may in the first place add all those men who are described as psychanaesthetic: men who never fail in the act but who carry it out without getting any particular pleasure from it - a state of affairs that is more common than one would think. Psycho-analytic examination of such cases discloses the same aetiological factors as we found in psychical impotence in the narrower sense, without at first arriving at any explanation of the difference between their symptoms. An easily justifiable analogy takes one from these anaesthetic men to the immense number of frigid women; and there is no better way to describe or understand their behaviour in love than by comparing it with the more conspicuous disorder of psychical impotence in men.¹

¹ I am at the same time very willing to admit that frigidity in women is a complex subject which can also be approached from another angle.

If however we turn our attention not to an extension of the concept of psychological impotence, but to the gradations in its symptomatology, we cannot escape the conclusion that the behaviour in love of men in the civilized world to-day bears the stamp altogether of psychological impotence. There are only a very few educated people in whom the two currents of affection and sensuality have become properly fused; the man almost always feels his respect for the woman acting as a restriction on his sexual activity, and only develops full potency when he is with a debased sexual object; and this in its turn is partly caused by the entrance of perverse components into his sexual aims, which he does not venture to satisfy with a woman he respects. He is assured of complete sexual pleasure only when he can devote himself unreservedly to obtaining satisfaction, which with his well-brought-up wife, for instance, he does not dare to do. This is the source of his need for a debased sexual object, a woman who is ethically inferior, to whom he need attribute no aesthetic scruples, who does not know him in his other social relations and cannot judge him in them. It is to such a woman that he prefers to devote his sexual potency, even when the whole of his affection belongs to a woman of a higher kind. It is possible, too, that the tendency so often observed in men of the highest classes of society to choose a woman of a lower class as a permanent mistress or even as a wife is nothing but a consequence of their need for a debased sexual object, to whom, psychologically, the possibility of complete satisfaction is linked.

I do not hesitate to make the two factors at work in psychical impotence in the strict sense - the factors of intense incestuous fixation in childhood and the frustration by reality in adolescence - responsible, too, for this extremely common characteristic of the love of civilized men. It sounds not only disagreeable but also paradoxical, yet it must nevertheless be said that anyone who is to be really free and happy in love must have surmounted his respect for women and have come to terms with the idea of incest with his mother or sister. Anyone who subjects himself to a serious self-examination on the subject of this requirement will be sure to find that he regards the sexual act basically as something degrading, which defiles and pollutes not only the body. The origin of this low opinion, which he will certainly not willingly acknowledge, must be looked for in the period of his youth in which the sensual current in him was already strongly developed but its satisfaction with an object outside the family was almost as completely prohibited as it was with an incestuous one.

In our civilized world women are under the influence of a similar after-effect of their upbringing, and, in addition, of their reaction to men's behaviour. It is naturally just as unfavourable for a woman if a man approaches her without his full potency as it is if his initial overvaluation of her when he is in love gives place to undervaluation after he has possessed her. In the case of women there is little sign of a need to debase their sexual object. This is no doubt connected with the absence in them as a rule of anything similar to the sexual overvaluation found in men. But their long holding back from sexuality and the lingering of their sensuality in phantasy has another important consequence for them. They are subsequently often unable to undo the connection between sensual activity and the prohibition, and prove to be psychically impotent, that is, frigid, when such activity is at last allowed them. This is the origin of the endeavour made by many women to keep even legitimate relations secret for a while; and of the capacity of other women for normal sensation as soon as the condition of prohibition is re-established by a secret love affair: unfaithful to their husband, they are able to keep a second order of faith with their lover.

The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

In view of the strenuous efforts being made in the civilized world to-day to reform sexual life, it will not be superfluous to give a reminder that psycho-analytic research is as remote from tendentiousness as any other kind of research. It has no other end in view than to throw light on things by tracing what is manifest back to what is hidden. It is quite satisfied if reforms make use of its findings to replace what is injurious by something more advantageous; but it cannot predict whether other institutions may not result in other, and perhaps graver, sacrifices.

3

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

One's first inclination is no doubt to trace back the difficulties revealed here to universal characteristics of our organic instincts. It is no doubt also true in general that the psychical importance of an instinct rises in proportion to its frustration. Suppose a number of totally different human beings were all equally exposed to hunger. As their imperative need for food mounted, all the individual differences would disappear and in their place one would see the uniform manifestations of the one unappeased instinct. But is it also true that with the satisfaction of an instinct its psychical value always falls just as sharply? Consider, for example, the relation of a drinker to wine. Is it not true that wine always provides the drinker with the same toxic satisfaction, which in poetry has so often been compared to erotic satisfaction - a comparison acceptable from the scientific point of view as well? Has one ever heard of the drinker being obliged constantly to change his drink because he soon grows tired of keeping to the same one? On the contrary, habit constantly tightens the bond between a man and the kind of wine he drinks. Does one ever hear of a drinker who needs to go to a country where wine is dearer or drinking is prohibited, so that by introducing obstacles he can reinforce the dwindling satisfaction that he obtains? Not at all. If we listen to what our great alcoholics, such as Böcklin,¹ say about their relation to wine, it sounds like the most perfect harmony, a model of a happy marriage. Why is the relation of the lover to his sexual object so very different?

It is my belief that, however strange it may sound, we must reckon with the possibility that something in the nature of the sexual instinct itself is unfavourable to the realization of complete satisfaction. If we consider the long and difficult developmental history of the instinct, two factors immediately spring to mind which might be made responsible for this difficulty. Firstly, as a result of the diphasic onset of object-choice, and the interposition of the barrier against incest, the final object of the sexual instinct is never any longer the original object but only a surrogate for it. Psycho-analysis has shown us that when the original object of a wishful impulse has been lost as a result of repression, it is frequently represented by an endless series of substitutive objects none of which, however, brings full satisfaction. This may explain the inconstancy in object-choice, the 'craving for stimulation' which is so often a feature of the love of adults.

¹ Floerke (1902, 16).

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter unrinās et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing to-day.

It is not the aim of science either to frighten or to console. But I myself am quite ready to admit that such far-reaching conclusions as those I have drawn should be built on a broader foundation, and that perhaps developments in other directions may enable mankind to correct the results of the developments I have here been considering in isolation.

THE TABOO OF VIRGINITY
(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE III)
(1918)

Intentionally left blank

THE TABOO OF VIRGINITY

(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE III)

Few details of the sexual life of primitive peoples are so alien to our own feelings as their estimate of virginity, the state in a woman of being untouched. The high value which her suitor places on a woman's virginity seems to us so firmly rooted, so much a matter of course, that we find ourselves almost at a loss if we have to give reasons for this opinion. The demand that a girl shall not bring to her marriage with a particular man any memory of sexual relations with another is, indeed, nothing other than a logical continuation of the right to exclusive possession of a woman, which forms the essence of monogamy, the extension of this monopoly to cover the past.

From this point we have no trouble in justifying what looked at first like a prejudice, by referring to our views on the erotic life of women. Whoever is the first to satisfy a virgin's desire for love, long and laboriously held in check, and who in doing so overcomes the resistances which have been built up in her through the influences of her milieu and education, that is the man she will take into a lasting relationship, the possibility of which will never again be open to any other man. This experience creates a state of bondage in the woman which guarantees that possession of her shall continue undisturbed and makes her able to resist new impressions and enticements from outside.

The expression 'sexual bondage' was chosen by von Krafft Ebing (1892) to describe the phenomenon of a person's acquiring an unusually high degree of dependence and lack of self-reliance in relation to another person with whom he has a sexual relationship. This bondage can on occasion extend very far, as far as the loss of all independence will and as far as causing a person to suffer the greatest sacrifices of his own interests; the author, however, does not fail to remark that a certain measure of such dependence 'is absolutely necessary, if the tie is to last for any length of time'. Some such measure of sexual bondage is, indeed, indispensable to the maintenance of civilized marriage and to holding at bay the polygamous tendencies which threaten it, and in our social communities this factor is regularly reckoned upon.

Von Krafft-Ebing derives the formation of sexual bondage from a conjunction of an 'uncommon degree of the state of being in love and of weakness of character' in one person and unbounded egoism in the other. Analytic experience, however, will not let us rest satisfied with this simple attempt at explanation. We can see, rather, that the decisive factor is the amount of sexual resistance that is overcome and in addition the fact that the process of overcoming the resistance is concentrated and happens only once. This state of bondage is, accordingly, far more frequent and more intense in women than in men, though it is true it occurs in the latter more often nowadays than it did in ancient times. Wherever we have been able to study sexual bondage in men it has shown itself as resulting from an overcoming of psychical impotence through one particular woman, to whom the man in question has remained subsequently bound. Many strange marriages and not a few tragic events - even some with far-reaching consequences - seem to owe their explanation to this origin.

Turning to the attitude of primitive peoples, it is incorrect to describe it by declaring that they set no value on virginity and to submit as proof of this the fact that they perform the defloration of girls outside marriage and before the first act of marital intercourse. On the contrary, it appears that for them, too, defloration is a significant act; but it has become the subject of a taboo - of a prohibition which may be described as religious. Instead of reserving it for the girl's bridegroom and future partner in marriage, custom demands that *he shall shun the performance of it*.¹

It is no part of my purpose to make a full collection of the literary evidence for the existence of this custom of prohibition, to pursue its geographical distribution and to enumerate all the forms in which it is expressed. I shall content myself, therefore, with stating the fact that the practice of rupturing the hymen in this way outside the subsequent marriage is very widespread among primitive races living to-day. As Crawley says 'This marriage ceremony consists in perforation of the hymen by some appointed person other than the husband; it is most common in the lowest stages of culture, especially in Australia.' (Crawley, 1902, 347.)

¹ Cf. Crawley (1902), Ploss and Bartels (1891), Frazer (1911) and Havelock Ellis.

If, however, defloration is not to result from the first act of marital intercourse, then it must have been carried out beforehand - whatever the way and whoever the agent may have been. I shall quote a few passages from Crawley's book, mentioned above, which provide information on these points but also give grounds for some critical observations.

(Ibid., 191.) 'Thus in the Dieri and neighbouring tribes (in Australia) it is the universal custom when a girl reaches puberty to rupture the hymen (*Journal of the Royal Anthropological Institute*, **24**, 169). In the Portland and Glenelg tribes this is done to the bride by an old woman; and sometimes white men are asked for this reason to deflower maidens (Brough Smith, **2**, 319).'

(Ibid., 307.) 'The artificial rupture of the hymen sometimes takes place in infancy, but generally at puberty. . . . It is often combined, as in Australia, with a ceremonial act of intercourse.'

(Ibid., 348.) (Of Australian tribes among which the well known exogamous marriage-restrictions are in force, from communications by Spencer and Gillen:) 'The hymen is artificially perforated, and then the assisting men have access (ceremonial, be it observed) to the girl in a stated order. . . . The act is in two parts, perforation and intercourse.'

(Ibid., 349.) 'An important preliminary of marriage amongst the Masai (in Equatorial Africa) is the performance of this operation on the girl (J. Thomson, **2**, 258). This defloration is performed by the father of the bride amongst the Sakais (Malay), Battas (Sumatra), and Alfoers of Celebes (Ploss and Bartels, **2**, 490). In the Philippines there were certain men whose profession it was to deflower brides, in case the hymen had not been ruptured in childhood by an old woman who was sometimes employed for this (Featherman, **2**, 474). The defloration of the bride was amongst some Eskimo tribes entrusted to the *angedkok*, or priest (ibid., **3**, 406).'

The critical remarks I referred to are concerned with two points. Firstly, it is a pity that in these reports a more careful distinction is not made between simple rupture of the hymen without intercourse, and intercourse for the purpose of effecting this rupture. There is only one passage in which we are told expressly that the procedure falls into two actions: defloration (carried out by hand or with some instrument) and the act of intercourse which follows it. The material in Ploss and Bartels (1891), in other respects so rich, is almost useless for our purpose, because in their presentation of it the psychological importance of the act of defloration is completely displaced in favour of its anatomical results. Secondly, we should be glad to be informed how the 'ceremonial' (purely formal, ritual, or official) coitus, which takes place on these occasions, differs from ordinary sexual intercourse. The authors to whom I have had access either have been too embarrassed to discuss the matter or have once again underestimated the psychological importance of such sexual details. It is to be hoped that the first-hand accounts of travellers and missionaries may be more complete and less ambiguous, but since this literature, which is for the most part foreign, is for the time being inaccessible I cannot say anything definite on the subject. Besides, we may get round the problem arising over this second point if we bear in mind the fact that a ceremonial mock-coitus would after all only represent a substitute for, and perhaps replace altogether, an act that in earlier times would have been carried out completely.¹

There are various factors which can be adduced to explain this taboo of virginity and which I will enumerate and consider briefly. When a virgin is deflowered, her blood is as a rule shed; the first attempt at explanation, then, is based on the horror of blood among primitive races who consider blood as the seat of life. This blood taboo is seen in numerous kinds of observances which have nothing to do with sexuality; it is obviously connected with the prohibition against murder and forms a protective measure against the primal thirst for blood, *primaeval* man's pleasure in killing. According to this view the taboo of virginity is connected with the taboo of menstruation which is almost universally maintained. Primitive people cannot dissociate the puzzling phenomenon of this monthly flow of blood from sadistic ideas. Menstruation, especially its first appearance, is interpreted as the bite of some spirit-animal, perhaps as a sign of sexual intercourse with this spirit. Occasionally some report gives grounds for recognizing the spirit as that of an ancestor and then, supported by other findings,² we understand that the menstruating girl is taboo because she is the property of this ancestral spirit.

¹ In numerous other examples of marriage ceremonies there can be no doubt that people other than the bridegroom, for example his assistants and companions (our traditional 'groomsmen' [*Kranzelherren*]), are granted full sexual access to the bride.

² Cf. *Totem and Taboo* (1912-13).

Other considerations, however, warn us not to over-estimate the influence of a factor such as the horror of blood. It has not, after all, been strong enough to suppress practices like the circumcision of boys and the still more cruel equivalent with girls (excision of the clitoris and labia minora) which are to some extent the custom in these same races, nor to abolish the prevalence of other ceremonies involving bloodshed. It would not therefore be surprising, either, if this horror were overcome for the benefit of the husband on the occasion of the first cohabitation.

There is a second explanation, also unconcerned with sexuality, which has, however, a much more general scope than the first. It suggests that primitive man is prey to a perpetual lurking apprehensiveness, just as in the psycho-analytic theory of the neuroses we claim to be the case with people suffering from anxiety neurosis. This apprehensiveness will appear most strongly on all occasions which differ in any way from the usual, which involve something new or unexpected, something not understood or uncanny. This is also the origin of the ceremonial practices, widely adopted in later religions, which are connected with the beginning of every new undertaking, the start of every new period of time, the first-fruits of human, animal and plant life. The dangers which the anxious man believes to be threatening him never appear more vivid in his expectation than on the threshold of a dangerous situation, and then, too, is the only time when protecting himself against them is of any use. The first act of intercourse in marriage can certainly claim, on grounds of importance, to be preceded by such precautionary measures. These two attempts at explanation, based on horror of blood and on fear of first occurrences, do not contradict but rather reinforce each other. The first occasion of sexual intercourse is certainly a critical action, all the more so if it is to involve a flow of blood.

A third explanation - the one which Crawley prefers - draws attention to the fact that the taboo of virginity is part of a large totality which embraces the whole of sexual life. It is not only the first coitus with a woman which is taboo but sexual intercourse in general; one might almost say that women are altogether taboo. A woman is not only taboo in particular situations arising from her sexual life such as menstruation, pregnancy, childbirth and lying-in; apart from these situations, intercourse with women is subject to such solemn and numerous restrictions that we have every reason to doubt the reputed sexual freedom of savages. It is true that, on particular occasions, primitive man's sexuality will override all inhibitions; but for the most part it seems to be more strongly held in check by prohibitions than it is at higher levels of civilization. Whenever the man undertakes some special enterprise, like setting out on an expedition, a hunt or a campaign, he is obliged to keep away from his wife and especially from sexual intercourse with her; otherwise she will paralyse his strength and bring him bad luck. In the usages of daily life as well there is an unmistakable tendency to keep the sexes apart. Women live with women, men with men; family life, in our sense, seems scarcely to exist in many primitive tribes. This separation sometimes goes so far that one sex is not allowed to say aloud the personal names of members of the other sex, and that the women develop a language with a special vocabulary. Sexual needs will from time to time break through these barriers of separation afresh, but in some tribes even the encounters of husband and wife have to take place outside the house and in secret.

Wherever primitive man has set up a taboo he fears some danger and it cannot be disputed that a generalized dread of women is expressed in all these rules of avoidance. Perhaps this dread is based on the fact that woman is different from man, forever incomprehensible and mysterious, strange and therefore apparently hostile. The man is afraid of being weakened by the woman, infected with her femininity and of then showing himself incapable. The effect which coitus has on discharging tensions and causing flaccidity may be the prototype of what the man fears; and realization of the influence which the woman gains over him through sexual intercourse, the consideration she thereby forces from him, may justify the extension of this fear. In all this there is nothing obsolete, nothing which is not still alive among ourselves.

Many observers of primitive races living to-day have put forward the view that their impulsions in love are relatively weak and never reach the degree of intensity which we are accustomed to meet with in civilized men. Other observers have contradicted this opinion, but in any case the practice of the taboos we have described testifies to the existence of a force which opposes love by rejecting women as strange and hostile.

Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

We can see, however, that these latter considerations have led us to range far beyond our subject. The general taboo of women throws no light on the particular rules concerning the first sexual act with a virgin. As far as they are concerned, we have not got beyond the first two explanations, based on horror of blood and fear of first occurrences, and even these, we must point out, do not touch the core of the taboo in question. It is quite clear that the intention underlying this taboo is that of *denying or sparing precisely the future husband* something which cannot be dissociated from the first sexual act, although according to our introductory observations this very relation would lead to the woman becoming specially bound to this one man.

It is not our task on this occasion to discuss the origin and ultimate significance of taboo observances. I have done this in my book *Totem and Taboo*, where I have given due consideration to the part played by primal ambivalence in determining the formation of taboo and have traced the genesis of the latter from the prehistoric events which led to the founding of the human family. We can no longer recognize an original meaning of this kind in taboos observed among primitive tribes to-day. We forget all too easily, in expecting to find any such thing, that even the most primitive peoples exist in a culture far removed from that of primaeval days, which is just as old as our own from the point of view of time and like ours corresponds to a later, if different, stage of development.

To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old *motifs* replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

Now I believe that we shall receive some indication as to what this heightened danger is and why it threatens precisely the future husband, if we examine more closely the behaviour under the same circumstances of women of our own stage of civilization to-day. I will submit in advance, as the result of this examination, that such a danger really exists, so that with the taboo of virginity primitive man is defending himself against a correctly sensed, although psychical, danger.

We consider it to be the normal reaction for a woman after intercourse to embrace the man, pressing him to her at the climax of satisfaction, and we see this as an expression of her gratitude and a token of lasting bondage. But we know it is by no means the rule that the first occasion of intercourse should lead to this behaviour; very frequently it means only disappointment for the woman, who remains cold and unsatisfied, and it usually requires quite a long time and frequent repetition of the sexual act before she too begins to find satisfaction in it. There is an unbroken series from these cases of mere initial frigidity which soon vanishes, up to the cheerless phenomenon of permanent and obstinate frigidity which no tender efforts on the part of the husband can overcome. I believe this frigidity in women is not yet sufficiently understood and, except for those cases which must be blamed on the man's insufficient potency, calls for elucidation, possibly through allied phenomena.

I do not want to introduce at this point the attempts - which are so frequent - to take flight from the first occasion of sexual intercourse, because they are open to several interpretations and are in the main, although not altogether, to be understood as an expression of the general female tendency to take a defensive line. As against this, I do believe that light is thrown on the riddle of female frigidity by certain pathological cases in which, after the first and indeed after each repeated instance of sexual intercourse, the woman gives unconcealed expression to her hostility towards the man by abusing him, raising her hand against him or actually striking him. In one very clear case of this kind, which I was able to submit to a thorough analysis, this happened although the woman loved the man very much, used to demand intercourse herself and unmistakably found great satisfaction in it. I think that this strange, contradictory reaction is the result of the very same impulses which ordinarily can only find expression as frigidity - which, that is, can hold back the tender reaction without at the same time being able to put themselves into effect. In the pathological case we find separated so to speak into its two components what in the far more common instance of frigidity is united to produce an inhibiting effect, just like the process we have long recognized in the so-called 'diphasic symptoms' of obsessional neurosis. The danger which is thus aroused through the defloration of a woman would consist in drawing her hostility down upon oneself, and the prospective husband is just the person who would have every reason to avoid such enmity.

Now analysis enables us to infer without difficulty which impulses in women take part in bringing about this paradoxical behaviour, in which I expect to find the explanation of frigidity. The first act of intercourse mobilizes a number of impulses which are out of place in the desired feminine attitude, some of which, incidentally, need not recur during subsequent intercourse. In the first place we think of the pain which defloration causes a virgin, and we are perhaps even inclined to consider this factor as decisive and to give up the search for any others. But we cannot well ascribe such importance to this pain; we must rather substitute for it the narcissistic injury which proceeds from the destruction of an organ and which is even represented in a rationalized form in the knowledge that loss of virginity brings a diminution of sexual value. The marriage customs of primitive peoples, however, contain a warning against over-estimating this. We have heard that in some cases the rite falls into two phases: after the hymen has been ruptured (by hand or with some instrument) there follows a ceremonial act of coitus or mock-intercourse with the representatives of the husband, and this proves to us that the purpose of the taboo observance is not fulfilled by avoiding anatomical defloration, that the husband is to be spared something else as well as the woman's reaction to the painful injury.

We find a further reason for the disappointment experienced in the first act of intercourse in the fact that, with civilized women at least, fulfilment cannot be in accordance with expectations. Before this, sexual intercourse has been associated in the strongest possible way with prohibitions; lawful and permissible intercourse is not, therefore, felt to be the same thing. Just how close this association can be is demonstrated in an almost comic fashion by the efforts of so many girls about to be married to keep their new love-relationship secret from everyone outside, and indeed even from their parents, where there is no real necessity to do so and no objection can be looked for. Girls often say openly that their love loses value for them if other people know of it. On occasion this feeling can become dominating and can completely prevent the development of any capacity for love in a marriage. The woman only recovers her susceptibility to tender feelings in an illicit relationship which has to be kept secret, and in which alone she knows for certain that her own will is uninfluenced.

However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

The customs of primitive peoples seem to take account of this *motif* of the early sexual wish by handing over the task of defloration to an elder, priest or holy man, that is, to a substitute for the father (see above). There seems to me to be a direct path leading from this custom to the highly vexed question of the *jus primae noctis* of the mediaeval lord of the manor. A. J. Storfer (1911) has put forward the same view and has in addition, as Jung (1909) had already done before him, interpreted the widespread tradition of the 'Tobias nights' (the custom of continence during the first three nights of marriage) as an acknowledgement of the privilege of the patriarch. It agrees with our expectations, therefore, when we find the images of gods included among the father-surrogates entrusted with defloration. In some districts of India, the newly-married woman was obliged to sacrifice her hymen to the wooden lingam, and, according to St. Augustine's account, the same custom existed in the Roman marriage ceremony (of his time?), but modified so that the young wife only had to seat herself on the gigantic stone phallus of Priapus.¹

There is another motive, reaching down into still deeper layers, which can be shown to bear the chief blame for the paradoxical reaction towards the man, and which, in my view, further makes its influence felt in female frigidity. The first act of intercourse activates in a woman other impulses of long standing as well as those already described, and these are in complete opposition to her womanly role and function.

We have learnt from the analysis of many neurotic women that they go through an early age in which they envy their brothers their sign of masculinity and feel at a disadvantage and humiliated because of the lack of it (actually because of its diminished size) in themselves. We include this 'envy for the penis' in the 'castration complex'. If we understand 'masculine' as including the idea of wishing to be masculine, then the designation 'masculine protest' fits this behaviour; the phrase was coined by Adler with the intention of proclaiming this factor as being responsible for neurosis in general. During this phase, little girls often make no secret of their envy, nor of the hostility towards their favoured brothers which arises from it. They even try to urinate standing upright like their brothers in order to prove the equality which they lay claim to. In the case already described in which the woman used to show uncontrolled aggression after intercourse towards her husband, whom otherwise she loved, I was able to establish that this phase had existed before that of object-choice. Only later was the little girl's libido directed towards her father, and then, instead of wanting to have a penis, she wanted - a child.²

¹ Ploss and Bartels (1891, 1, xii) and Dulaure (1905, 142).

² Cf. 'On Transformations of Instinct as Exemplified in Anal Erotism' (1917c).

I should not be surprised if in other cases the order in which these impulses occurred were reversed and this part of the castration complex only became effective after a choice of object had been successfully made. But the masculine phase in the girl in which she envies the boy for his penis is in any case developmentally the earlier, and it is closer to the original narcissism than it is to object-love.

Some time ago I chanced to have an opportunity of obtaining insight into a dream of a newly-married woman which was recognizable as a reaction to the loss of her virginity. It betrayed spontaneously the woman's wish to castrate her young husband and to keep his penis for herself. Certainly there was also room for the more innocent interpretation that what she wished for was the prolongation and repetition of the act, but several details of the dream did not fit into this meaning and the character as well as the subsequent behaviour of the woman who had the dream gave evidence in favour of the more serious view. Behind this envy for the penis, there comes to light the woman's hostile bitterness against the man, which never completely disappears in the relations between the sexes, and which is clearly indicated in the strivings and in the literary productions of 'emancipated' women. In a palaeo-biological speculation, Ferenczi has traced back this hostility of women - I do not know if he is the first to do so - to the period in time when the sexes became differentiated. At first, in his opinion, copulation took place between two similar individuals, one of which, however, developed into the stronger and forced the weaker one to submit to sexual union. The feelings of bitterness arising from this subjection still persist in the present-day disposition of women. I do not think there is any harm in employing such speculations, so long as one avoids setting too much value on them.

After this enumeration of the motives for the paradoxical reaction of women to defloration, traces of which persist in frigidity, we may sum up by saying that a woman's *immature sexuality*, is discharged on to the man who first makes her acquainted with the sexual act. This being so, the taboo of virginity is reasonable enough and we can understand the rule which decrees that precisely the man who is to enter upon a life shared with this woman shall avoid these dangers. At higher stages of civilization the importance attributed to this danger diminishes in face of her promise of bondage and no doubt of other motives and inducements; virginity is looked upon as a possession which the husband is not called upon to renounce. But analysis of disturbed marriages teaches us that the motives which seek to drive a woman to take vengeance for her defloration are not completely extinguished even in the mental life of civilized women. I think it must strike the observer in how uncommonly large a number of cases the woman remains frigid and feels unhappy in a first marriage, whereas after it has been dissolved she becomes a tender wife, able to make her second husband happy. The archaic reaction has, so to speak, exhausted itself on the first object.

The taboo of virginity, however, even apart from this has not died out in our civilized existence. It is known to the popular mind and writers have on occasion made use of this material. A comedy by Anzengruber shows how a simple peasant lad is deterred from marrying his intended bride because she is 'a wench who'll cost her first his life'. For this reason he agrees to her marrying another man and is ready to take her when she is a widow and no longer dangerous. The title of the play, *Das Jungferngift* ['Virgin's Venom'], reminds us of the habit of snake-charmers, who make poisonous snakes first bite a piece of cloth in order to handle them afterwards without danger.¹

¹ A masterly short story by Arthur Schnitzler (*Das Schicksal des Freiherrn von Leisenbogh*) ['The Fate of Freiherr von Leisenbogh'] deserves to be included here, in spite of the rather different situation. The lover of an actress who is very experienced in love is dying as the result of an accident. He creates a sort of new virginity for her, by putting a curse of death on the man who is the first to possess her after himself. For a time the woman with this taboo upon her does not venture on any love-affair. However, after she has fallen in love with a singer, she hits on the solution of first granting a night to the Freiherr von Leisenbogh, who has been pursuing her for years. And the curse falls on him: he has a stroke as soon as he learns the motive behind his unexpected good fortune in love.

The taboo of virginity and something of its motivation has been depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy *Judith und Holofernes*. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her, 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly-married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is able to boast after her return that she has not been defiled, nor is there in the Biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

Sadger (1912) has shown in a penetrating analysis how Hebbel was determined in his choice of material by his own parental complex, and how he came to take the part of the woman so regularly in the struggle between the sexes, and to feel his way into the most hidden impulses of her mind. He also quotes the motives which the poet himself gives for the alteration he has made in the material, and he rightly finds them artificial and as though intended to justify *outwardly* something the poet himself is unconscious of, while at bottom concealing it. I will not dispute Sadger's explanation of why Judith, who according to the Biblical narrative is a widow, has to become a *virgin* widow. He refers to the purpose found in childish phantasies of denying the sexual intercourse of the parents and of turning the mother into an untouched virgin. But I will add: after the poet has established his heroine's virginity, his sensitive imagination dwells on the hostile reaction released by the violation of her maidenhood.

We may say, then, in conclusion that defloration has not only the one, civilized consequence of binding the woman lastingly to the man; it also unleashes an archaic reaction of hostility towards him, which can assume pathological forms that are frequently enough expressed in the appearance of inhibitions in the erotic side of married life, and to which we may ascribe the fact that second marriages so often turn out better than first. The taboo of virginity, which seems so strange to us, the horror with which, among primitive peoples, the husband avoids the act of defloration, are fully justified by this hostile reaction.

It is interesting that in one's capacity as analyst one can meet with women in whom the opposed reactions of bondage and hostility both find expression and remain intimately associated with each other. There are women of this kind who seem to have fallen out with their husbands completely and who all the same can only make vain efforts to free themselves. As often as they try to direct their love towards some other man, the image of the first, although he is no longer loved, intervenes with inhibiting effect. Analysis then teaches us that these women, it is true, still cling to their first husbands in a state of bondage, but no longer through affection. They cannot get away from them, because they have not completed their revenge upon them, and in pronounced cases they have not even brought the impulses for vengeance to consciousness.

THE PSYCHO-ANALYTIC VIEW OF PSYCHOGENIC DISTURBANCE OF VISION
(1910)

Intentionally left blank

THE PSYCHO-ANALYTIC VIEW OF PSYCHOGENIC DISTURBANCE OF VISION

GENTLEMEN, - I propose to take the example of psychogenic disturbance of vision, in order to show you the modifications which have taken place in our view of the genesis of disorders of this kind under the influence of psycho-analytic methods of investigation. As you know, hysterical blindness is taken as the type of a psychogenic visual disturbance. It is generally believed, as a result of the researches of the French School (including such men as Charcot, Janet and Binet), that the genesis of these cases is understood. For we are in a position to produce blindness of this kind experimentally if we have at our disposal someone who is susceptible to somnambulism. If we put him into deep hypnosis and suggest the idea to him that he sees nothing with one of his eyes, he will in fact behave as though he had become blind in that eye, like a hysteric who has developed a visual disturbance spontaneously. We may thus construct the mechanism of spontaneous hysterical disturbances of vision on the model of suggested hypnotic ones. In a hysteric the idea of being blind arises, not from the prompting of a hypnotist, but spontaneously - by autosuggestion, as people say; and in both cases this idea is so powerful that it turns into reality, exactly like a suggested hallucination, paralysis, etc.

This seems perfectly sound and will satisfy anyone who can ignore the many enigmas that lie concealed behind the concepts of hypnosis, suggestion and autosuggestion. Autosuggestion in particular raises further questions. When and under what conditions does an idea become so powerful that it is able to behave like a suggestion and turn into reality without more ado? Closer investigation has taught us that we cannot answer this question without calling the concept of the 'unconscious' to our assistance. Many philosophers rebel against the assumption of a mental unconscious of this kind, because they have not concerned themselves with the phenomena which compel us to make that assumption. Psychopathologists have found that they cannot avoid working with such things as unconscious mental processes, unconscious ideas, and so on.

Appropriate experiments have shown that people who are hysterically blind do nevertheless see in some sense, though not in the full sense. Excitations of the blind eye may have certain psychical consequences (for instance, they may produce affects) even though they do not become conscious. Thus hysterically blind people are only blind as far as consciousness is concerned; in their unconscious they see. It is precisely observations such as this that compel us to distinguish between conscious and unconscious mental processes.

How does it happen that such people develop the unconscious 'autosuggestion' that they are blind, while nevertheless they see in their unconscious? The reply given by the French researches is to explain that in patients predisposed to hysteria there is an inherent tendency to dissociation - to a falling apart of the connections in their mental field - as a consequence of which some unconscious processes do not continue as far as into the conscious. Let us leave entirely on one side the value that this attempted explanation may have as regards an understanding of the phenomena in question, and let us look at the matter from another angle. As you see, Gentlemen, the identity of hysterical blindness with the blindness provoked by suggestion, on which so much stress was laid to begin with, has now been given up. The hysterical patient is blind, not as the result of an autosuggestive idea that he cannot see, but as the result of a dissociation between unconscious and conscious processes in the act of seeing; his idea that he does not see is the well-founded *expression* of the psychical state of affairs and not its *cause*.

If, Gentlemen, you complain of the obscurity of this exposition I shall not find it easy to defend. I have tried to give you a synthesis of the views of different investigators, and in doing so I have probably coupled them together too closely. I wanted to condense into a single composite whole the concepts that have been brought up to make psychogenic disturbances intelligible - their origin from excessively powerful ideas, the distinction between conscious and unconscious mental processes and the assumption of mental dissociation. And I have been no more successful in this than the French writers, at whose head stands Pierre Janet. I hope, therefore, that you will excuse not only the obscurity but the inaccuracy of my exposition, and will allow me to tell you how psycho-analysis has led us to a view of psychogenic disturbances of vision which is more self-consistent and probably closer to the facts.

Psycho-analysis, too, accepts the assumptions of dissociation and the unconscious, but relates them differently to each other. Its view is a dynamic one, which traces mental life back to an interplay between forces that favour or inhibit one another. If in any instance one group of ideas remains in the unconscious, psycho-analysis does not infer that there is a constitutional incapacity for synthesis which is showing itself in this particular dissociation, but maintains that the isolation and state of unconsciousness of this group of ideas have been caused by an active opposition on the part of other groups. The process owing to which it has met with this fate is known as 'repression' and we regard it as something analogous to a condemnatory judgement in the field of logic. Psycho-analysis points out that repressions of this kind play an extraordinarily important part in our mental life, but that they may also frequently fail and that such failures of repression are the precondition of the formation of symptoms.

If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego' - a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

We have apparently digressed widely from our problem, though in doing so we have touched on the manner in which neurotic pathological conditions are related to our mental life as a whole. But let us now return to the narrower question. The sexual and ego-instincts alike have in general the same organs and systems of organs at their disposal. Sexual pleasure is not attached merely to the function of the genitals. The mouth serves for kissing as well as for eating and communication by speech; the eyes perceive not only alterations in the external world which are important for the preservation of life, but also characteristics of objects which lead to their being chosen as objects of love - their charms. The saying that it is not easy for anyone to serve two masters is thus confirmed. The closer the relation into which an organ with a dual function of this kind enters with *one* of the major instincts, the more it with holds itself from the other. This principle is bound to lead to pathological consequences if the two fundamental instincts are disunited and if the ego maintains a repression of the sexual component instinct concerned. It is easy to apply this to the eye and to seeing. Let us suppose that the sexual component instinct which makes use of looking - sexual pleasure in looking - has drawn upon itself defensive action by the ego-instincts in consequence of its excessive demands, so that the ideas in which its desires are expressed succumb to repression and are prevented from becoming conscious; in that case there will be a general disturbance of the relation of the eye and of the act of seeing to the ego and consciousness. The ego will have lost its dominance over the organ, which will now be wholly at the disposal of the repressed sexual instinct. It looks as though the repression had been carried too far by the ego, as though it had emptied the baby out with the bath-water: the ego refuses to see anything at all any more, now that the sexual interest in seeing has made itself so prominent. But the alternative picture seems more to the point. This attributes the active role instead to the repressed pleasure in looking. The repressed instinct takes its revenge for being held back from further psychical expansion, by becoming able to extend its dominance over the organ that is in its service. The loss of conscious dominance over the organ is the detrimental substitute for the repression which had miscarried and was only made possible at that price.

This relation of an organ with a double claim on it - its relation to the conscious ego and to repressed sexuality - is to be seen even more clearly in motor organs than in the eye: as when, for instance, a hand which has tried to carry out an act of sexual aggression, and has become paralysed hysterically, is unable, after that act has been inhibited, to do anything else as though it were obstinately insisting on carrying out a repressed innervation; or as when the fingers of people who have given up masturbation refuse to learn the delicate movements required for playing the piano or the violin. As regards the eye, we are in the habit of translating the obscure psychical processes concerned in the repression of sexual scopophilia and in the development of the psychogenic disturbance of vision as though a punishing voice was speaking from within the subject, and saying: 'Because you sought to misuse your organ of sight for evil sensual pleasures, it is fitting that you should not see anything at all any more', and as though it was in this way approving the outcome of the process. The idea of talion punishment is involved in this, and in fact our explanation of psychogenic visual disturbance coincides with what is suggested by myths and legends. The beautiful legend of Lady Godiva tells how all the town's inhabitants hid behind their shuttered windows, so as to make easier the lady's task of riding naked through the streets in broad daylight, and how the only man who peeped through the shutters at her revealed loveliness was punished by going blind. Nor is this the only example which suggests that neurotic illness holds the hidden key to mythology as well.

Psycho-analysis is unjustly reproached, Gentlemen, for leading to purely psychological theories of pathological problems. The emphasis which it lays on the pathogenic role of sexuality, which, after all, is certainly not an exclusively psychical factor should alone protect it from this reproach. Psycho-analysts never forget that the mental is based on the organic, although their work can only carry them as far as this basis and no beyond it. Thus psycho-analysis is ready to admit, and indeed to postulate, that not all disturbances of vision need be psychogenic, like those that are evoked by the repression of erotic scopophilia. If an organ which serves the two sorts of instinct increases its erotogenic role, it is in general to be expected that this will not occur without the excitability and innervation of the organ undergoing changes which will manifest themselves as disturbances of its function in the service of the ego. Indeed, if we find that an organ normally serving the purpose of sense-perception begins to behave like an actual genital when its erotogenic role is increased, we shall not regard it as improbable that *toxic* changes are also occurring in it. For lack of a better name we must retain the old unsuitable term of 'neurotic' disturbances for both classes of functional disturbances - those of physiological as well as those of toxic origin - which follow from an increase in the erotogenic factor. Generally speaking, the neurotic disturbances of vision stand in the same relation to the psychogenic ones as the 'actual neuroses' do to the psychoneuroses: psychogenic visual disturbances can no doubt hardly ever appear without neurotic ones, but the latter can appear without the former. These neurotic symptoms are unfortunately little appreciated and understood even today; for they are not directly accessible to psycho-analysis, and other methods of research have left the standpoint of sexuality out of account.

Yet another line of thought extending into organic research branches off from psycho-analysis. We may ask ourselves whether the suppression of sexual component instincts which is brought about by environmental influences is sufficient in itself to call up functional disturbances in organs, or whether special constitutional conditions must be present in order that the organs may be led to an exaggeration of their erotogenic role and consequently provoke repression of the instincts. We should have to see in those conditions the constitutional part of the disposition to fall ill of psychogenic and neurotic disorders. This is the factor to which, as applied to hysteria, I gave the provisional name of 'somatic compliance'.

‘WILD’ PSYCHO-ANALYSIS
(1910)

Intentionally left blank

'WILD' PSYCHO-ANALYSIS

A few days ago a middle-aged lady, under the protection of a female friend, called upon me for a consultation, complaining of anxiety-states. She was in the second half of her forties, fairly well preserved, and had obviously not yet finished with her womanhood. The precipitating cause of the outbreak of her anxiety-states had been a divorce from her last husband; but the anxiety had become considerably intensified, according to her account, since she had consulted a young physician in the suburb she lived in, for he had informed her that the cause of her anxiety was her lack of sexual satisfaction. He said that she could not tolerate the loss of intercourse with her husband, and so there were only three ways by which she could recover her health - she must either return to her husband, or take a lover, or obtain satisfaction from herself. Since then she had been convinced that she was incurable, for she would not return to her husband, and the other two alternatives were repugnant to her moral and religious feelings. She had come to me, however, because the doctor had said that this was a new discovery for which I was responsible, and that she had only to come and ask me to confirm what he said, and I should tell her that this and nothing else was the truth. The friend who was with her, an older, dried-up and unhealthy-looking woman, then implored me to assure the patient that the doctor was mistaken; it could not possibly be true, for she herself had been a widow for many years, and had nevertheless remained respectable without suffering from anxiety.

I will not dwell on the awkward predicament in which I was placed by this visit, but instead will consider the conduct of the practitioner who sent this lady to me. First, however, let us bear a reservation in mind which may possibly not be superfluous - indeed we will hope so. Long years of experience have taught me - as they could teach everyone else - not to accept straight away as true what patients, especially nervous patients, relate about their physician. Not only does a nerve-specialist easily become the object of many of his patients' hostile feelings, whatever method of treatment he employs; he must also sometimes resign himself to accepting responsibility, by a kind of projection, for the buried repressed wishes of his nervous patients. It is a melancholy but significant fact that such accusations nowhere find credence more readily than among other physicians.

I therefore have reason to hope that this lady gave me a tendentiously distorted account of what her doctor had said and that I do a man who is unknown to me an injustice by connecting my remarks about 'wild' psycho-analysis with this incident. But by doing so I may perhaps prevent others from doing harm to their patients.

Let us suppose, therefore, that her doctor spoke to the patient exactly as she reported. Everyone will at once bring us the criticism that if a physician thinks it necessary to discuss the question of sexuality with a woman he must do so with tact and consideration. Compliance with this demand, however, coincides with carrying out certain *technical rules* of psycho-analysis. Moreover, the physician in question was ignorant of a number of the *scientific theories* of psycho-analysis or had misapprehended them, and thus showed how little he had penetrated into an understanding of its nature and purposes.

Let us start with the latter, the *scientific* errors. The doctor's advice to the lady shows clearly in what sense he understands the expression 'sexual life' - in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psycho-analysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psycho-analysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically; we reckon as belonging to 'sexual life' all the activities of the tender feelings which have primitive sexual impulses as their source, even when those impulses have become inhibited in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this reason we prefer to speak of *psychosexuality*, thus laying stress on the point that the mental factor in sexual life should not be overlooked or underestimated. We use the word 'sexuality' in the same comprehensive sense as that in which the German language uses the word *lieben* ['to love']. We have long known, too, that mental absence of satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts.

Anyone not sharing this view of psychosexuality has no right to adduce psycho-analytic theses dealing with the aetiological importance of sexuality. By emphasizing exclusively the somatic factor in sexuality he undoubtedly simplifies the problem greatly, but he alone must bear the responsibility for what he does.

A second and equally gross misunderstanding is discernible behind the physician's advice.

It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?

Even if it could be justified scientifically, it is not advice that she can carry out. If she had had no inner resistances against masturbation or against a liaison she would of course have adopted one of these measures long before. Or does the physician think that a woman of over forty is unaware that one can take a lover, or does he over-estimate his influence so much as to think that she could never decide upon such a step without medical approval?

All this seems very clear, and yet it must be admitted there is one factor which often makes it difficult to form a judgement. Some nervous states which we call the 'actual neuroses', such as typical neurasthenia and pure anxiety neurosis, obviously depend on the somatic factor in sexual life, while we have no certain picture as yet of the part played in them by the psychical factor and by repression. In such cases it is natural that the physician should first consider some 'actual' therapy, some alteration in the patient's somatic sexual activity, and he does so with perfect justification if his diagnosis is correct. The lady who consulted the young doctor complained chiefly of anxiety-states, and so he probably assumed that she was suffering from an anxiety neurosis, and felt justified in recommending a somatic therapy to her. Again a convenient misapprehension! A person suffering from anxiety is not for that reason necessarily suffering from anxiety neurosis; such a diagnosis of it cannot be based on the name; one has to know what signs constitute an anxiety neurosis, and be able to distinguish it from other pathological states which are also manifested by anxiety. My impression was that the lady in question was suffering from anxiety *hysteria*, and the whole value of such nosographical distinctions, one which quite justifies them, lies in the fact that they indicate a different aetiology and a different treatment. No one who took into consideration the possibility of anxiety hysteria in this case would have fallen into the error of neglecting the mental factors, as this physician did with his three alternatives.

Oddly enough, the three therapeutic alternatives of this so-called psycho-analyst leave no room for - psycho-analysis! This woman could apparently only be cured of her anxiety by returning to her husband, or by satisfying her needs by masturbation or with a lover. And where does analytic treatment come in, the treatment which we regard as the main remedy in anxiety-states?

This brings us to the *technical* errors which are to be seen in the doctor's procedure in this alleged case. It is a long superseded idea, and one derived from superficial appearances, that the patient suffers from a sort of ignorance, and that if one removes this ignorance by giving him information (about the causal connection of his illness with his life, about his experiences in childhood, and so on) he is bound to recover. The pathological factor is not his ignorance in itself, but the root of this ignorance in his *inner resistances*; it was they that first called this ignorance into being, and they still maintain it now. The task of the treatment lies in combating these resistances. Informing the patient of what he does not know because he has repressed it is only one of the necessary preliminaries to the treatment. If knowledge about the unconscious were as important for the patient as people inexperienced in psycho-analysis imagine, listening to lectures or reading books would be enough to cure him. Such measures, however, have as much influence on the symptoms of nervous illness as a distribution of menu-cards in a time of famine has upon hunger. The analogy goes even further than its immediate application; for informing the patient of his unconscious regularly results in an intensification of the conflict in him and an exacerbation of his troubles.

Since, however, psycho-analysis cannot dispense with giving this information, it lays down that this shall not be done before two conditions have been fulfilled. First, the patient must, through preparation, himself have reached the neighbourhood of what he has repressed, and secondly, he must have formed a sufficient attachment (transference) to the physician for his emotional relationship to him to make a fresh flight impossible.

Only when these conditions have been fulfilled is it possible to recognize and to master the resistances which have led to the repression and the ignorance. Psycho-analytic intervention, therefore, absolutely requires a fairly long period of contact with the patient. Attempts to 'rush' him at first consultation, by brusquely telling him the secrets which have been discovered by the physician, are technically objectionable. And they mostly bring their own punishment by inspiring a hearty enmity towards the physician on the patient's part and cutting him off from having any further influence.

Besides all this, one may sometimes make a wrong surmise, and one is never in a position to discover the whole truth. Psycho-analysis provides these definite technical rules to replace the indefinable 'medical tact' which is looked upon as some special gift.

It is not enough, therefore, for a physician to know a few of the findings of psycho-analysis; he must also have familiarized himself with its technique if he wishes his medical procedure to be guided by a psycho-analytic point of view. This technique cannot yet be learnt from books, and it certainly cannot be discovered independently without great sacrifices of time, labour and success. Like other medical techniques, it is to be learnt from those who are already proficient in it. It is a matter of some significance, therefore, in forming a judgement on the incident which I took as a starting-point for these remarks, that I am not acquainted with the physician who is said to have given the lady such advice and have never heard his name.

Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in face of the dangers to patients and to the cause of psycho-analysis which are inherent in the practice that is to be foreseen of a 'wild' psycho-analysis, we have had no other choice. In the spring of 1910 we founded an International Psycho-Analytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psycho-analysis'. For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psycho-analysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psycho-analyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psycho-analysis. And this can be avoided.

CONTRIBUTIONS TO A DISCUSSION ON SUICIDE

I. INTRODUCTORY REMARKS

Gentlemen, - You have all listened with much satisfaction to the plea put forward by an educationalist who will not allow an unjustified charge to be levelled against the institution that is so dear to him. But I know that in any case you were not inclined to give easy credence to the accusation that schools drive their pupils to suicide. Do not let us be carried too far, however, by our sympathy with the party which has been unjustly treated in this instance. Not all the arguments put forward by the opener of the discussion seem to me to hold water. If it is the case that youthful suicide occurs not only among pupils in secondary schools but also among apprentices and others, this fact does not acquit the secondary schools; it must perhaps be interpreted as meaning that as regards its pupils the secondary school takes the place of the traumas with which other adolescents meet in other walks of life. But a secondary school should achieve more than not driving its pupils to suicide. It should give them a desire to live and should offer them support and backing at a time of life at which the conditions of their development compel them to relax their ties with their parental home and their family. It seems to me indisputable that schools fail in this, and in many respects fall short of their duty of providing a substitute for the family and of arousing interest in life in the world outside. This is not a suitable occasion for a criticism of secondary schools in their present shape; but perhaps I may emphasize a single point. The school must never forget that it has to deal with immature individuals who cannot be denied a right to linger at certain stages of development and even at certain disagreeable ones. The school must not take on itself the inexorable character of life: it must not seek to be more than a *game* of life.

II. CONCLUDING REMARKS

Gentlemen, - I have an impression that, in spite of all the valuable material that has been brought before us in this discussion, we have not reached a decision on the problem that interests us. We were anxious above all to know how it becomes possible for the extraordinarily powerful life instinct to be overcome: whether this can only come about with the help of a disappointed libido or whether the ego can renounce its self-preservation for its own egoistic motives. It may be that we have failed to answer this psychological question because we have no adequate means of approaching it. We can, I think, only take as our starting-point the condition of melancholia, which is so familiar to us clinically, and a comparison between it and the affect of mourning. The affective processes in melancholia, however, and the vicissitudes undergone by the libido in that condition, are totally unknown to us. Nor have we arrived at a psycho-analytic understanding of the chronic affect of mourning. Let us suspend our judgement till experience has solved this problem.

LETTER TO DR. FRIEDRICH S. KRAUS ON *ANTHROPOPHYTEIA*

My Dear Dr. Krauss,

You have asked me what scientific value can in my opinion be claimed by collections of erotic jokes, witticisms, funny stories, etc. I know you have not felt any doubt of being able to justify the making of such collections. You merely wanted me to bear witness from the standpoint of a psychologist to the fact that material of this kind is not only useful but indispensable.

There are two points upon which I should principally like to insist. When all is said and done, the erotic quips and comic anecdotes that you have collected and published in *Anthropophyteia* have only been produced and repeated because they gave pleasure both to their narrators and their hearers. It is not difficult to guess which components of the sexual instinct (compounded as it is from so many elements) find satisfaction in this manner. These tales give us direct information as to which of the component instincts of sexuality are retained in a given group of people as particularly efficient in producing pleasure; and in this way they give the neatest confirmation of the findings reached by the psycho-analytic examination of neurotics. Allow me to indicate the most important example of this kind. Psycho-analysis has led us to assert that the anal region - normally and not only in perverse individuals - is the site of an erotogenic sensitivity, and that in certain ways it behaves exactly like a genital organ. Doctors and psychologists, when told of there being an anal erotism and an anal character derived from it, have been highly indignant. At this point *Anthropophyteia* comes to the help of psycho-analysis by showing how universally people dwell with pleasure upon this part of the body, its performances and indeed the product of its function. If this were not so, all these anecdotes would be bound to give rise to disgust in their hearers or else the whole mass of the population would have to be 'perverse' in the sense in which the word is used in works dealing with 'psychopathia sexualis' in a moralizing tone. It would not be hard to give other instances of how the material collected by the authors of *Anthropophyteia* has been of value for the researches of sexual psychology. Its value may even be increased, perhaps, by the circumstance (not in itself an advantage) that the collectors know nothing of the theoretical findings of psycho-analysis and have brought together the material without any guiding principles.

Another advantage of a wider character is presented in particular by erotic jokes, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the construction of jokes. In psycho-analysis to-day we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of investigating the unconscious human mind - in the same way as do dreams, myths and legends, with the exploitation of which psycho-analysis is already actively engaged.

It is therefore safe to hope that the psychological importance of folklore will be more and more clearly recognized, and that the relations between that branch of study and psycho-analysis will soon become more intimate.

I remain, dear Dr. Krauss, yours very sincerely,

FREUD

June 26, 1910

TWO INSTANCES OF PATHOGENIC PHANTASIES REVEALED BY THE PATIENTS THEMSELVES

A

A short while ago I saw a patient, about twenty years of age, who gave an unmistakable picture (confirmed by other opinions) of a dementia praecox (hebephrenia). During the initial stages of his illness he had exhibited periodic changes of mood and had made a considerable improvement. While he was in this favourable condition he was removed from the institution by his parents and for about a week he was regaled with entertainments of every kind to celebrate his supposed recovery. His relapse followed immediately upon this week of festivities. When he was brought back to the institution, he said that the consulting physician had advised him 'to flirt with his mother a little'. There can be no doubt that in this delusory paramnesia he was giving expression to the excitement which had been provoked in him by being in his mother's company and which had been the immediate provocation of his relapse.

B

More than ten years ago, at a time when the findings and hypotheses of psycho-analysis were known to only a few people, the following events were reported to me from a trustworthy source. A girl, who was the daughter of a medical man, fell ill of hysteria with local symptoms. Her father denied that it was hysteria and arranged for various somatic treatments to be initiated, which brought little improvement. One day a woman friend of the patient's said to her: 'Have you never thought of consulting Dr. F.?' To which the patient replied: 'What good would that be? I know he'd say to me: "Have you ever had the idea of having sexual intercourse with your father?"' - It seems unnecessary for me to say explicitly that it has never been my practice and is not my practice to-day to ask such questions. But it is worth remarking that much of what patients report of the words and actions of their physicians may be understood as revelations of their own pathogenic phantasies.

REVIEW OF WILHELM NEUTRA'S *LETTERS TO NEUROTIC WOMEN*

It should be taken as an encouraging sign of the awakening interest in psychotherapy that a second edition of this book has been called for so quickly. Unluckily we cannot hail the book itself as an encouraging phenomenon. The author, who is an assistant physician in the Gainfarn hydropathic institute near Vienna, has borrowed the form of Oppenheim's *Psychotherapeutische Briefe* and has given that form a psycho-analytic content. This is in a sense ill-judged, since psycho-analysis cannot be satisfactorily combined with Oppenheim's (or, if that is preferred, Dubois') technique of 'persuasion'; it looks for it therapeutic results along quite other paths. What is more important, however, is the fact that the author fails to attain the merits of his model - tact and moral seriousness - and that in his presentation of psycho-analytic theory he often drops into empty rhetoric and is also guilty of some misstatements. Nevertheless much of what he writes is neatly and aptly expressed; and the book may pass muster as a work for popular consumption. In a more serious, scientific exposition of the subject the author would have had to indicate the sources of his views and assertions with greater conscientiousness.

PSYCHO-ANALYTIC NOTES ON AN AUTOBIOGRAPHICAL ACCOUNT
OF A CASE OF PARANOIA
(DEMENTIA PARANOIDES)
(1911)

Intentionally left blank

PSYCHO-ANALYTIC NOTES ON AN AUTOBIOGRAPHICAL ACCOUNT
OF A CASE OF PARANOIA
(DEMENTIA PARANOIDES)

The analytic investigation of paranoia presents difficulties of a peculiar nature to physicians who, like myself, are not attached to public institutions. We cannot accept patients suffering from this complaint, or, at all events, we cannot keep them for long, since we cannot offer treatment unless there is some prospect of therapeutic success. It is only in exceptional circumstances, therefore, that I succeed in getting more than a superficial view of the structure of paranoia - when, for instance, the diagnosis (which is not always an easy matter) is uncertain enough to justify an attempt at influencing the patient, or when, in spite of an assured diagnosis, I yield to the entreaties of the patient's relatives and undertake to treat him for a time. Apart from this, of course, I see plenty of cases of paranoia and of dementia praecox, and I learn as much about them as other psychiatrists do about their cases; but that is not enough, as a rule, to lead to any analytic conclusions.

The psycho-analytic investigation of paranoia would be altogether impossible if the patients themselves did not possess the peculiarity of betraying (in a distorted form, it is true) precisely those things which other neurotics keep hidden as a secret. Since paranoics cannot be compelled to overcome their internal resistances, and since in any case they only say what they choose to say, it follows that this is precisely a disorder in which a written report or a printed case history can take the place of personal acquaintance with the patient. For this reason I think it is legitimate to base analytic interpretations upon the case history of a patient suffering from paranoia (or, more precisely, from dementia paranoides) whom I have never seen, but who has written his own case history and brought it before the public in print.

I refer to Dr. jur. Daniel Paul Schreber, formerly Senatspräsident in Dresden, whose book, *Denkwürdigkeiten eines Nervenkranken* [*Memoirs of a Nerve Patient*], was published in 1903, and, if I am rightly informed, aroused considerable interest among psychiatrists. It is possible that Dr. Schreber may still be living to-day and that he may have dissociated himself so far from the delusional system which he put forward in 1903 as to be pained by these notes upon his book. In so far, however, as he still retains his identity with his former personality, I can rely upon the arguments with which he himself - 'a man of superior mental gifts and endowed with an unusual keenness alike of intellect and of observation'¹ - countered the efforts that were made to restrain him from publishing his memoirs: 'I have been at no pains', he writes, 'to close my eyes to the difficulties that would appear to lie in the path of publication, and in particular to the problem of paying due regard to the susceptibilities of certain persons still living. On the other hand, I am of opinion that it might well be to the advantage both of science and of the recognition of religious truths if, during my life-time, qualified authorities were enabled to undertake some examination of my body and to hold some enquiry into my personal experiences. To this consideration all feelings of a personal character must yield.'² He declares in another passage that he has decided to keep to his intention of publishing the book, even if the consequence were to be that his physician, Geheimrat Dr. Flechsig of Leipzig, brought an action against him. He urges upon Dr. Flechsig, however, the same considerations that I am now urging upon him himself: 'I trust', he says, 'that even in the case of Geheimrat Prof. Dr. Flechsig any personal susceptibilities that he may feel will be outweighed by a scientific interest in the subject-matter of my memoirs.' (446.)³

Though all the passages from the *Denkwürdigkeiten* upon which my interpretations are based will be quoted verbatim in the following pages, I would ask my readers to make themselves acquainted with the book by reading it through at least once beforehand.

¹ This piece of self-portraiture, which is certainly not unjustified, will be found on page 35 of his book.

² Preface, iii.

³ [Throughout this paper figures in brackets with no preceding 'p.' are page references to the original German edition of Schreber's memoirs - *Denkwürdigkeiten eines Nervenkranken*, Leipzig, Oswald Mutze.]

I

CASE HISTORY

'I have suffered twice from nervous disorders', writes Dr. Schreber, 'and each time as a result of mental overstrain. This was due on the first occasion to my standing as a candidate for election to the Reichstag while I was Landgerichtsdirektor at Chemnitz, and on the second occasion to the very heavy burden of work that fell upon my shoulders when I entered on my new duties as Senatspräsident in the Oberlandesgericht in Dresden.' (34.)

Dr. Schreber's first illness began in the autumn of 1884, and by the end of 1885 he had completely recovered. During this period he spent six months in Flechsig's clinic, and the latter, in a formal report which he drew up at a later date, described the disorder as an attack of severe hypochondria. Dr. Schreber assures us that this illness ran its course 'without the occurrence of any incidents bordering upon the sphere of the supernatural'. (35.)

Neither the patient's own account, nor the reports of the physicians which are reprinted at the end of his book, tell us enough about his previous history or his personal circumstances. I am not even in a position to give the patient's age at the time of his illness, though the high judicial position which he had attained before his second illness establishes some sort of lower limit. We learn that Dr. Schreber had been married long before the time of his 'hypochondria'. 'The gratitude of my wife', he writes, 'was perhaps even more heartfelt; for she revered Professor Flechsig as the man who had restored her husband to her, and hence it was that for years she kept his portrait standing upon her writing-table.' (36.) And in the same place: 'After my recovery from my first illness I spent eight years with my wife - years, upon the whole, of great happiness, rich in outward honours, and only clouded from time to time by the oft repeated disappointment of our hope that we might be blessed with children.'

In June, 1893, he was notified of his prospective appointment as *Senatspräsident*, and he took up his duties on the first of October of the same year. Between these two dates¹ he had some dreams, though it was not until later that he came to attach any importance to them. He dreamt two or three times that his old nervous disorder had come back; and this made him as miserable in the dream as the discovery that it was only a dream made him happy when he woke up. Once, in the early hours of the morning, moreover, while he was in a state between sleeping and waking, the idea occurred to him 'that after all it really must be very nice to be a woman submitting to the act of copulation'. (36.) This idea was one which he would have rejected with the greatest indignation if he had been fully conscious.

The second illness set in at the end of October 1893 with a torturing bout of sleeplessness. This forced him to return to the Flechsig clinic, where, however, his condition grew rapidly worse. The further course of the illness is described in a Report drawn up subsequently by the director of the Sonnenstein Asylum: 'At the commencement of his residence there² he expressed more hypochondriacal ideas, complained that he had softening of the brain, that he would soon be dead, etc. But ideas of persecution were already finding their way into the clinical picture, based upon sensory illusions which, however, seemed only to appear sporadically at first; while simultaneously a high degree of hyperaesthesia was observable - great sensitiveness to light and noise. - Later, the visual and auditory illusions became much more frequent, and, in conjunction with coenaesthetic disturbances, dominated the whole of his feeling and thought. He believed that he was dead and decomposing, that he was suffering from the plague; he asserted that his body was being handled in all kinds of revolting ways; and, as he himself declares to this day, he went through worse horrors than any one could have imagined, and all on behalf of a holy purpose. The patient was so much pre-occupied with these pathological experiences that he was inaccessible to any other impression and would sit perfectly rigid and motionless for hours (hallucinatory stupor). On the other hand, they tortured him to such a degree that he longed for death. He made repeated attempts at drowning himself in his bath, and asked to be given the "cyanide that was intended for him". His delusional ideas gradually assumed a mystical and religious character; he was in direct communication with God, he was the plaything of devils, he saw "miraculous apparitions", he heard "holy music", and in the end he even came to believe that he was living in another world.' (380.)

¹ And therefore before he could have been affected by the overwork caused by his new post, to which he attributes his illness.

² In Professor Flechsig's clinic at Leipzig.

It may be added that there were certain people by whom he thought he was being persecuted and injured, and upon whom he poured abuse. The most prominent of these was his former physician, Flechsig, whom he called a 'soul-murderer'; and he used to call out over and over again: '*Little* Flechsig!' putting a sharp stress upon the first word (383). He was moved from Leipzig, and, after a short interval spent in another institution, was brought in June 1894 to the Sonnenstein Asylum, near Pirna, where he remained until his disorder assumed its final shape. In the course of the next few years the clinical picture altered in a manner which can best be described in the words of Dr. Weber, the director of the asylum.

'I need not enter any further into the details of the course of the disease. I must, however, draw attention to the manner in which, as time went on, the initial comparatively acute psychosis, which had directly involved the patient's entire mental life and deserved the name of "hallucinatory insanity", developed more and more clearly (one might almost say crystallized out) into the paranoid clinical picture that we have before us to-day.' (385.) The fact was that, on the one hand, he had developed an ingenious delusional structure, in which we have every reason to be interested, while, on the other hand, his personality had been reconstructed and now showed itself, except for a few isolated disturbances, capable of meeting the demands of everyday life.

Dr. Weber, in his Report of 1899, makes the following remarks: 'It thus appears that at the present time, apart from certain obvious psychomotor symptoms which cannot fail to strike even the superficial observer as being pathological, Herr Senatspräsident Dr. Schreber shows no signs of confusion or of psychical inhibition, nor is his intelligence noticeably impaired. His mind is collected, his memory is excellent, he has at his disposal a very considerable store of knowledge (not merely upon legal questions, but in many other fields), and he is able to reproduce it in a connected train of thought. He takes an interest in following events in the world of politics, science and art, etc., and is constantly occupied with such matters . . . and an observer who was uninstructed upon his general condition would scarcely notice anything peculiar in these directions. In spite of all this, however, the patient is full of ideas of pathological origin, which have formed themselves into a complete system; they are more or less fixed, and seem to be inaccessible to correction by means of any objective appreciation and judgement of the external facts.' (305-6.)

Thus the patient's condition had undergone a great change, and he now considered himself capable of carrying on an independent existence. He accordingly took appropriate steps with a view to regaining control over his own affairs and to securing his discharge from the asylum. Dr. Weber set himself to prevent the fulfilment of these intentions and drew up reports in opposition to them. Nevertheless, in his Report dated 1900, he felt obliged to give this appreciative account of the patient's character and conduct: 'Since for the last nine months Herr Präsident Schreber has taken his meals daily at my family board, I have had the most ample opportunities of conversing with him upon every imaginable topic, Whatever the subject was that came up for discussion (apart, of course, from his delusional ideas), whether it concerned events in the field of administration and law, of politics, art, literature or social life - in short, whatever the topic, Dr. Schreber gave evidence of a lively interest, a well-informed mind, a good memory, and a sound judgement; his ethical outlook, moreover, was one which it was impossible not to endorse. So, too, in his lighter talk with the ladies of the party, he was both courteous and affable, and when he touched upon matters in a more humorous vein he invariably displayed tact and decorum. Never once, during these innocent talks round the dining-table, did he introduce subjects which should more properly have been raised at a medical consultation.' (397-8.) Indeed, on one occasion during this period when a business question arose which involved the interests of his whole family, he entered into it in a manner which showed both his technical knowledge and his common sense (401 and 510).

In the numerous applications to the courts, by which Dr. Schreber endeavoured to regain his liberty, he did not in the least disavow his delusions or make any secret of his intention of publishing the *Denkwürdigkeiten*. On the contrary, he dwelt upon the importance of his ideas to religious thought, and upon their invulnerability to the attacks of modern science; but at the same time he laid stress upon the 'absolute harmlessness' (430) of all the actions which, as he was aware, his delusions obliged him to perform. Such, indeed, were his acumen and the cogency of his logic that finally, and in spite of his being an acknowledged paranoic, his efforts were crowned with success. In July, 1902, Dr. Schreber's civil rights were restored, and in the following year his *Denkwürdigkeiten eines Nervenkranken* appeared, though in a censored form and with many valuable portions omitted.

The Court Judgement that gave Dr. Schreber back his liberty summarizes the content of his delusional system in a few sentences: 'He believed that he had a mission to redeem the world and to restore it to its lost state of bliss. This, however, he could only bring about if he were first transformed from a man into a woman.' (475.)

For a more detailed account of his delusions as they appeared in their final shape we may turn to Dr. Weber's Report of 1899: 'The culminating point of the patient's delusional system is his belief that he has a mission to redeem the world, and to restore mankind to their lost state of bliss. He was called to this task, so he asserts, by direct inspiration from God, just as we are taught that the Prophets were; for nerves in a condition of great excitement, as his were for a long time, have precisely the property of exerting an attraction upon God - though this is touching on matters which human speech is scarcely, if at all, capable of expressing, since they lie entirely outside the scope of human experience and, indeed, have been revealed to him alone. The most essential part of his mission of redemption is that it must be preceded by his *transformation into a woman*. It is not to be supposed that he *wishes* to be transformed into a woman; it is rather a question of a "must" based upon the Order of Things, which there is no possibility of his evading, much as he would personally prefer to remain in his own honourable and masculine station in life. But neither he nor the rest of mankind can regain the life beyond except by his being transformed into a woman (a process which may occupy many years or even decades) by means of divine miracles. He himself, of this he is convinced, is the only object upon which divine miracles are worked, and he is thus the most remarkable human being who has ever lived upon earth. Every hour and every minute for years he has experienced these miracles in his body, and he has had them confirmed by the voices that have conversed with him. During the first years of his illness certain of his bodily organs suffered such destructive injuries as would inevitably have led to the death of any other man: he lived for a long time without a stomach, without intestines, almost without lungs, with a torn oesophagus, without a bladder, and with shattered ribs, he used sometimes to swallow part of his own larynx with his food, etc. But divine miracles ("rays") always restored what had been destroyed, and therefore, as long as he remains a man, he is altogether immortal. These alarming phenomena have ceased long ago, and his "femaleness" has become prominent instead. This is a matter of a process of development which will probably require decades, if not centuries, for its completion, and it is unlikely that anyone now living will survive to see the end of it. He has a feeling that enormous numbers of "female nerves" have already passed over into his body, and out of them a new race of men will proceed, through a process of direct impregnation by God. Not until then, it seems, will he be able to die a natural death, and, along with the rest of mankind, will he regain a state of bliss. In the meantime not only the sun, but trees and birds, which are in the nature of "bemiracled residues of former human souls", speak to him in human accents, and miraculous things happen everywhere around him.' (386-8.)

The interest felt by the practical psychiatrist in such delusional formations as these is, as a rule, exhausted when once he has ascertained the character of the products of the delusion and has formed an estimate of their influence on the patient's general behaviour: in his case marvelling is not the beginning of understanding. The psycho-analyst, in the light of his knowledge of the psychoneuroses, approaches the subject with a suspicion that even thought-structures so extraordinary as these and so remote from our common modes of thinking are nevertheless derived from the most general and comprehensible impulses of the human mind; and he would be glad to discover the motives of such a transformation as well as the manner in which it has been accomplished. With this aim in view, he will wish to go more deeply into the details of the delusion and into the history of its development.

(a) The medical officer lays stress upon two points as being of chief importance: the patient's *assumption of the role of Redeemer*, and his *transformation into a woman*. The Redeemer delusion is a phantasy that is familiar to us through the frequency with which it forms the nucleus of religious paranoia. The additional factor, which makes the redemption dependent upon the man being previously transformed into a woman, is unusual and in itself bewildering, since it shows such a wide divergence from the historical myth which the patient's phantasy is setting out to reproduce. It is natural to follow the medical report in assuming that the motive force of this delusional complex was the patient's ambition to play the part of Redeemer, and that his *emasculation* was only entitled to be regarded as a means for achieving that end. Even though this may appear to be true of his delusion in its final form, a study of the *Denkwürdigkeiten* compels us to take a very different view of the matter. For we learn that the idea of being transformed into a woman (that is, of being emasculated) was the primary delusion, that he began by regarding that act as constituting a serious injury and persecution, and that it only became related to his playing the part of Redeemer in a secondary way. There can be no doubt, moreover, that originally he believed that the transformation was to be effected for the purpose of sexual abuse and not so as to serve higher designs. The position may be formulated by saying that a sexual delusion of persecution was later on converted in the patient's mind into a religious delusion of grandeur. The part of persecutor was at first assigned to Professor Flechsig, the physician in whose charge he was; later, his place was taken by God Himself.

I will quote the relevant passages from the *Denkwürdigkeiten* in full: 'In this way a conspiracy against me was brought to a head (in about March or April, 1894). Its object was to contrive that, when once my nervous complaint had been recognized as incurable or assumed to be so, I should be handed over to a certain person in a particular manner: my soul was to be delivered up to him, but my body - owing to a misapprehension of what I have described above as the purpose underlying the Order of Things - was to be transformed into a female body: and as such surrendered to the person in question¹ with a view to sexual abuse, and was then simply to be "left on one side" - that is to say, no doubt, given over to corruption.' (56.)

'It was, moreover, perfectly natural that from the human standpoint (which was the one by which at that time I was still chiefly governed) I should regard Professor Flechsig or his soul as my only true enemy - at a later date there was also the von W. soul, about which I shall have more to say presently - and that I should look upon God Almighty as my natural ally. I merely fancied that He was in great straits as regards Professor Flechsig, and consequently felt myself bound to support him by every conceivable means, even to the length of sacrificing myself. It was not until very much later that the idea forced itself upon my mind that God Himself had played the part of accomplice, if not of instigator, in the plot whereby my soul was to be murdered and my body used like a strumpet. I may say, in fact, that this idea has in part become clearly conscious to me only in the course of writing the present work.' (59.)

'Every attempt at murdering my soul, or at emasculating me for purposes *contrary to the Order of Things* (that is, for the gratification of the sexual appetites of a human individual), or later at destroying my understanding - every such attempt has come to nothing. From this apparently unequal struggle between one weak man and God Himself, I have emerged as the victor - though not without undergoing much bitter suffering and privation - because the Order of Things stands upon my side.' (61.)

In a footnote attached to the words '*contrary to the Order of Things*' in the above passage, the author foreshadows the subsequent transformation in his delusion of emasculation and in his relation to God: 'I shall show later on that emasculation for quite another purpose - a purpose *in consonance with the Order of Things* - is within the bounds of possibility, and, indeed, that it may quite probably afford the solution of the conflict.'

¹ It is shown from the context in this and other passages that 'the person in question' who was to practise this abuse was none other than Flechsig. (See below.)

These statements are of decisive importance in determining the view we are to take of the delusion of emasculation and in thus giving us a general understanding of the case. It may be added that the 'voices' which the patient heard never treated his transformation into a woman as anything but a sexual disgrace, which gave them an excuse for jeering at him. 'Rays of God' not infrequently thought themselves entitled to mock at me by calling me "Miss² Schreber", in allusion to the emasculation which, it was alleged, I was about to undergo.' (127.) Or they would say: 'So *this* sets up to have been a Senatspräsident, this person who lets himself be f--d!'³ Or again: 'Don't you feel ashamed in front of your wife?'

That the emasculation phantasy was of a primary nature and originally independent of the Redeemer *motif* becomes still more probable when we recollect the 'idea' which, as I mentioned on an earlier page, occurred to him while he was half asleep, to the effect that it must be nice to be a woman submitting to the act of copulation (36.) This phantasy appeared during the incubation period of his illness, and before he had begun to feel the effects of overwork in Dresden.

Schreber himself gives the month of November, 1895, as the date at which the connection was established between the emasculation phantasy and the Redeemer idea and the way thus paved for his becoming reconciled to the former. 'Now, however,' he writes, 'I became clearly aware that the Order of Things imperatively demanded my emasculation, whether I personally liked it or no, and that no *reasonable* course lay open to me but to reconcile myself to the thought of being transformed into a woman. The further consequence of my emasculation could, of course, only be my impregnation by divine rays to the end that a new race of men might be created.' (177.)

¹ The 'rays of God', as we shall see, are identical with the voices which talked the 'basic language'.

² [In English in the original.]

³ I reproduce this omission from the *Denkwürdigkeiten*, just as I do all the peculiarities of their author's way of writing. I myself should have found no reason for being so shamefaced over a serious matter.

The idea of being transformed into a woman was the salient feature and the earliest germ of his delusional system. It also proved to be the one part of it that persisted after his cure, and the one part that was able to retain a place in his behaviour in real life after he had recovered. 'The *only thing* which could appear unreasonable in the eyes of other people is the fact, already touched upon in the expert's report, that I am sometimes to be found standing before the mirror or elsewhere with the upper portion of my body bared, and wearing sundry feminine adornments, such as ribbons, false necklaces, and the like. This only occurs, I may add, when I am *by myself*, and never, at least so far as I am able to avoid it, in the presence of other people.' (429.) The Herr Senatspräsident confesses to this frivolity at a date (July, 1901) at which he was already in a position to express very aptly the completeness of his recovery in the region of practical life: 'I have now long been aware that the persons I see about me are not "cursorily improvised men" but real people, and that I must therefore behave towards them as a reasonable man is used to behave towards his fellows.' (409.) In contrast to the way in which he put his emasculation phantasy into action, the patient never took any steps towards inducing people to recognize his mission as Redeemer, beyond the publication of his *Denkwürdigkeiten*.

(b) The attitude of our patient towards *God* is so singular and so full of internal contradictions that it requires more than a little faith to persist in the belief that there is nevertheless 'method' in his 'madness'. With the help of what Dr. Schreber tells us in the *Denkwürdigkeiten*, we must now endeavour to arrive at a more exact view of his theologico-psychological system, and we must expound his opinions concerning *nerves, the state of bliss, the divine hierarchy, and the attributes of God*, in their manifest (delusional) nexus. At every point in his theory we shall be struck by the astonishing mixture of the commonplace and the clever, of what has been borrowed and what is original.

The human soul is comprised in the *nerves* of the body. These are to be conceived of as structures of extraordinary fineness, comparable to the finest thread. Some of these nerves are suited only for the reception of sense-perceptions, while others (*the nerves of understanding*) carry out all the functions of the mind; and in this connection it is to be noticed that *each single nerve of understanding represents a person's entire mental individuality*, and that the presence of a greater or lesser number of nerves of understanding has no influence except upon the length of time during which the mind can retain its impressions.¹

Whereas men consist of bodies and nerves, God is from His very nature nothing but nerve. But the nerves of God are not, as is the case with human bodies, present in limited numbers, but are infinite or eternal. They possess all the properties of human nerves to an enormously intensified degree. In their creative capacity - that is, their power of turning themselves into every imaginable object in the created world - they are known as *rays*. There is an intimate relation between God and the starry heaven and the sun.²

¹ The words in which Schreber states this theory are italicized by him, and he adds a footnote, in which he insists that it can be used as an explanation of heredity: 'The male semen', he declares, 'contains a nerve belonging to the father, and it unites with a nerve taken from the mother's body to form a new entity.' (7.) Here, therefore, we find a quality properly belonging to the spermatozoon transferred on to the nerves, which makes it probable that Schreber's 'nerves' are derived from the sphere of ideas connected with sexuality. It not infrequently happens in the *Denkwürdigkeiten* that an incidental note upon some piece of delusional theory gives us the desired indication of the genesis of the delusion and so of its meaning.

² In this connection see my discussion below on the significance of the sun. - The comparison between (or rather the condensation of) nerves and rays may well have been based on the linear extension which they have in common. The ray-nerves, by the way, are no less creative than the spermatozoon-nerves.

When the work of creation was finished, God withdrew to an immense distance (10-11 and 252) and, in general, resigned the world to its own laws. He limited His activities to drawing up to Himself the souls of the dead. It was only in exceptional instances that He would enter into relations with particular, highly gifted persons,¹ or would intervene by means of a miracle in the destinies of the world. God does not have any regular communication with human souls, in accordance with the Order of Things, till after death.² When a man dies, his spiritual parts (that is, his nerves) undergo a process of purification before being finally reunited with God Himself as 'fore-courts of Heaven'. Thus it comes about that everything moves in an eternal round, which lies at the basis of the Order of Things. In creating anything, God is parting with a portion of Himself, or is giving a portion of His nerves a different shape. The apparent loss which He thus sustains is made good when, after hundreds and thousands of years, the nerves of dead men, that have entered the state of bliss, once more accrue to Him as 'fore-courts of Heaven' (18 and 19 *n.*).

Souls that have passed through the process of purification enter into the enjoyment of a *state of bliss*.³ In the meantime they have lost some of their individual consciousness, and have become fused together with other souls into higher unities. Important souls, such as those of men like Goethe, Bismarck, etc., may have to retain their sense of identity for hundreds of years to come, before they too can become resolved into higher soul-complexes, such as 'Jehovah rays' in the case of ancient Jewry: or 'Zoroaster rays' in the case of ancient Persia. In the course of their purification 'souls learn the language which is spoken by God himself, the so-called "basic language", a vigorous though somewhat antiquated German, which is especially characterized by its great wealth of euphemisms'.⁴ (13.)

¹ In the 'basic language' (see below) this is described as 'making a nerve-connection with them'.

² We shall find later that certain criticisms against God are based on this fact.

³ This consists essentially in a feeling of voluptuousness (see below).

⁴ On one single occasion during his illness the patient was vouchsafed the privilege of seeing, with his spiritual eyes, God Almighty clear and undisguised before him. On that occasion God uttered what was a very current word in the basic language, and a forcible though not an amiable one - the word 'Slut!' (136). [In German '*Luder*'. This term of abuse is occasionally applied to males, though much more often to females.]

God Himself is not a simple entity. 'Above the "fore-courts of Heaven" hovered God Himself, who, in contradistinction to these "anterior realms of God", was also described as the "posterior realms of God". The posterior realms of God were, and still are, divided in a strange manner into two parts, so that a lower God (Ahriman) was differentiated from an upper God (Ormuzd).' (19.) As regards the significance of this division Schreber can tell us no more than that the lower God was more especially attached to the peoples of a dark race (the Semites) and the upper God to those of a fair race (the Aryans); nor would it be reasonable, in such sublime matters, to expect more of human knowledge. Nevertheless, we are also told that 'in spite of the fact that in certain respects God Almighty forms a unity, the lower and the upper God must be regarded as separate Beings, each of which possesses its own particular egoism and its own particular instinct of self-preservation, *even in relation to the other*, and each of which is therefore constantly endeavouring to thrust itself in front of the other' (140 n.). Moreover, the two divine Beings behaved in quite different ways towards the unlucky Schreber during the acute stage of his illness.¹

In the days before his illness Senatspräsident Schreber had been a doubter in religious matters (29 and 64); he had never been able to persuade himself into a firm belief in the existence of a personal God. Indeed, he adduces this fact about his earlier life as an argument in favour of the complete reality of his delusions.² But any one who reads the account which follows of the character-traits of Schreber's God will have to allow that the transformation effected by the paranoid disorder was no very fundamental one, and that in the Redeemer of to-day much remains of the doubter of yesterday.

¹ A footnote on page 20 leads us to suppose that a passage in Byron's *Manfred* may have determined Schreber's choice of the names of Persian divinities. We shall later come upon further evidence of the influence of this poem on him.

² 'That it was simply a matter of illusions seems to me to be *in my case*, from the very nature of things, psychologically unthinkable. For illusions of holding communication with God or with departed souls can properly only arise in the minds of persons who, before falling into their condition of pathological nervous excitement, already have a firm belief in God and in the immortality of the soul. *This was not by any means so, however, in my case, as has been explained at the beginning of this chapter.*' (79.)

For there is a flaw in the Order of Things, as a result of which the existence of God Himself seems to be endangered. Owing to circumstances which are incapable of further explanation, the nerves of *living* men, especially when in a condition of *intense excitement*, may exercise such a powerful attraction upon the nerves of God that He cannot get free from them again, and thus His own existence may be threatened (11). This exceedingly rare occurrence took place in Schreber's case and involved him in the greatest sufferings. The instinct of self-preservation was aroused in God (30), and it then became evident that God was far removed from the perfection ascribed to him by religions. Through the whole of Schreber's book there runs the bitter complaint that God, being only accustomed to communication with the dead, *does not understand living men*.

'In this connection, however, a *fundamental misunderstanding* prevails, which has since run through my whole life like a scarlet thread. It is based precisely upon the fact that, *in accordance with the Order of Things, God really knows nothing about living men* and did not need to know; consonantly with the Order of Things, He needed only to have communication with corpses.' (55.) - 'This state of things . . . I am convinced, is once more to be brought into connection with the fact that God was, if I may so express it, quite incapable of dealing with living men, and was only accustomed to communicate with corpses, or at most with men as they lay asleep (that is, in their dreams).' (141.) - 'I myself feel inclined to exclaim: "*Incredibile scriptum!*" Yet it is all literally true, however difficult it may be for other people to grasp the idea of God's complete inability to judge living men correctly, and however long I myself took to accustom myself to this idea after my innumerable observations upon the subject.' (246.)

But as a result of God's misunderstanding of living men it was possible for Him Himself to become the instigator of the plot against Schreber, to take him for an idiot, and to subject him to these severe ordeals (264). To avoid being set down as an idiot, he submitted himself to an extremely burdensome system of 'enforced thinking'. For 'every time that my intellectual activities ceased, God jumped to the conclusion that my mental faculties were extinct and that the destruction of my understanding (the idiocy), for which He was hoping, had actually set in, and that a withdrawal had now become possible' (206).

The behaviour of God in the matter of the urge to evacuate (or 'sh--') rouses him to a specially high pitch of indignation. The passage is so characteristic that I will quote it in full. But to make it clear I must first explain that both the miracles and the voices proceed from God, that is, from the divine rays.

'Although it will necessitate my touching upon an unsavoury subject, I must devote a few more words to the question that I have just quoted ("Why don't you sh--?") on account of the typical character of the whole business. The need for evacuation, like all else that has to do with my body, is evoked by a miracle. It is brought about by my faeces being forced forwards (and sometimes backwards again) in my intestines; and if, owing to there having already been an evacuation, enough material is not present, then such small remains as there may still be of the contents of my intestines are smeared over my anal orifice. This occurrence is a miracle performed by the upper God, and it is repeated several dozens of times at the least every day. It is associated with an idea which is utterly incomprehensible to human beings and can only be accounted for by God's complete ignorance of living man as an organism. According to this idea "sh--ing" is in a certain sense the final act; that is to say, when once the urge to sh-- has been miracled up, the aim of destroying the understanding is achieved and a final withdrawal of the rays becomes possible. To get to the bottom of the origin of this idea, we must suppose, as it seems to me, that there is a misapprehension in connection with the symbolic meaning of the act of evacuation, a notion, in fact, that any one who has been in such a relation as I have with divine rays is to some extent entitled to sh-- upon the whole world.

'But now what follows reveals the full perfidy' of the policy that has been pursued towards me. Almost every time the need for evacuation was miracled up in me, some other person in my vicinity was sent (by having his nerves stimulated for that purpose) to the lavatory, in order to prevent my evacuating. This is a phenomenon which I have observed for years and upon such countless occasions - thousands of them - and with such regularity, as to exclude any possibility of its being attributable to chance. And thereupon comes the question: "Why don't you sh--?" to which the brilliant repartee is made that I am "so stupid or something". The pen well-nigh shrinks from recording so monumental a piece of absurdity as that God, blinded by His ignorance of human nature, can positively go to such lengths as to suppose that there can exist a man too stupid to do what every animal can do - too stupid to be able to sh--. When, upon the occasion of such an urge, I actually succeed in evacuating - and as a rule, since I nearly always find the lavatory engaged, I use a pail for the purpose - the process is always accompanied by the generation of an exceedingly strong feeling of spiritual voluptuousness. For the relief from the pressure caused by the presence of the faeces in the intestines produces a sense of intense well-being in the nerves of voluptuousness; and the same is equally true of making water. For this reason, even down to the present day, while I am passing stool or making water, all the rays are always without exception united; for this very reason, whenever I address myself to these natural functions, an attempt is invariably made, though as a rule in vain, to miracle backwards the urge to pass stool and to make water.'² (225-7.)

¹ In a footnote at this point the author endeavours to mitigate the harshness of the word 'perfidy' by a reference to one of his arguments in justification of God. These will be discussed presently.

² This confession to a pleasure in the excretory processes, which we have learnt to recognize as one of the auto-erotic components of infantile sexuality, may be compared with the remarks made by little Hans in my 'Analysis of a Phobia in a Five-year-old Boy'.

Furthermore, this singular God of Schreber's is incapable of learning anything by experience: 'Owing to some quality or other inherent in his nature, it seems to be impossible for God to derive any lessons for the future from the experience thus gained.' (186.) He can therefore go on repeating the same tormenting ordeals and miracles and voices, without alteration, year after year, until He inevitably becomes a laughing-stock to the victim of His persecutions.

'The consequence is that, now that the miracles have to a great extent lost the power which they formerly possessed of producing terrifying effects, God strikes me above all, in almost everything that happens to me, as being ridiculous or childish. As regards my own behaviour, this often results in my being obliged in self-defence to play the part of a scoffer at God, and even, on occasion, to scoff at Him aloud.' (333.)¹

This critical and rebellious attitude towards God is, however, opposed in Schreber's mind by an energetic counter-current, which finds expression in many places: 'But here again I must most emphatically declare that this is nothing more than an episode, which will, I hope, terminate at the latest with my decease, and that the right of scoffing at God belongs in consequence to me alone and not to other men. For them He remains the almighty creator of Heaven and earth, the first cause of all things, and the salvation of their future, to whom - notwithstanding that a few of the conventional religious ideas may require revision - worship and the deepest reverence are due.' (333-4.)

Repeated attempts are therefore made to find a justification for God's behaviour to the patient. In these attempts, which display as much ingenuity as every other theodicy, the explanation is based now upon the general nature of souls, and now upon the necessity for self-preservation under which God lay, and upon the misleading influence of the Flechsig soul (60-1 and 160). In general, however, the illness is looked upon as a struggle between Schreber the man and God, in which victory lies with the man, weak though he is, because the Order of Things is on his side (61).

The medical report might easily lead us to suppose that Schreber exhibited the everyday form of Redeemer phantasy, in which the patient believes he is the son of God, destined to save the world from its misery or from the destruction that is threatening it, and so on. It is for this reason that I have been careful to present in detail the peculiarities of Schreber's relation to God. The significance of this relation for the rest of mankind is only rarely alluded to in the *Denkwürdigkeiten* and not until the last phase of his delusional formation. It consists essentially in the fact that no one who dies can enter the state of bliss so long as the greater part of the rays of God are absorbed in his (Schreber's) person, owing to his powers of attraction (32). It is only at a very late stage, too, that his identification with Jesus Christ makes an undisguised appearance (338 and 431).

No attempt at explaining Schreber's case will have any chance of being correct which does not take into account these peculiarities in his conception of God, this mixture of reverence and rebelliousness in his attitude towards Him.

¹ Even in the basic language it occasionally happened that God was not the abuser but the abused. For instance: 'Deuce take it! What a thing to have to say - that God lets himself be f--d!' (194.)

I will now turn to another subject, which is closely related to God, namely, the *state of bliss*. This is also spoken of by Schreber as 'the life beyond' to which the human soul is raised after death by the process of purification. He describes it as a state of uninterrupted enjoyment, bound up with the contemplation of God. This is not very original, but on the other hand it is surprising to learn that Schreber makes a distinction between a male and a female state of bliss.¹ 'The male state of bliss was superior to the female, which seems to have consisted chiefly in an uninterrupted feeling of voluptuousness.' (18.) In other passages this coincidence between the state of bliss and voluptuousness is expressed in plainer language and without reference to sex-distinction; and moreover that element of the state of bliss which consists in the contemplation of God is not further discussed. Thus, for instance: 'The nature of the nerves of God, is such that the state of bliss . . . is accompanied by a very intense sensation of voluptuousness, even though it does not consist exclusively of it.' (51.) And again: 'Voluptuousness may be regarded as a fragment of the state of bliss given in advance, as it were, to men and other living creatures.' (281.) So the state of heavenly bliss is to be understood as being in its essence an intensified continuation of sensual pleasure upon earth!

This view of the state of bliss was far from being an element in Schreber's delusion that originated in the first stages of his illness and was later eliminated as being incompatible with the rest. So late as in the Statement of his Case, drawn up by the patient for the Appeal Court in July, 1901, he emphasizes as one of his greatest discoveries the fact 'that voluptuousness stands in a close relationship (not hitherto perceptible to the rest of mankind) to the state of bliss enjoyed by departed spirits'.²

¹ It would be much more in keeping with the wish-fulfilment offered by the life beyond that in it we shall at last be free from the difference between the sexes.

Und jene himmlischen Gestalten
sie fragen nicht nach Mann und Weib.

[And those calm shining sons of morn
They ask not who is maid or boy.]

² The possibility of this discovery of Schreber's having a deeper meaning is discussed below.

We shall find, indeed, that this 'close relationship' is the rock upon which the patient builds his hopes of an eventual reconciliation with God and of his sufferings being brought to an end. The rays of God abandon their hostility as soon as they are certain that in becoming absorbed into his body they will experience spiritual voluptuousness (133); God Himself demands that He shall be able to find voluptuousness in him (283), and threatens him with the withdrawal of His rays if he neglects to cultivate voluptuousness and cannot offer God what He demands (320).

This surprising sexualization of the state of heavenly bliss suggests the possibility that Schreber's concept of the state of bliss is derived from a condensation of the two principal meanings of the German word '*selig*' - namely, 'dead' and 'sensually happy'.¹ But this instance of sexualization will also give us occasion to examine the patient's general attitude to the erotic side of life and to questions of sexual indulgence. For we psycho-analysts have hitherto supported the view that the roots of every nervous and mental disorder are chiefly to be found in the patient's sexual life - some of us merely upon empirical grounds, others influenced in addition by theoretical considerations.

¹ Extreme instances of the two uses of the word are to be found in the phrase '*mein seliger Vater*' ['my late father'] and in these lines from the duet in *Don Giovanni*:

Ja, dein zu sein auf ewig,
wie selig werd' ich sein.

[Ah, to be thine for ever -
How blissful I should be!]

But the fact that the same word should be used in our language in two such different situations cannot be without significance.

The samples of Schreber's delusions that have already been given enable us without more ado to dismiss the suspicion that it might be precisely this paranoid disorder which would turn out to be the 'negative case' which has so long been sought for - a case in which sexuality plays only a very minor part. Schreber himself speaks again and again as though he shared our prejudice. He is constantly talking in the same breath of 'nervous disorder' and erotic lapses, as though the two things were inseparable.¹

Before his illness Senatspräsident Schreber had been a man of strict morals: 'Few people', he declares, and I see no reason to doubt his assertion, 'can have been brought up upon such strict moral principles as I was, and few people, all through their lives, can have exercised (especially in sexual matters) a self-restraint conforming so closely to those principles as I may say of myself that I have done.' (281.) After the severe spiritual struggle, of which the phenomena of his illness were the outward signs, his attitude towards the erotic side of life was altered. He had come to see that the cultivation of voluptuousness was incumbent upon him as a duty, and that it was only by discharging this duty that he could end the grave conflict which had broken out within him - or, as he thought, about him. Voluptuousness, so the voices assured him, had become 'God-fearing' and he could only regret that he was not able to devote himself to its cultivation the whole day long.² (285.)

¹ 'When moral corruption ("voluptuous excesses") or perhaps nervous disorder had taken a strong enough hold upon the whole population of any terrestrial body', then, thinks Schreber, bearing in mind the Biblical stories of Sodom and Gomorrah, the Deluge, etc., the world in question might come to a catastrophic end (52). - '[A rumour] sowed fear and terror among men, wrecked the foundations of religion, and spread abroad general nervous disorders and immorality, so that devastating pestilences have descended upon mankind.' (91.) - 'Thus it seems probable that by a "Prince of Hell" the souls meant the uncanny Power that was able to develop in a sense hostile to God as a result of moral depravity among men or of a general state of excessive nervous excitement following upon over-civilization.' (163.)

² In connection with his delusions he writes: '*This attraction, however, lost its terrors for the nerves in question, if, and in so far as, upon entering my body, they encountered a feeling of spiritual voluptuousness in which they themselves shared. For, if this happened, they found an equivalent or approximately equivalent substitute in my body for the state of heavenly bliss which they had lost, and which itself consisted in a kind of voluptuous enjoyment.*' (179-80.)

Such then, was the result of the changes produced in Schreber by his illness, as we find them expressed in the two main features of his delusional system. Before it he had been inclined to sexual asceticism and had been a doubter in regard to God; while after it he was a believer in God and a devotee of voluptuousness. But just as his re-conquered belief in God was of a peculiar kind, so too the sexual enjoyment which he had won for himself was of a most unusual character. It was not the sexual liberty of a man, but the sexual feelings of a woman. He took up a feminine attitude towards God; he felt that he was God's wife.¹

No other part of his delusions is treated by the patient so exhaustively, one might almost say so insistently, as his alleged transformation into a woman. The nerves absorbed by him have, so he says, assumed in his body the character of female nerves of voluptuousness, and have given to his body a more or less female stamp, and more particularly to his skin a softness peculiar to the female sex (87). If he presses lightly with his fingers upon any part of his body, he can feel these nerves, under the surface of the skin, as a tissue of a thread-like or stringy texture; they are especially present in the region of the chest, where, in a woman, her breasts would be. 'By applying pressure to this tissue, I am able to evoke a sensation of voluptuousness such as women experience, and especially in I think of something feminine at the same time.' (277.) He knows with certainty that this tissue was originally nothing else than nerves of God, which could hardly have lost the character of nerves merely through having passed over into his body (279). By means of what he calls 'drawing' (that is, by calling up visual images) he is able to give both himself and the rays an impression that his body is fitted out with female breasts and genitals: 'It has become so much a habit with me to draw female buttocks on to my body - *honi soit qui mal y pense* - that I do it almost involuntarily every time I stoop.' (233.) He is 'bold enough to assert that anyone who should happen to see me before the mirror with the upper portion of my torso bared - especially if the illusion is assisted by my wearing a little feminine finery - would receive an unmistakable impression of a *female bust*.' (280.) He calls for a medical examination, in order to establish the fact that his whole body has nerves of voluptuousness dispersed over it from head to foot, a state of things which is only to be found, in his opinion, in the female body, whereas, in the male, to the best of his knowledge, nerves of voluptuousness exist only in the sexual organs and their immediate vicinity (274). The spiritual voluptuousness which has been developed owing to this accumulation of nerves in his body is so intense that it only requires a slight effort of his imagination (especially when he is lying in bed) to procure him a feeling of sensual well-being that affords a tolerably clear adumbration of the sexual pleasure enjoyed by a woman during copulation (269).

¹ 'Something occurred in my own body similar to the conception of Jesus Christ in an immaculate virgin, that is, in a woman who had never had intercourse with a man. On two separate occasions (and while I was still in Professor Flechsig's institution) I have possessed female genitals, though somewhat imperfectly developed ones, and have felt a stirring in my body, such as would arise from the quickening of a human embryo. Nerves of God corresponding to male semen had, by a divine miracle, been projected into my body, and impregnation had thus taken place.' (Introduction, 4.)

If we now recall the dream which the patient had during the incubation period of his illness, before he had moved to Dresden, it will become clear beyond a doubt that his delusion of being transformed into a woman was nothing else than a realization of the content of that dream. At that time he had rebelled against the dream with masculine indignation, and in the same way he began by striving against its fulfilment in his illness and looked upon his transformation into a woman as a disgrace with which he was threatened with hostile intention. But there came a time (it was in November, 1895) when he began to reconcile himself to the transformation and bring it into harmony with the higher purposes of God: 'Since then, and with a full consciousness of what I did, I have inscribed upon my banner the cultivation of femaleness.' (177-8.)

He then arrived at the firm conviction that it was God Himself who, for His own satisfaction, was demanding femaleness from him:

'No sooner, however, am I alone with God (if I may so express it), than it becomes a necessity for me to employ every imaginable device and to summon up the whole of my mental faculties, and especially my imagination, in order to bring it about that the divine rays may have the impression as continuously as possible (or, since this is beyond mortal power at least at certain times of day) that I am a woman luxuriating in voluptuous sensations.' (281.)

‘On the other hand, God demands a *constant state of enjoyment*, such as would be in keeping with the conditions of existence imposed upon souls by the Order of Things; and it is my duty to provide Him with this . . . in the shape of the greatest possible generation of spiritual voluptuousness. And if, in this process, a little sensual pleasure falls to my share, I feel justified in accepting it as some slight compensation for the inordinate measure of suffering and privation that has been mine for so many past years . . .’ (283.)

‘. . . I think I may even venture to advance the view based upon impressions I have received, that God would never take any steps towards effecting a withdrawal - the first result of which is invariably to alter my physical condition markedly for the worse - but would quietly and permanently yield to my powers of attraction, if it were possible for me *always* to be playing the part of a woman lying in my own amorous embraces, *always* to be casting my looks upon female forms, *always* to be gazing at pictures of women, and so on.’ (284-5.)

In Schreber’s system the two principal elements of his delusions (his transformation into a woman and his favoured relation to God) are linked in his assumption of a feminine attitude towards God. It will be an unavoidable part of our task to show that there is an essential *genetic* relation between these two elements. Otherwise our attempts at elucidating Schreber’s delusions will leave us in the absurd position described in Kant’s famous simile in the *Critique of Pure Reason* - we shall be like a man holding a sieve under a he-goat while some one else milks it.

II

ATTEMPTS AT INTERPRETATION

There are two angles from which we could attempt to reach an understanding of this history of a case of paranoia and to lay bare in it the familiar complexes and motive forces of mental life. We might start either from the patient's own delusional utterances or from the exciting causes of his illness.

The former method must seem enticing since the brilliant example given us by Jung in his interpretation of a case of dementia praecox which was far severer than this one and which exhibited symptoms far more remote from the normal. The high level of our present patient's intelligence, too, and his communicativeness, seem likely to facilitate the accomplishment of our task along these lines. He himself not infrequently presses the key into our hands, by adding a gloss, a quotation or an example to some delusional proposition in an apparently incidental manner, or even by expressly denying some parallel to it that has arisen in his own mind. For when this happens, we have only to follow our usual psycho-analytic technique - to strip his sentence of its negative form, to take his example as being the actual thing, or his quotation or gloss as being the original source - and we find ourselves in possession of what we are looking for, namely a translation of the paranoid mode of expression into the normal one.

It is perhaps worth giving a more detailed illustration of this procedure. Schreber complains of the nuisance created by the so-called 'miracled birds' or 'talking birds', to which he ascribes a number of very remarkable qualities (208-14). It is his belief that they are composed of former 'fore-courts of Heaven', that is, of human souls which have entered into a state of bliss, and that they have been loaded with ptomaine¹ poison and set on to him. They have been brought to the condition of repeating 'meaningless phrases which they have learnt by heart' and which have been 'dinned into them'. Each time that they have discharged their load of ptomaine poison on to him - that is each time that they have 'reeled off the phrases which have been dinned into them, as it were' - they become to some extent absorbed into his soul, with the words 'The deuce of a fellow!' or 'Deuce take it!' which are the only words they are still capable of using to express a genuine feeling. They cannot understand the meaning of the words they speak, but they are by nature susceptible to similarity of sounds, though the similarity need not necessarily be a complete one. Thus it is immaterial to them whether one says:

'Santiago' or 'Karthago',
'Chinesentum' or 'Jesum Christum',
'Abendrot' or 'Atemnot',
'Ariman' or 'Ackermann' etc.² (210.)

As we read this description, we cannot avoid the idea that what it really refers to must be young girls. In a carping mood people often compare them to geese, ungallantly accuse them of having 'the brains of a bird' and declare that they can say nothing but phrases learnt by rote and they betray their lack of education by confusing foreign words that sound alike. The phrase 'The deuce of a fellow!', which is the only thing that they are serious about, would in that case be an allusion to the triumph of the young man who has succeeded in impressing them. And, sure enough, a few pages later we come upon a passage in which Schreber confirms this interpretation: 'For purposes of distinction, I have as a joke given girls' names to a great number of the remaining bird-souls; since by their inquisitiveness, their voluptuous bent, etc., they one and all most readily suggest a comparison with little girls. Some of these girls' names have since been adopted by the rays of God and have been retained as a designation of the bird-souls in question.' (214.) This easy interpretation of the 'miracled birds' gives us a hint which may help us towards understanding the enigmatic 'fore-courts of Heaven'.

¹ [German '*Leichengift*', literally 'corpse poison'.]

² ['Santiago' or 'Carthage',
'Chinese-dom' or 'Jesus Christ',
'Sunset' or 'Breathlessness',
'Ahriman' or 'Farmer'.]

I am quite aware that a psycho-analyst needs no small amount of tact and restraint whenever in the course of his work he goes beyond the typical instances of interpretation and that his listeners or readers will only follow him as far as their own familiarity with analytic technique will allow them. He has every reason, therefore, to guard against the risk that an increased display of acumen on his part may be accompanied by a diminution in the certainty and trustworthiness of his results. It is thus only natural that one analyst will tend too much in the direction of caution and another too much in the direction of boldness. It will not be possible to define the proper limits of justifiable interpretation until many experiments have been made and until the subject has become more familiar. In working upon the case of Schreber I have had a policy of restraint forced on me by the circumstance that the opposition to his publishing the *Denkwürdigkeiten* was so far effective as to withhold a considerable portion of the material from our knowledge - the portion, too, which would in all probability have thrown the most important light upon the case.¹ Thus, for instance, the third chapter of the book opens with this promising announcement: 'I shall now proceed to describe certain events which occurred to *other members of my family* and which may conceivably have been connected with the soul-murder I have postulated; for there is at any rate something more or less problematical about all of them, something not easily explicable upon the lines of ordinary human experience.' (33.) But the next sentence, which is also the last of the chapter, is as follows: 'The remainder of this chapter has been withheld from print as being unsuitable for publication.' I shall therefore have to be satisfied if I can succeed in tracing back at any rate the nucleus of the delusional structure with some degree of certainty to familiar human motives.

¹ 'When we survey the contents of this document', writes Dr. Weber in his report, 'and consider the mass of indiscretions in regard to himself and other persons which it contains, when we observe the unblushing manner in which he describes situations and events which are of the most delicate nature and indeed, in an aesthetic sense, utterly impossible, when we reflect upon his use of strong language of the most offensive kind, and so forth, we shall find it quite impossible to understand how a man, distinguished apart from this by his tact and refinement, could contemplate taking a step so compromising to himself in the public eye, unless we bear in mind the fact that . . .' etc. etc. (402.) Surely we can hardly expect that a case history which sets out to give a picture of deranged humanity and its struggles to rehabilitate itself should exhibit 'discretion' and 'aesthetic' charm.

With this object in view I shall now mention a further small piece of the case history to which sufficient weight is not given in the reports, although the patient himself has done all he can to put it in the foreground. I refer to Schreber's relations to his first physician, Geheimrat Prof. Flechsig of Leipzig.

As we already know, Schreber's case at first took the form of delusions of persecution, and did not begin to lose it until the turning-point of his illness (the time of his 'reconciliation'). From that time onwards the persecutions became less and less intolerable, and the ignominious purpose which at first underlay his threatened emasculation began to be superseded by a purpose in consonance with the Order of Things. But the first author of all these acts of persecution was Flechsig, and he remains their instigator throughout the whole course of the illness.¹

Of the actual nature of Flechsig's enormity and its motives the patient speaks with the characteristic vagueness and obscurity which may be regarded as marks of an especially intense work of delusion-formation, if it is legitimate to judge paranoia on the model of a far more familiar mental phenomenon - the dream. Flechsig, according to the patient, committed, or attempted to commit, 'soul-murder' upon him - an act which, he thought, was comparable with the effort made by the devil or by demons to gain possession of a soul and may have had its prototype in events which occurred between members of the Flechsig and Schreber families long since deceased (22 ff.). We should be glad to learn more of the meaning of this 'soul-murder', but at this point our sources relapse once more into a tendentious silence: 'As to what constitutes the true essence of soul-murder, and as to its technique, if I may so describe it, I am able to say nothing beyond what has already been indicated. There is only this, perhaps, to be added . . . (The passage which follows is unsuitable for publication.)' (28.) As a result of this omission we are left in the dark on the question of what is meant by 'soul-murder'. We shall refer later on to the only hint upon the subject which has evaded censorship.

¹ 'Even now the voices that talk with me call out your name to me hundreds of times each day. They name you in certain constantly recurring connections, and especially as being the first author of the injuries I have suffered. And yet the personal relations which existed between us for a time have, so far as I am concerned, long since faded into the background; so that I myself could have little enough reason to be for ever recalling you to my mind, and still less for doing so with any feelings of resentment.' ('Open Letter to Professor Flechsig', viii.)

However this may be, a further development of Schreber's delusions soon took place, which affected his relations to God without altering his relations to Flechsig. Hitherto he had regarded Flechsig (or rather his soul) as his only true enemy and had looked upon God Almighty as his ally; but now he could not avoid the thought that God Himself had played the part of accessory, if not of instigator, in the plot against him. (59.) Flechsig, however, remained the first seducer, to whose influence God had yielded (60). He had succeeded in making his way up to heaven with his whole soul or a part of it and in becoming a 'leader of rays', without dying or undergoing any preliminary purification.¹ (56.) The Flechsig soul continued to play this role even after the patient had been moved from the Leipzig clinic to Dr. Pierson's asylum. The influence of the new environment was shown by the Flechsig soul being joined by the soul of the chief attendant, whom the patient recognized as a person who had formerly lived in the same block of flats as himself. This was represented as being the von W. soul.² The Flechsig soul then introduced the system of 'soul-division', which assumed large proportions. At one time there were as many as forty to sixty sub-divisions of the Flechsig soul; two of its larger divisions were known as the 'upper Flechsig' and the 'middle Flechsig'. The von W. soul (the chief attendant's) behaved in just the same fashion (111). It was sometimes most entertaining to notice the way in which these two souls, in spite of their alliance, carried on a feud with one another, the aristocratic pride of the one pitted against the professorial vanity of the other (113). During his first weeks at Sonnenstein (to which he was finally moved in the summer of 1894) the soul of his new physician, Dr. Weber, came into play; and shortly afterwards the change-over took place in the development of his delusions which we have come to know as his 'reconciliation'.

¹ According to another and significant version, which, however, was soon rejected, Professor Flechsig had shot himself either at Weissenburg in Alsace or in a police cell at Leipzig. The patient saw his funeral go past, though not in the direction that was to be expected in view of the relative positions of the University Clinic and the cemetery. On other occasions Flechsig appeared to him in the company of a policeman, or in conversation with his wife. Schreber was a witness of this conversation by the method of 'nerve-connection', and in the course of it Professor Flechsig called himself 'God Flechsig' to his wife, so that she was inclined to think he had gone mad. (82.)

² The voices informed him that in the course of an official enquiry this von W. had made some untrue statements about him, either deliberately or out of carelessness, and in particular had accused him of masturbation. As a punishment for this he was now obliged to wait on the patient (108).

During this later stay at Sonnenstein, when God had begun to appreciate him better, a raid was made upon the souls, which had been multiplied so much as to become a nuisance. As a result of this, the Flechsig soul survived in only one or two shapes, and the von W. soul in only a single one. The latter soon disappeared altogether. The divisions of the Flechsig soul, which slowly lost both their intelligence and their power, then came to be described as the 'posterior Flechsig' and the "'Oh well!" Party'. That the Flechsig soul retained its importance to the last, is made clear by Schreber's prefatory 'Open Letter to Herr Geheimrat Prof. Dr. Flechsig'.

In this remarkable document Schreber expresses his firm conviction that the physician who influenced him had the same visions and received the same disclosures upon supernatural things as he himself. He protests on the very first page that the author of the *Denkwürdigkeiten* has not the remotest intention of making an attack upon the doctor's honour, and the same point is earnestly and emphatically repeated in the patient's presentations of his position (343, 445). It is evident that he is endeavouring to distinguish the 'soul Flechsig' from the living man of the same name, the Flechsig of his delusions from the real Flechsig.¹

¹ 'I am accordingly obliged *to admit as a possibility* that everything in the first chapters of my *Denkwürdigkeiten* which is connected with the name of Flechsig may only refer to the soul Flechsig as distinguished from the living man. For that his soul has a separate existence is a certain fact, though it cannot be explained upon any natural basis.' (342-3.)

The study of a number of cases of delusions of persecution has led me as well as other investigators to the view that the relation between the patient and his persecutor can be reduced to a simple formula.¹ It appears that the person to whom the delusion ascribes so much power and influence, in whose hands all the threads of the conspiracy converge, is, if he is definitely named, either identical with some one who played an equally important part in the patient's emotional life before his illness, or is easily recognizable as a substitute for him. The intensity of the emotion is projected in the shape of external power, while its quality is changed into the opposite. The person who is now hated and feared for being a persecutor was at one time loved and honoured. The main purpose of the persecution asserted by the patient's delusion is to justify the change in his emotional attitude.

Bearing this point of view in mind, let us now examine the relations which had formerly existed between Schreber and his physician and persecutor, Flechsig. We have already heard that, in the years 1884 and 1885, Schreber suffered from a first attack of nervous disorder, which ran its course 'without the occurrence of any incidents bordering upon the sphere of the supernatural' (35). While he was in this condition, which was described as 'hypochondria' and seems not to have overstepped the limits of a neurosis, Flechsig acted as his doctor. At that time Schreber spent six months in the University Clinic at Leipzig. We learn that after his recovery he had cordial feelings towards his doctor. 'The main thing was that, after a fairly long period of convalescence which I spent in travelling, I was finally cured; and it was therefore impossible that I should feel anything at that time but the liveliest gratitude towards Professor Flechsig. I gave a marked expression to this feeling both in a personal visit which I subsequently paid him and in what I deemed to be an appropriate honorarium.' (35-6.) It is true that Schreber's encomium in the *Denkwürdigkeiten* upon this first treatment of Flechsig's is not entirely without reservations; but that can easily be understood if we consider that his attitude had in the meantime been reversed. The passage immediately following the one that has just been quoted bears witness to the original warmth of his feelings towards the physician who had treated him so successfully: 'The gratitude of my wife was perhaps even more heartfelt; for she revered Professor Flechsig as the man who had restored her husband to her, and hence it was that for years she kept his portrait standing upon her writing-table.' (36.)

¹ Cf. Abraham, 1908. In the course of this paper its author, referring to a correspondence between us, scrupulously attributes to myself an influence upon the development of his views.

Since we cannot obtain any insight into the causes of the first illness (a knowledge of which is undoubtedly indispensable for properly elucidating the second and severer illness) we must now plunge at random into an unknown concatenation of circumstances. During the incubation period of his illness, as we are aware (that is, between June 1893, when he was appointed to his new post, and the following October, when he took up his duties), he repeatedly dreamt that his old nervous disorder had returned. Once, moreover, when he was half asleep, he had a feeling that after all it must be nice to be a woman submitting to the act of copulation. The dreams and the phantasy are reported by Schreber in immediate succession; and if we also bring together their subject-matter, we shall be able to infer that, at the same time as his recollection of his illness, a recollection of his doctor was also aroused in his mind, and that the feminine attitude which he assumed in the phantasy was from the first directed towards the doctor. Or it may be that the dream of his illness having returned simply expressed some such longing as: 'I wish I could see Flechsig again!' Our ignorance of the mental content of the first illness bars our way in this direction. Perhaps that illness had left behind in him a feeling of affectionate dependence upon his doctor, which had now, for some unknown reason, become intensified to the pitch of an erotic desire. This feminine phantasy which was still kept impersonal, was met at once by an indignant repudiation - a true 'masculine protest', to use Adler's expression, but in a sense different from his.¹ But in the severe psychosis which broke out soon afterwards the feminine phantasy carried everything before it; and it only requires a slight correction of the characteristic paranoid indefiniteness of Schreber's mode of expression to enable us to divine the fact that the patient was in fear of sexual abuse at the hands of his doctor himself. The exciting cause of his illness, then, was an outburst of homosexual libido; the object of this libido was probably from the very first his doctor, Flechsig; and his struggles against the libidinal impulse produced the conflict which gave rise to the symptoms.

¹ Adler (1910). According to Adler the masculine protest has a share in the production of the symptom, whereas in the present instance the patient is protesting against a symptom that is already fully fledged.

I will pause here for a moment to meet a storm of remonstrances and objections. Any one acquainted with the present state of psychiatry must be prepared to face trouble.

'Is it not an act of irresponsible levity, an indiscretion and a calumny, to charge a man of such high ethical standing as the former Senatspräsident Schreber with homosexuality?' - No. The patient has himself informed the world at large of his phantasy of being transformed into a woman, and he has allowed all personal considerations to be outweighed by interests of a higher nature. Thus he has himself given us the right to occupy ourselves with his phantasy, and in translating it into the technical terminology of medicine we have not made the slightest addition to its content.

'Yes, but he was not in his right mind when he did it. His delusion that he was being transformed into a woman was a pathological idea.' - We have not forgotten that. Indeed our only concern is with the meaning and origin of this pathological idea. We will appeal to the distinction he himself draws between the man Flechsig and the 'Flechsig soul'. We are not making reproaches of any kind against him - whether for having had homosexual impulses or for having endeavoured to suppress them. Psychiatrists should at last take a lesson from this patient, when they see him trying, in spite of his delusions, not to confuse the world of the unconscious with the world of reality.

'But it is nowhere expressly stated that the transformation into a woman which he so much dreaded was to be carried out for the benefit of Flechsig.' - That is true; and it is not difficult to understand why, in preparing his memoirs for publication, since he was anxious not to insult the 'man Flechsig', he should have avoided so gross an accusation. But the toning-down of his language owing to these considerations did not go so far as to be able to conceal the true meaning of his accusation. Indeed, it may be maintained that after all it is expressed openly in such a passage as the following: 'In this way a conspiracy against me was brought to a head (in about March or April, 1894). Its object was to contrive that, when once my nervous complaint had been recognized as incurable or assumed to be so, *I should be handed over to a certain person* in such a manner that my soul should be delivered up to him, but my body . . . should be transformed into a female body, and *as such surrendered to the person in question* with a view to sexual abuse . . .'¹ (56). It is unnecessary to remark that no other individual is ever named who could be put in Flechsig's place. Towards the end of Schreber's stay in the clinic at Leipzig, a fear occurred to his mind that he 'was to be thrown to the attendants' for the purpose of sexual abuse (98). Any remaining doubts that we have upon the nature of the part originally attributed to the doctor are dispelled when, in the later stages of his delusion, we find Schreber outspokenly admitting his feminine attitude towards God. The other accusation against Flechsig echoes over-loudly through the book. Flechsig, he says, tried to commit soul-murder upon him. As we already know, the patient was himself not clear as to the actual nature of that crime, but it was connected with matters of discretion which precluded their publication (as we see from the suppressed third chapter). From this point a single thread takes us further. Schreber illustrates the nature of soul-murder by referring to the legends embodied in Goethe's *Faust*, Byron's *Manfred*, Weber's *Freischütz*, etc. (22), and one of these instances is further cited in another passage. In discussing the division of God into two persons, Schreber identifies his 'lower God' and 'upper God' with Ahriman and Ormuzd respectively (19); and a little later a casual footnote occurs: 'Moreover, the name of Ahriman also appears in connection with a soul-murder in, for example, Lord Byron's *Manfred*.' (20.) In the play which is thus referred to there is scarcely anything comparable to the bartering of Faust's soul, and I have searched it in vain for the expression 'soul-murder'. But the essence and the secret of the whole work lies in - an incestuous relation between a brother and a sister. And here our thread breaks off short.²

¹ The italics in this passage are mine.

² By way of substantiating the above assertion I will quote a passage from the last scene of the play, in which Manfred says to the demon who has come to fetch him away:

. . . my past power
Was purchased by no compact with thy crew.

There is thus a direct contradiction of a soul having been bartered. This mistake on Schreber's part was probably not without its significance. - It is plausible, by the way, to connect the plot of *Manfred* with the incestuous relations which have repeatedly been asserted to exist between the poet and his half-sister. And it is not a little striking that the action of Byron's other play, his celebrated *Cain*, should be laid in the primal family, where no objections could exist to incest between brother and sister. - Finally, we cannot leave the subject of soul-murder without quoting one more passage from the *Denkwürdigkeiten*: 'in this connection Flechsig used formerly to be named as the first author of soul-murder, whereas for some time past the facts have been deliberately inverted and an attempt has been made to "represent" myself as being the one who practises soul-murder . . .'³ (23.)

At a later stage in this paper I intend to return to a discussion of some further objections; but in the meantime I shall consider myself justified in maintaining the view that the basis of Schreber's illness was the outburst of a homosexual impulse. This hypothesis harmonizes with a noteworthy detail of the case history, which remains otherwise inexplicable. The patient had a fresh 'nervous collapse', which exercised a decisive effect upon the course of his illness, at a time when his wife was taking a short holiday on account of her own health. Up till then she had spent several hours with him every day and had taken her mid-day meal with him. But when she returned after an absence of four days, she found him most sadly altered: so much so, indeed, that he himself no longer wished to see her. 'What especially determined my mental break-down was a particular night, during which I had a quite extraordinary number of emissions - quite half a dozen, all in that one night.' (44.) It is easy to understand that the mere presence of his wife must have acted as a protection against the attractive power of the men about him; and if we are prepared to admit that an emission cannot occur in an adult without some mental concomitant, we shall be able to supplement the patient's emissions that night by assuming that they were accompanied by homosexual phantasies which remained unconscious.

The question of why this outburst of homosexual libido overtook the patient precisely at this period (that is, between the dates of his appointment and of his move to Dresden) cannot be answered in the absence of more precise knowledge of the story of his life. Generally speaking, every human being oscillates all through his life between heterosexual and homosexual feelings, and any frustration or disappointment in the one direction is apt to drive him over into the other. We know nothing of these factors in Schreber's case, but we must not omit to draw attention to a somatic factor which may very well have been relevant. At the time of this illness Dr. Schreber was fifty-one years old, and he had therefore reached an age which is of critical importance in sexual life. It is a period at which in women the sexual function, after a phase of intensified activity, enters upon a process of far-reaching involution; nor do men appear to be exempt from its influence, for men as well as women are subject to a 'climacteric' and to the susceptibilities to disease which go along with it.¹

¹ I owe my knowledge of Schreber's age at the time of his illness to some information which was kindly given me by one of his relatives, through the agency of Dr. Stegmann of Dresden. Apart from this one fact, however, I have made use of no material in this paper that is not derived from the actual text of the *Denkwürdigkeiten*.

I can well imagine what a dubious hypothesis it must appear to be to suppose that a man's friendly feeling towards his doctor can suddenly break out in an intensified form after a lapse of eight years¹ and become the occasion of such a severe mental disorder. But I do not think we should be justified in dismissing such a hypothesis merely on account of its inherent improbability, if it recommends itself to us on other grounds; we ought rather to inquire how far we shall get if we follow it up. For the improbability may be of a passing kind and may be due to the fact that the doubtful hypothesis has not as yet been brought into relation with any other pieces of knowledge and that it is the first hypothesis with which the problem has been approached. But for the benefit of those who are unable to hold their judgement in suspense and who regard our hypothesis as altogether untenable, it is easy to suggest a possibility which would rob it of its bewildering character. The patient's friendly feeling towards his doctor may very well have been due to a process of 'transference', by means of which an emotional cathexis became transposed from some person who was important to him on to the doctor who was in reality indifferent to him; so that the doctor will have been chosen as a deputy or surrogate for some one much closer to him. To put the matter in a more concrete form: the patient was reminded of his brother or father by the figure of the doctor, he rediscovered them in him; there will then be nothing to wonder at if, in certain circumstances, a longing for the surrogate figure reappeared in him and operated with a violence that is only to be explained in the light of its origin and primary significance.

With a view to following up this attempt at an explanation, I naturally thought it worth while discovering whether the patient's father was still alive at the time at which he fell ill, whether he had had a brother, and if so whether he was then living or among the 'blest'. I was pleased, therefore, when, after a prolonged search through the pages of the *Denkwürdigkeiten*, I came at last upon a passage in which the patient sets these doubts at rest: 'The memory of my father and my brother . . . is as sacred to me as . . .' etc. (442.) So that both of them were dead at the time of the onset of his second illness (and, it may be, of his first illness as well).

We shall therefore, I think, raise no further objections to the hypothesis that the exciting cause of the illness was the appearance in him of a feminine (that is, a passive homosexual) wishful phantasy, which took as its object the figure of his doctor. An intense resistance to this phantasy arose on the part of Schreber's personality, and the ensuing defensive struggle, which might perhaps just as well have assumed some other shape, took on, for reasons unknown to us, that of a delusion of persecution. The person he longed for now became his persecutor, and the content of his wishful phantasy became the content of his persecution. It may be presumed that the same schematic outline will turn out to be applicable to other cases of delusions of persecution. What distinguishes Schreber's case from others, however, is its further development and the transformation it underwent in the course of it.

¹ This was the length of the interval between Schreber's first and second illnesses.

One such change was the replacement of Flechsig by the superior figure of God. This seems at first as though it were a sign of aggravation of the conflict, an intensification of the unbearable persecution, but it soon becomes evident that it was preparing the way for the second change and, with it, the solution of the conflict. It was impossible for Schreber to become reconciled to playing the part of a female wanton towards his doctor; but the task of providing God Himself with the voluptuous sensations that He required called up no such resistance on the part of his ego. Emasculation was now no longer a disgrace; it became 'consonant with the Order of Things', it took its place in a great cosmic chain of events, and was instrumental in the re-creation of humanity after its extinction. 'A new race of men, born from the spirit of Schreber' would, so he thought, revere as their ancestor this man who believed himself the victim of persecution. By this means an outlet was provided which would satisfy both of the contending forces. His ego found compensation in his megalomania, while his feminine wishful phantasy made its way through and became acceptable. The struggle and the illness could cease. The patient's sense of reality, however, which had in the meantime become stronger, compelled him to postpone the solution from the present to the remote future, and to content himself with what might be described as an asymptotic wish-fulfilment.¹ Some time or other, he anticipated, his transformation into a woman would come about; until then the personality of Dr. Schreber would remain indestructible.

In textbooks of psychiatry we frequently come across statements to the effect that megalomania can develop out of delusions of persecution. The process is supposed to be as follows. The patient is primarily the victim of a delusion that he is being persecuted by powers of the greatest might. He then feels a need to account to himself for this, and in that way hits on the idea that he himself is a very exalted personage and worthy of such persecution. The development of megalomania is thus attributed by the textbooks to a process which (borrowing a useful word from Ernest Jones) we may describe as 'rationalization'. But to ascribe such important affective consequences to a rationalization is, as it seems to us, an entirely unpsychological proceeding; and we would consequently draw a sharp distinction between our opinion and the one which we have quoted from the textbooks. We are making no claim, for the moment, to knowing the origin of the megalomania.

¹ 'It is only, he writes towards the end of the book, 'as possibilities which must be taken into account, that I mention that my emasculation may even yet be accomplished and may result in a new generation issuing from my womb by divine impregnation.' (293.)

Turning once more to the case of Schreber, we are bound to admit that any attempt at throwing light upon the transformation in his delusion brings us up against extraordinary difficulties. In what manner and by what means was the ascent from Flechsig to God brought about? From what source did he derive the megalomania which so fortunately enabled him to become reconciled to his persecution, or, in analytical phraseology, to accept the wishful phantasy which had had to be repressed? The *Denkwürdigkeiten* give us a first clue; for they show us that in the patient's mind 'Flechsig' and 'God' belonged to the same class. In one of his phantasies he overheard a conversation between Flechsig and his wife, in which the former asserted that he was 'God Flechsig', so that his wife thought he had gone mad (82). But there is another feature in the development of Schreber's delusions which claims our attention. If we take a survey of the delusions as a whole we see that the persecutor is divided into Flechsig and God; in just the same way Flechsig himself subsequently splits up into two personalities, the 'upper' and the 'middle' Flechsig, and God into the 'lower' and the 'upper' God. In the later stages of the illness the decomposition of Flechsig goes further still (193). A process of decomposition of this kind is very characteristic of paranoia. Paranoia decomposes just as hysteria condenses. Or rather, paranoia resolves once more into their elements the products of the condensations and identifications which are effected in the unconscious. The frequent repetition of the decomposing process in Schreber's case would, according to Jung, be an expression of the importance which the person in question possessed for him.¹ All of this dividing up of Flechsig and God into a number of persons thus had the same meaning as the splitting of the persecutor into Flechsig and God. They were all duplications of one and the same important relationship.² But, in order to interpret all these details, we must further draw attention to our view of this decomposition of the persecutor into Flechsig and God as a paranoid reaction to a previously established identification of the two figures or their belonging to the same class. If the persecutor Flechsig was originally a person whom Schreber loved, then God must also simply be the reappearance of some one else whom he loved, and probably some one of greater importance.

¹ Jung (1910a). Jung is probably right when he goes on to say that the decomposition follows the general lines taken by schizophrenia in that it uses a process of analysis in order to produce a watering-down effect, and is thus designed to prevent the occurrence of unduly powerful impressions. When, however, one of his patients said to him: 'Oh, are you Dr. J. too? There was some one here this morning who said he was Dr. J.', we must interpret it as being an admission to this effect: 'You remind me now of a different member of the class of my transferences from the one you reminded me of when you visited me last.'

² Otto Rank (1909) has found the same process at work in the formation of myths.

If we pursue this train of thought, which seems to be a legitimate one, we shall be driven to the conclusion that the other person must have been his father; this makes it all the clearer that Flechsig must have stood for his brother - who, let us hope, may have been older than himself.¹ The feminine phantasy, which aroused such violent opposition in the patient, thus had its root in a longing, intensified to an erotic pitch, for his father and brother. This feeling, so far as it referred to his brother, passed, by a process of transference, on to his doctor, Flechsig; and when it was carried back on to his father a settlement of the conflict was reached.

We shall not feel that we have been justified in thus introducing Schreber's father into his delusions, unless the new hypothesis shows itself of some use to us in understanding the case and in elucidating details of the delusions which are as yet unintelligible. It will be recalled that Schreber's God and his relations to Him exhibited the most curious features: how they showed the strangest mixture of blasphemous criticism and mutinous insubordination on the one hand and of reverent devotion on the other. God, according to him, had succumbed to the misleading influence of Flechsig: He was incapable of learning anything by experience, and did not understand living men because He only knew how to deal with corpses; and He manifested His power in a succession of miracles which, striking though they might be, were none the less futile and silly.

¹ No information on this point is to be found in the *Denkwürdigkeiten*.

Now the father of Senatspräsident Dr. Schreber was no insignificant person. He was the Dr. Daniel Gottlob Moritz Schreber whose memory is kept green to this day by the numerous Schreber Associations which flourish especially in Saxony; and, moreover, he was a *physician*. His activities in favour of promoting the harmonious upbringing of the young, of securing co-ordination between education in the home and in the school, of introducing physical culture and manual work with a view to raising the standards of health - all this exerted a lasting influence upon his contemporaries.¹ His great reputation as the founder of therapeutic gymnastics in Germany is still shown by the wide circulation of his *Ärztliche Zimmergymnastik* in medical circles and the numerous editions through which it has passed.

Such a father as this was by no means unsuitable for transfiguration into a God in the affectionate memory of the son from whom he had been so early separated by death. It is true that we cannot help feeling that there is an impassable gulf between the personality of God and that of any human being, however eminent he may be. But we must remember that this has not always been so. The gods of the peoples of antiquity stood in a closer human relationship to them. The Romans used to deify their dead emperors as a matter of routine; and the Emperor Vespasian, a sensible and competent man, exclaimed when he was first taken ill: 'Alas! Methinks I am becoming a God!'²

¹ I have to thank my colleague Dr. Stegmann of Dresden for his kindness in letting me see a copy of a journal entitled *Der Freund der Schreber-Vereine* [*The Friend of the Schreber Associations*]. This number (Vol. II. No. 10) celebrates the centenary of Dr. Schreber's birth, and some biographical data are contained in it. Dr. Schreber senior was born in 1808 and died in 1861, at the age of only fifty-three. From the source which I have already mentioned I know that our patient was at that time nineteen years old.

² Suetonius, *Lives of the Caesars*, Book VIII, Chapter 23. This practice of deification began with Julius Caesar. Augustus styled himself '*Divi filius*' ['the son of the God'] in his inscriptions.

We are perfectly familiar with the infantile attitude of boys towards their father; it is composed of the same mixture of reverent submission and mutinous insubordination that we have found in Schreber's relation to his God, and is the unmistakable prototype of that relation, which is faithfully copied from it. But the circumstance that Schreber's father was a physician, and a most eminent physician, and one who was no doubt highly respected by his patients, is what explains the most striking characteristics of his God and those upon which he dwells in such a critical fashion. Could more bitter scorn be shown for such a physician than by declaring that he understands nothing about living men and only knows how to deal with corpses? No doubt it is an essential attribute of God to perform miracles; but a physician performs miracles too; he effects miraculous cures, as his enthusiastic clients proclaim. So that when we see that these very miracles (the material for which was provided by the patient's hypochondria) turn out to be incredible, absurd, and to some extent positively silly, we are reminded of the assertion in my *Interpretation of Dreams* that absurdity in dreams expresses ridicule and derision.¹ Evidently, therefore, it is used for the same purposes in paranoia. As regards some of the other reproaches which he levelled against God, such, for instance, as that He learned nothing by experience, it is natural to suppose that they are examples of the *tu quoque* mechanism used by children,² which, when they receive a reproof, flings it back unchanged upon the person who originated it. Similarly, the voices give us grounds for suspecting that the accusation of soul-murder brought against Flechsig was in the first instance a self-accusation.³

¹ p. 891.

² It looks remarkably like a *revanche* of this sort when we find the patient writing out the following memorandum one day: '*Any attempt at exercising an educative influence must be abandoned as hopeless.*' (188.) The uneducable one was God.

³ 'Whereas for some time past the facts have been deliberately inverted and an attempt has been made to "represent" myself as being the one who practises soul-murder . . .' etc. (23).

Emboldened by the discovery that his father's profession helps to explain the peculiarities of Schreber's God, we shall now venture upon an interpretation which may throw some light upon the remarkable structure of that Being. The heavenly world consisted, as we know, of the 'anterior realms of God' which were also called the 'fore-courts of Heaven' and which contained the souls of the dead, and of the 'lower' and the 'upper' God, who together constituted the 'posterior realms of God' (19). Although we must be prepared to find that there is a condensation here which we shall not be able to resolve, it is nevertheless worth while referring to a clue that is already in our hands. If the 'miracled' birds, which have been shown to be girls, were originally fore-courts of Heaven, may it not be that the *anterior* realms of God and the fore-courts¹ of Heaven are to be regarded as a symbol of what is female, and the *posterior* realms of God as a symbol of what is male? If we knew for certain that Schreber's dead brother was older than himself, we might suppose that the decomposition of God into the lower and the upper God gave expression to the patient's recollection that after his father's early death his elder brother had stepped into his place.

In this connection, finally, I should like to draw attention to the subject of the *sun*, which, through its 'rays', came to have so much importance in the expression of his delusions. Schreber has a quite peculiar relation to the sun. It speaks to him in human language, and thus reveals itself to him as a living being, or as the organ of a yet higher being lying behind it (9). We learn from a medical report that at one time he 'used to shout threats and abuse at it and positively bellow at it' (382)² and used to call out to it that it must crawl away from him and hide. He himself tells us that the sun turns pale before him.³ The manner in which it is bound up with his fate is shown by the important alterations it undergoes as soon as changes begin to occur in him, as, for instance, during his first weeks at Sonnenstein (135). Schreber makes it easy for us to interpret this solar myth of his. He identifies the sun directly with God, sometimes with the lower God (Ahriman),⁴ and sometimes with the upper. 'On the following day . . . I saw the upper God (Ormuzd), and this time not with my spiritual eyes but with my bodily ones. It was the sun, but not the sun in its ordinary aspect, as it is known to all men; it was . . .' etc. (137-8.) It is therefore no more than consistent of him to treat it in the same way as he treats God Himself.

¹ [The German word '*Vorhof*' besides having the literal meaning of 'fore-court', is used in anatomy as a synonym for the 'vestibulum', a region of the female genitals.]

² 'The sun is a whore', he used to exclaim (384).

³ 'To some extent, moreover, even to this day the sun presents a different picture to my eyes from what it did before my illness. When I stand facing it and speak aloud, its rays turn pale before me. I can gaze at it without any difficulty and without being more than slightly dazzled by it; whereas in my healthy days it would have been as impossible for me as for anyone else to gaze at it for a minute at a time.' (139, footnote.)

⁴ 'Since July, 1894, the voices that talk to me have identified him directly with the sun.' (88.)

The sun, therefore, is nothing but another sublimated symbol for the father; and in pointing this out I must disclaim all responsibility for the monotony of the solutions provided by psycho-analysis. In this instance symbolism overrides grammatical gender - at least so far as German goes,¹ for in most other languages the sun is masculine. Its counterpart in this picture of the two parents is 'Mother Earth' as she is generally called. We frequently come upon confirmations of this assertion in resolving the pathogenic phantasies of neurotics by psycho-analysis. I can make no more than the barest allusion to the relation of all this to cosmic myths. One of my patients, who had lost his father at a very early age, was always seeking to rediscover him in what was grand and sublime in Nature. Since I have known this, it has seemed to me probable that Nietzsche's hymn 'Vor Sonnenaufgang' ['Before Sunrise'] is an expression of the same longing.² Another patient, who became neurotic after his father's death, was seized with his first attack of anxiety and giddiness while the sun shone upon him as he was working in the garden with a spade. He spontaneously put forward as an interpretation that he had become frightened because his father had looked at him while he was at work upon his mother with a sharp instrument. When I ventured upon a mild remonstrance, he gave an air of greater plausibility to his view by telling me that even in his father's lifetime he had compared him with the sun, though then it had been in a satirical sense. Whenever he had been asked where his father was going to spend the summer he had replied in these sonorous words from the 'Prologue in Heaven':

Und seine vorgeschrieb'ne Reise
Vollendet er mit Donnergang.³

His father, acting on medical advice, had been in the habit of paying an annual visit to Marienbad. This patient's infantile attitude towards his father took effect in two successive phases. As long as his father was alive it showed itself in unmitigated rebelliousness and open discord, but immediately after his death it took the form of a neurosis based upon abject submission and deferred obedience to him.

¹ [The German word for 'sun' is feminine: '*die Sonne*'.]

² Also *Sprach Zarathustra*, Part III. It was only as a child that Nietzsche too knew his father.

³ ['And with a tread of thunder he accomplishes his prescribed journey.']

Thus in the case of Schreber we find ourselves once again on the familiar ground of the father-complex.¹ The patient's struggle with Flechsig became revealed to him as a conflict with God, and we must therefore construe it as an infantile conflict with the father whom he loved; the details of that conflict (of which we know nothing) are what determined the content of his delusions. None of the material which in other cases of the sort is brought to light by analysis is absent in the present one: every element is hinted at in one way or another. In infantile experiences such as this the father appears as an interferer with the satisfaction which the child is trying to obtain; this is usually of an auto-erotic character, though at a later date it is often replaced in phantasy by some other satisfaction of a less inglorious kind.² In the final stage of Schreber's delusion a magnificent victory was scored by the infantile sexual urge; for voluptuousness became God-fearing, and God Himself (his father) never tired of demanding it from him. His father's most dreaded threat, castration, actually provided the material for his wishful phantasy (at first resisted but later accepted) of being transformed into a woman. His allusion to an offence covered by the surrogate idea 'soul-murder' could not be more transparent. The chief attendant was discovered to be identical with his neighbour von W., who, according to the voices, had falsely accused him of masturbation (108). The voices said, as though giving grounds for the threat of castration: 'For you are to be *represented* as being given over to voluptuous excesses.'³ (127-8.) Finally, we come to the enforced thinking (47) to which the patient submitted himself because he supposed that God would believe he had become an idiot and would withdraw from him if he ceased thinking for a moment. This is a reaction (with which we are also familiar in other connections) to the threat or fear of losing one's reason⁴ as a result of indulging in sexual practices and especially in masturbation. Considering the enormous number of delusional ideas of a hypochondriacal nature⁵ which the patient developed, no great importance should perhaps be attached to the fact that some of them coincide word for word with the hypochondriacal fears of masturbators.⁶

¹ In the same way, Schreber's 'feminine wishful phantasy' is simply one of the typical forms taken by the infantile nuclear complex.

² See some remarks on this subject in my analysis of the 'Rat Man'.

³ The systems of 'representing' and of 'noting down' (126), taken in conjunction with the 'proved souls', point back to experiences in the patient's school days.

⁴ 'This was the end in view, as was frankly admitted at an earlier date in the phrase "We want to destroy your reason", which I have heard proceeding from the upper God upon countless occasions.' (206 *n.*)

⁵ I must not omit to remark at this point that I shall not consider any theory of paranoia trustworthy unless it also covers the *hypochondriacal* symptoms by which that disorder is almost invariably accompanied. It seems to me that hypochondria stands in the same relation to paranoia as anxiety neurosis does to hysteria.

⁶ 'For this reason attempts were made to pump out my spinal cord. This was done by means of so-called "little men" who were placed in my feet. I shall have more to say presently on the subject of these "little men", who showed some resemblance to the phenomena of the same name which I have already discussed in Chapter VI. There used as a rule to be two of them - a "little Flechsig" and a "little von W." - And I used to hear their voices, too, in my feet.' (154.) Von W. was the man who was supposed to have accused Schreber of masturbation. The 'little men' are described by Schreber himself as being among the most remarkable and, in some respects, the most puzzling phenomena of his illness (157). It looks as though they were the product of a condensation of children and - spermatozoa.

Any one who was more daring than I am in making interpretations, or who was in touch with Schreber's family and consequently better acquainted with the society in which he moved and the small events of his life, would find it an easy matter to trace back innumerable details of his delusions to their sources and so discover their meaning, and this in spite of the censorship to which the *Denkwürdigkeiten* have been subjected. But as it is, we must necessarily content ourselves with this shadowy sketch of the infantile material which was used by the paranoid disorder in portraying the current conflict.

Perhaps I may be allowed to add a few words with a view to establishing the causes of this conflict that broke out in relation to the feminine wishful phantasy. As we know, when a wishful phantasy makes its appearance, our business is to bring it into connection with some *frustration*, some privation in real life. Now Schreber admits having suffered a privation of the kind. His marriage, which he describes as being in other respects a happy one, brought him no children; and in particular it brought him no son who might have consoled him for the loss of his father and brother and upon whom he might have drained off his unsatisfied homosexual affections.¹ His family line threatened to die out, and it seems that he felt no little pride in his birth and lineage. 'Both the Flechsigs and the Schrebers were members of "the highest nobility of Heaven", as the phrase went. The Schrebers in particular bore the title of "Margraves of Tuscany and Tasmania"; for souls, urged by some sort of personal vanity, have a custom of adorning themselves with somewhat high-sounding titles borrowed from this world.'² (24.) The great Napoleon obtained a divorce from Josephine (though only after severe internal struggles) because she could not propagate the dynasty.³ Dr. Schreber may have formed a phantasy that if he were a woman he would manage the business of having children more successfully; and he may thus have found his way back into the feminine attitude towards his father which he had exhibited in the earliest years of his childhood. If that were so, then his delusion that as a result of his emasculation the world was to be peopled with 'a new race of men, born from the spirit of Schreber' (288) - a delusion the realization of which he was continually postponing to a more and more remote future - would also be designed to offer him an escape from his childlessness. If the 'little men' whom Schreber himself finds so puzzling were children, then we should have no difficulty in understanding why they were collected in such great numbers on his head (158): they were in truth the 'children of his spirit'.⁴

¹ 'After my recovery from my first illness I spent eight years with my wife - years, upon the whole, of great happiness, rich in outward honours, and only clouded from time to time by the oft-repeated disappointment of our hope that we might be blessed with children.' (36).

² He goes on from this remark, which preserves in his delusions the good-natured irony of his saner days, to trace back through former centuries the relations between the Flechsig and Schreber families. In just the same way a young man who is newly engaged, and cannot understand how he can have lived so many years without knowing the girl he is now in love with, will insist that he really made her acquaintance at some earlier time.

³ In this connection it is worth mentioning a protest entered by the patient against some statements made in the medical report: 'I have never trifled with the idea of obtaining a *divorce*, nor have I displayed any indifference to the maintenance of our marriage tie, such as might be inferred from the expression used in the report to the effect that "I am always ready with the rejoinder that my wife can get a divorce if she likes".' (436.)

⁴ Cf. what I have said about the method of representing patrilineal descent and about the birth of Athena in my analysis of the 'Rat Man' (1909d), [p. 2183 n.](#)

III

ON THE MECHANISM OF PARANOIA

We have hitherto been dealing with the father-complex, which was the dominant element in Schreber's case and with the wishful phantasy round which the illness centred. But in all of this there is nothing characteristic of the form of disease known as paranoia, nothing that might not be found (and that has not in fact been found) in other kinds of neuroses. The distinctive character of paranoia (or of dementia paranoides) must be sought for elsewhere - namely, in the particular form assumed by the symptoms; and we shall expect to find that this is determined, not by the nature of the complexes themselves, but by the mechanism by which the symptoms are formed or by which repression is brought about. We should be inclined to say that what was characteristically paranoid about the illness was the fact that the patient, as a means of warding off a homosexual wishful phantasy, reacted precisely with delusions of persecution of this kind.

These considerations therefore lend an added weight to the circumstance that we are in point of fact driven by experience to attribute to homosexual wishful phantasies an intimate (perhaps an invariable) relation to this particular form of disease. Distrusting my own experience on the subject, I have during the last few years joined with my friends C. G. Jung of Zurich and Sándor Ferenczi of Budapest in investigating upon this single point a number of cases of paranoid disorder which have come under observation. The patients whose histories provided the material for this enquiry included both men and women, and varied in race, occupation, and social standing. Yet we were astonished to find that in all of these cases defence against a homosexual wish was clearly recognizable at the very centre of the conflict which underlay the disease and that it was in an attempt to master an unconsciously reinforced current of homosexuality that they had all of them come to grief.¹ This was certainly not what we had expected. Paranoia is precisely a disorder in which a sexual aetiology is by no means obvious; far from this, the strikingly prominent features in the causation of paranoia, especially among males, are social humiliations and slights. But if we go into the matter only a little more deeply, we shall be able to see that the really operative factor in these social injuries lies in the part played in them by the homosexual components of emotional life. So long as the individual is functioning normally and it is consequently impossible to see into the depths of his mental life, we may doubt whether his emotional relations to his neighbours in society have anything to do with sexuality, either actually or in their genesis. But delusions never fail to uncover these relations and to trace back the social feelings to their roots in a directly sensual erotic wish. So long as he was healthy, Dr. Schreber, too, whose delusions culminated in a wishful phantasy of an unmistakably homosexual nature, had, by all accounts, shown no signs of homosexuality in the ordinary sense of the word.

¹ Further confirmation is afforded by Maeder's analysis of a paranoid patient J. B. (1910). The present paper, I regret to say, was completed before I had an opportunity of reading Maeder's work.

I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

¹ Sadger (1910) and Freud (1910c).

² Freud, *Three Essays on the Theory of Sexuality* (1905d).

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to *esprit de corps* and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

In my *Three Essays on the Theory of Sexuality* I have expressed the opinion that each stage in the development of psychosexuality affords a possibility of 'fixation, and thus of a dispositional point. People who have not freed themselves completely from the stage of narcissism - who, that is to say, have at that point a fixation which may operate as a disposition to a later illness - are exposed to the danger that some unusually intense wave of libido, finding no other outlet, may lead to a sexualization of their social instincts and so undo the sublimations which they had achieved in the course of their development. This result may be produced by anything that causes the libido to flow backwards (i.e. that causes a 'regression'): whether, on the one hand, the libido becomes collaterally reinforced owing to some disappointment over a woman, or is directly dammed up owing to a mishap in social relations with other men - both of these being instances of 'frustration'; or whether, on the other hand, there is a general intensification of the libido, so that it becomes too powerful to find an outlet along the channels which are already open to it, and consequently bursts through its banks at the weakest spot. Since our analyses show that paranoics *endeavour to protect themselves against any such sexualization of their social instinctual cathexes*, we are driven to suppose that the weak spot in their development is to be looked for somewhere between the stages of auto-erotism, narcissism and homosexuality, and that their disposition to illness (which may perhaps be susceptible of more precise definition) must be located in that region. A similar disposition would have to be assigned to patients suffering from Kraepelin's dementia praecox or (as Bleuler has named it) *schizophrenia*; and we shall hope later on to find clues which will enable us to trace back the differences between the two disorders (as regards both the form they take and the course they run) to corresponding differences in the patients' dispositional fixations.

In taking the view, then, that what lies at the core of the conflict in cases of paranoia among males is a homosexual wishful phantasy of *loving a man*, we shall certainly not forget that the confirmation of such an important hypothesis can only follow upon the investigation of a large number of instances of every variety of paranoid disorder. We must therefore be prepared, if need be, to limit our assertion to a single type of paranoia. Nevertheless, it is a remarkable fact that the familiar principal forms of paranoia can all be represented as contradictions of the single proposition: '*I (a man) love him (a man)*'; and indeed that they exhaust all the possible ways in which such contradictions could be formulated.

The proposition '*I (a man) love him*' is contradicted by:

(a) Delusions of *persecution*; for they loudly assert:

'*I do not love him - I hate him.*'

This contradiction, which must have run thus in the unconscious,¹ cannot, however, become conscious to a paranoiac in this form. The mechanism of symptom-formation in paranoia requires that internal perceptions - feelings - shall be replaced by external perceptions. Consequently the proposition '*I hate him*' becomes transformed by *projection* into another one: '*He hates (persecutes) me*, which will justify me in hating him.' And thus the impelling unconscious feeling makes its appearance as though it were the consequence of an external perception:

'*I do not love him - I hate him, because HE PERSECUTES ME.*'

Observation leaves room for no doubt that the persecutor is some one who was once loved.

(b) Another element is chosen for contradiction in *erotomania*, which remains totally unintelligible on any other view:

'*I do not love him - I love her.*'

And in obedience to the same need for projection, the proposition is transformed into: '*I observe that she loves me.*'

'*I do not love him - I love her, because SHE LOVES ME.*'

Many cases of erotomania might give an impression that they could be satisfactorily explained as being exaggerated or distorted heterosexual fixations, if our attention were not attracted by the circumstance that these infatuations invariably begin, not with any internal perception of loving, but with an external perception of being loved. But in this form of paranoia the intermediate proposition '*I love her*' can also become conscious, because the contradiction between it and the original proposition is not a diametrical one, not so irreconcilable as that between love and hate: it is, after all, possible to love *her* as well as *him*. It can thus come about that the proposition which has been substituted by projection ('*she loves me*') may make way again for the 'basic language' proposition '*I love her*'.

¹ Or in the 'basic language', as Schreber would say.

(c) The third way in which the original proposition can be contradicted would be by delusions of *jealousy*, which we can study in the characteristic forms in which they appear in each sex.

(α) Alcoholic delusions of jealousy. The part played by alcohol in this disorder is intelligible in every way. We know that that source of pleasure removes inhibitions and undoes sublimations. It is not infrequently disappointment over a woman that drives a man to drink - but this means, as a rule, that he resorts to the public-house and to the company of men, who afford him the emotional satisfaction which he has failed to get from his wife at home. If now these men become the objects of a strong libidinal cathexis in his unconscious, he will ward it off with the third kind of contradiction:

'It is not *I* who love the man - *she* loves him', and he suspects the woman in relation to all the men whom he himself is tempted to love.

Distortion by means of projection is necessarily absent in this instance, since, with the change of the subject who loves, the whole process is in any case thrown outside the self. The fact that the woman loves the men is a matter of external perception to him; whereas the facts that he himself does not love but hates, or that he himself loves not this but that person, are matters of internal perception.

(β) Delusions of jealousy in women are exactly analogous.

'It is not *I* who love the women - *he* loves them.' The jealous woman suspects her husband in relation to all the women by whom she is herself attracted owing to her homosexuality and the dispositional effect of her excessive narcissism. The influence of the time of life at which her fixation occurred is clearly shown by the selection of the love-objects which she imputes to her husband; they are often old and quite inappropriate for a real love relation - revivals of the nurses and servants and girls who were her friends in childhood, or sisters who were her actual rivals.

[(d)] Now it might be supposed that a proposition consisting of three terms, such as '*I love him*', could only be contradicted in three different ways. Delusions of jealousy contradict the subject, delusions of persecution contradict the verb, and erotomania contradicts the object. But in fact a fourth kind of contradiction is possible - namely, one which rejects the proposition as a whole:

'*I do not love at all - I do not love any one.*' And since, after all, one's libido must go somewhere, this proposition seems to be the psychological equivalent of the proposition: '*I love only myself.*' So that this kind of contradiction would give us megalomania, which we may regard as a *sexual overvaluation of the ego* and may thus set beside the overvaluation of the love-object with which we are already familiar.¹

It is of some importance in connection with other parts of the theory of paranoia to notice that we can detect an element of megalomania in most other forms of paranoid disorder. We are justified in assuming that megalomania is essentially of an infantile nature and that, as development proceeds, it is sacrificed to social considerations. Similarly, an individual's megalomania is never so vehemently suppressed as when he is in the grip of an overpowering love:

Denn wo die Lieb' erwachet, stirbt
das Ich, der finstere Despot.²

After this discussion of the unexpectedly important part played by homosexual wishful phantasies in paranoia, let us return to the two factors in which we expected from the first to find the distinguishing marks of paranoia, namely, the mechanism *by which the symptoms are formed* and the mechanism *by which repression is brought about*.

We certainly have no right to begin by assuming that these two mechanisms are identical, and that symptom-formation follows the same path as repression, each proceeding along it, perhaps, in an opposite direction. Nor does there seem to be any great probability that such an identity exists. Nevertheless, we shall refrain from expressing any opinion on the subject until we have completed our investigation.

¹ *Three Essays on the Theory of Sexuality*. The same view and the same formulation will be found in the papers by Abraham and Maeder to which I have already referred.

² From the *Ghazals* of Muhammad ibn Muhammad (Jālāl al-Dīn) *Rumi*, translated by Rückert.

[For when the flames of love arise,
Then Self, the gloomy tyrant, dies.]

The most striking characteristic of symptom-formation in paranoia is the process which deserves the name of *projection*. An internal perception is suppressed, and, instead, its content, after undergoing a certain kind of distortion, enters consciousness in the form of an external perception. In delusions of persecution the distortion consists in a transformation of affect; what should have been felt internally as love is perceived externally as hate. We should feel tempted to regard this remarkable process as the most important element in paranoia and as being absolutely pathognomonic for it, if we were not opportunely reminded of two things. In the first place, projection does not play the same part in all forms of paranoia; and, in the second place, it makes its appearance not only in paranoia but under other psychological conditions as well, and in fact it has a regular share assigned to it in our attitude towards the external world. For when we refer the causes of certain sensations to the external world, instead of looking for them (as we do in the case of others) inside ourselves, this normal proceeding, too, deserves to be called projection. Having thus been made aware that more general psychological problems are involved in the question of the nature of projection, let us make up our minds to postpone the investigation of it (and with it that of the mechanism of paranoic symptom-formation in general) until some other occasion; and let us now turn to consider what ideas we can collect on the subject of the mechanism of repression in paranoia. I should like to say at once, in justification of this temporary renunciation, that we shall find that the manner in which the process of repression occurs is far more intimately connected with the developmental history of the libido and with the disposition to which it gives rise than is the manner in which symptoms are formed.

In psycho-analysis we have been accustomed to look upon pathological phenomena as being derived in a general way from repression. If we examine what is spoken of as 'repression' more closely, we shall find reason to split the process up into three phases which are easily distinguishable from one another conceptually.

(1) The first phase consists in *fixation*, which is the precursor and necessary condition of every 'repression'. Fixation can be described in this way. One instinct or instinctual component fails to accompany the rest along the anticipated normal path of development, and, in consequence of this inhibition in its development, it is left behind at a more infantile stage. The libidinal current in question then behaves in relation to later psychological structures like one belonging to the system of the unconscious, like one that is repressed. We have already shown that these instinctual fixations constitute the basis for the disposition to subsequent illness, and we may now add that they constitute above all the basis for the determination of the outcome of the third phase of repression.

(2) The second phase of repression is that of repression proper - the phase to which most attention has hitherto been given. It emanates from the more highly developed systems of the ego - systems which are capable of being conscious - and may in fact be described as a process of 'after-pressure'. It gives an impression of being an essentially active process, while fixation appears in fact to be a passive lagging behind. What undergo repression may either be the psychical derivatives of the original lagging instincts, when these have become reinforced and so come into conflict with the ego (or ego-syntonic instincts), or they may be psychical trends which have for other reasons aroused strong aversion. But this aversion would not in itself lead to repression, unless some connection had been established between the unwelcome trends which have to be repressed and those which have been repressed already. Where this is so, the repulsion exercised by the conscious system and the attraction exercised by the unconscious one tend in the same direction towards bringing about repression. The two possibilities which are here treated separately may in practice, perhaps, be less sharply differentiated, and the distinction between them may merely depend upon the greater or lesser degree in which the primarily repressed instincts contribute to the result.

(3) The third phase, and the most important as regards pathological phenomena, is that of failure of repression, of *irruption*, of *return of the repressed*. This irruption takes its start from the point of fixation, and it implies a regression of the libidinal development to that point.

We have already alluded to the multiplicity of the possible points of fixation; there are, in fact, as many as there are stages in the development of the libido. We must be prepared to find a similar multiplicity of the mechanisms of repression proper and of the mechanisms of irruption (or of symptom-formation), and we may already begin to suspect that it will not be possible to trace back all of these multiplicities to the developmental history of the libido alone.

It is easy to see that this discussion is beginning to trench upon the problem of 'choice of neurosis', which, however, cannot be taken in hand until preliminary work of another kind has been accomplished. Let us bear in mind for the present that we have already dealt with fixation, and that we have postponed the subject of symptom-formation; and let us restrict ourselves to the question of whether the analysis of Schreber's case throws any light upon the mechanism of repression proper which predominates in paranoia.

At the climax of his illness, under the influence of visions which were 'partly of a terrifying character, but partly, too, of an indescribable grandeur' (73), Schreber became convinced of the imminence of a great catastrophe, of the end of the world. Voices told him that the work of the past 14,000 years had now come to nothing, and that the earth's allotted span was only 212 years more (71); and during the last part of his stay in Flechsig's clinic he believed that that period had already elapsed. He himself was 'the only real man left alive', and the few human shapes that he still saw - the doctor, the attendants, the other patients - he explained as being 'miracled up, cursorily improvised men'. Occasionally the converse current of feeling also made itself apparent: a newspaper was put into his hands in which there was a report of his own death (81); he himself existed in a second, inferior shape, and in this second shape he one day quietly passed away (73). But the form of his delusion in which his ego was retained and the world sacrificed proved itself by far the more powerful. He had various theories of the cause of the catastrophe. At one time he had in mind a process of glaciation owing to the withdrawal of the sun; at another it was to be destruction by an earthquake, in the occurrence of which he, in his capacity of 'seer of spirits', was to act a leading part, just as another seer was alleged to have done in the Lisbon earthquake of 1755 (91). Or again, Flechsig was the culprit, since through his magic arts he had sown fear and terror among men, had wrecked the foundations of religion, and spread abroad general nervous disorders and immorality, so that devastating pestilences had descended upon mankind (91). In any case the end of the world was the consequence of the conflict which had broken out between him and Flechsig, or, according to the aetiology adopted in the second phase of his delusion, of the indissoluble bond which had been formed between him and God; it was, in fact, the inevitable result of his illness. Years afterwards, when Dr. Schreber had returned to human society, and could find no trace in the books, the musical scores, or the other articles of daily use which fell into his hands once more, of anything to bear out his theory that there had been a gap of vast duration in the history of mankind, he admitted that his view was no longer tenable: '... I can no longer avoid recognizing that, externally considered, everything is as it used to be. Whether, nevertheless, there may not have been a profound internal change is a question to which I shall recur later.' (84-5.) He could not bring himself to doubt that during his illness the world had come to an end and that, in spite of everything, the one that he now saw before him was a different one.

A world-catastrophe of this kind is not infrequent during the agitated stage in other cases of paranoia.¹ If we base ourselves on our theory of libidinal cathexis, and if we follow the hint given by Schreber's view of other people as being 'cursorily improvised men', we shall not find it difficult to explain these catastrophes.² The patient has withdrawn from the people in his environment and from the external world generally the libidinal cathexis which he has hitherto directed on to them. Thus everything has become indifferent and irrelevant to him, and has to be explained by means of a secondary rationalization as being 'miracled up, cursorily improvised'. The end of the world is the projection of this internal catastrophe; his subjective world has come to an end since his withdrawal of his love from it.³

After Faust has uttered the curses which free him from the world, the Chorus of Spirits sings:

Weh! Weh!
Du hast sie zerstört,
die schöne Welt,
mit mächtiger Faust!
sie stürzt, sie zerfällt!
Ein Halbgott hat sie zerschlagen!

.
Mächtiger
der Erdensöhne,
Prächtiger
baue sie wieder,
in deinem Busen baue sie auf!⁴

And the paranoic builds it again, not more splendid, it is true, but at least so that he can once more live in it. He builds it up by the world of his delusions. *The delusional formation, which we take to be the pathological product, is in reality an attempt at recovery, a process of reconstruction.* Such a reconstruction after the catastrophe is successful to a greater or lesser extent, but never wholly so; in Schreber's words, there has been a 'profound internal change' in the world. But the human subject has recaptured a relation, and often a very intense one, to the people and things in the world, even though the relation is a hostile one now, where formerly it was hopefully affectionate. We may say, then, that the process of repression proper consists in a detachment of the libido from people - and things - that were previously loved. It happens silently; we receive no intelligence of it, but can only infer it from subsequent events. What forces itself so noisily upon our attention is the process of recovery, which undoes the work of repression and brings back the libido again on to the people it had abandoned. In paranoia this process is carried out by the method of projection. It was incorrect to say that the perception which was suppressed internally is projected outwards; the truth is rather, as we now see, that what was abolished internally returns from without. The thorough examination of the process of projection which we have postponed to another occasion will clear up our remaining doubts on this subject.

¹ An 'end of the world' based upon other motives is to be found at the climax of the ecstasy of love (cf. Wagner's *Tristan und Isolde*); in this case it is not the ego but the single love-object which absorbs all the cathexes directed upon the external world.

² Cf. Abraham (1908) and Jung (1907). Abraham's short paper contains almost all the essential views put forward in the present study of the case of Schreber.

³ He has perhaps withdrawn from it not only his libidinal cathexis, but his interest in general - that is, the cathexes that proceed from his ego as well. This question is discussed below.

⁴ [Woe! Woe!
Thou hast it destroyed,
The beautiful world,
With powerful fist!
In ruins 'tis hurled,
By the blow of a demigod shattered!

.
Mightier
For the children of men,
More splendid
Build it again,
In thine own bosom build it anew!]

In the meantime, however, it is a source of some satisfaction to find that our newly acquired knowledge involves us in a number of further discussions.

(1) Our first reflection will tell us that it cannot be the case that this detachment of the libido occurs exclusively in paranoia; nor can it be that, where it occurs elsewhere, it has such disastrous consequences. It is quite possible that a detachment of the libido is the essential and regular mechanism of every repression. We can have no positive knowledge on that point until the other disorders that are based upon repression have been similarly examined. But it is certain that in normal mental life (and not only in periods of mourning) we are constantly detaching our libido in this way from people or from other objects without falling ill. When Faust freed himself from the world by uttering his curses, the result was not a paranoia or any other neurosis but simply a certain general frame of mind. The detachment of the libido, therefore, cannot in itself be the pathogenic factor in paranoia; there must be some special characteristic which distinguishes a paranoic detachment of the libido from other kinds. It is not difficult to suggest what that characteristic may be. What use is made of the libido after it has been set free by the process of detachment? A normal person will at once begin looking about for a substitute for the lost attachment; and until that substitute has been found the liberated libido will be kept in suspension within his mind, and will there give rise to tensions and colour his mood. In hysteria the liberated libido becomes transformed into somatic innervations or into anxiety. But in paranoia the clinical evidence goes to show that the libido, after it has been withdrawn from the object, is put to a special use. It will be remembered that the majority of cases of paranoia exhibit traces of megalomania, and that megalomania can by itself constitute a paranoia. From this it may be concluded that in paranoia the liberated libido becomes attached to the ego, and is used for the aggrandizement of the ego. A return is thus made to the stage of narcissism (known to us from the development of the libido), in which a person's only sexual object is his own ego. On the basis of this clinical evidence we can suppose that paranoics have brought along with them a *fixation at the stage of narcissism*, and we can assert that the length of *the step back from sublimated homosexuality to narcissism* is a measure of the amount of *regression* characteristic of paranoia.

(2) An equally plausible objection can be based upon Schreber's case history, as well as upon many others. For it can be urged that the delusions of persecution (which were directed against Flechsig) unquestionably made their appearance at an earlier date than the phantasy of the end of the world; so that what is supposed to have been a return of the repressed actually preceded the repression itself - and this is patent nonsense. In order to meet this objection we must leave the high ground of generalization and descend to the detailed consideration of actual circumstances, which are undoubtedly very much more complicated. We must admit the possibility that a detachment of the libido such as we are discussing might just as easily be a partial one, a drawing back from some single complex, as a general one. A partial detachment should be by far the commoner of the two, and should precede a general one, since to begin with it is only for a partial detachment that the influences of life provide a motive. The process may then stop at the stage of a partial detachment or it may spread to a general one, which will loudly proclaim its presence in the symptoms of megalomania. Thus the detachment of the libido from the figure of Flechsig may nevertheless have been what was primary in the case of Schreber; it was immediately followed by the appearance of the delusion, which brought back the libido on to Flechsig again (though with a negative sign to mark the fact that repression had taken place) and thus annulled the work of repression. And now the battle of repression broke out anew, but this time with more powerful weapons. In proportion as the object of contention became the most important thing in the external world, trying on the one hand to draw the whole of the libido on to itself, and on the other hand mobilizing all the resistances against itself, so the struggle raging around this single object became more and more comparable to a general engagement; till at length a victory for the forces of repression found expression in a conviction that the world had come to an end and that the self alone survived. If we review the ingenious constructions which were raised by Schreber's delusion in the domain of religion - the hierarchy of God, the proved souls, the fore-courts of Heaven, the lower and the upper God - we can gauge in retrospect the wealth of sublimations which were brought down in ruin by the catastrophe of the general detachment of his libido.

(3) A third consideration which arises from the views that have been developed in these pages is as follows. Are we to suppose that a general detachment of the libido from the external world would be an effective enough agent to account for the 'end of the world'? Or would not the ego-cathexes which still remained in existence have been sufficient to maintain *rapport* with the external world? To meet this difficulty we should either have to assume that what we call libidinal cathexis (that is, interest emanating from erotic sources) coincides with interest in general, or we should have to consider the possibility that a very widespread disturbance in the distribution of libido may bring about a corresponding disturbance in the ego-cathexes. But these are problems which we are still quite helpless and incompetent to solve. It would be otherwise if we could start out from some well-grounded theory of instincts; but in fact we have nothing of the kind at our disposal. We regard instinct as being the concept on the frontier-line between the somatic and the mental, and see in it the psychical representative of organic forces. Further, we accept the popular distinction between ego-instincts and a sexual instinct; for such a distinction seems to agree with the biological conception that the individual has a double orientation, aiming on the one hand at self-preservation and on the other at the preservation of the species. But beyond this are only hypotheses, which we have taken up - and are quite ready to drop again - in order to help us to find our bearings in the chaos of the obscurer processes of the mind. What we expect from psycho-analytic investigations of pathological mental processes is precisely that they shall drive us to some conclusions on questions connected with the theory of instincts. These investigations, however, are in their infancy and are only being carried out by isolated workers, so that the hopes we place in them must still remain unfulfilled. We can no more dismiss the possibility that disturbances of the libido may react upon the ego-cathexes than we can overlook the converse possibility - namely, that a secondary or induced disturbance of the libidinal processes may result from abnormal changes in the ego. Indeed, it is probable that processes of this kind constitute the distinctive characteristic of psychoses. How much of all this may apply to paranoia it is impossible at present to say. There is one consideration, however, on which I should like to lay stress. It cannot be asserted that a paranoid, even at the height of the repression, withdraws his interest from the external world completely - as must be considered to occur in certain other kinds of hallucinatory psychosis (such as Meynert's amentia). The paranoid perceives the external world and takes into account any alterations that may happen in it, and the effect it makes upon him stimulates him to invent explanatory theories (such as Schreber's 'cursorily improvised men'). It therefore appears to me far more probable that the paranoid's altered relation to the world is to be explained entirely or in the main by the loss of his libidinal interest.

(4) It is impossible to avoid asking, in view of the close connection between the two disorders, how far this conception of paranoia will affect our conception of dementia praecox. I am of opinion that Kraepelin was entirely justified in taking the step of separating off a large part of what had hitherto been called paranoia and merging it, together with catatonia and certain other forms of disease, into a new clinical unit - though 'dementia praecox' was a particularly unhappy name to choose for it. The designation chosen by Bleuler for the same group of forms - 'schizophrenia' - is also open to the objection that the name appears appropriate only so long as we forget its literal meaning. For otherwise it prejudices the issue, since it is based on a characteristic of the disease which is theoretically postulated - a characteristic, moreover, which does not belong exclusively to that disease, and which, in the light of other considerations, cannot be regarded as the essential one. However, it is not on the whole of very great importance what names we give to clinical pictures. What seems to me more essential is that paranoia should be maintained as an independent clinical type, however frequently the picture it offers may be complicated by the presence of schizophrenic features. For, from the standpoint of the libido theory, while it would resemble dementia praecox in so far as the repression proper would in both disorders have the same principal feature - detachment of the libido, together with its regression on to the ego - it would be distinguished from dementia praecox by having its dispositional fixation differently located and by having a different mechanism for the return of the repressed (that is, for the formation of symptoms). It would seem to me the most convenient plan to give dementia praecox the name of *paraphrenia*. This term has no special connotation, and it would serve to indicate a relationship with paranoia (a name which cannot be changed) and would further recall hebephrenia, an entity which is now merged in dementia praecox. It is true that the name has already been proposed for other purposes; but this need not concern us, since the alternative applications have not passed into general use.

Abraham has very convincingly shown ¹ that the turning away of the libido from the external world is a particularly clearly-marked feature in dementia praecox. From this feature we infer that the repression is effected by means of detachment of the libido. Here once more we may regard the phase of violent hallucinations as a struggle between repression and an attempt at recovery by bringing the libido back again on to its objects. Jung, with extraordinary analytic acumen, has perceived that the deliria² and motor stereotypes occurring in this disorder are the residues of former object-cathexes, clung to with great persistence. This attempt at recovery, which observers mistake for the disease itself, does not, as in paranoia, make use of projection, but employs a hallucinatory (hysterical) mechanism. This is one of the two major respects in which dementia praecox differs from paranoia; and this difference can be explained genetically from another direction. The second difference is shown by the outcome of the disease in those cases where the process has not remained too restricted. The prognosis is on the whole more unfavourable than in paranoia. The victory lies with repression and not, as in the former, with reconstruction. The regression extends not merely to narcissism (manifesting itself in the shape of megalomania) but to a complete abandonment of object-love and a return to infantile auto-erotism. The dispositional fixation must therefore be situated further back than in paranoia, and must lie some where at the beginning of the course of development from auto-erotism to object-love. Moreover, it is not at all likely that homosexual impulses, which are so frequently - perhaps invariably - to be found in paranoia, play an equally important part in the aetiology of that far more comprehensive disorder, dementia praecox.

¹ In the paper already quoted.

² [In French and German psychiatry the word 'delirium' is often used of delusional states.]

Our hypotheses as to the dispositional fixations in paranoia and paraphrenia make it easy to see that a case may begin with paranoid symptoms and may yet develop into a dementia praecox, and that paranoid and schizophrenic phenomena may be combined in any proportion. And we can understand how a clinical picture such as Schreber's can come about, and merit the name of a paranoid dementia, from the fact that in its production of a wishful phantasy and of hallucinations it shows paraphrenic traits, while in its exciting cause, in its use of the mechanism of projection, and in its outcome it exhibits a paranoid character. For it is possible for several fixations to be left behind in the course of development, and each of these in succession may allow an irruption of the libido that has been pushed off - beginning, perhaps, with the later acquired fixations, and going on, as the illness develops, to the original ones that lie nearer the starting-point. We should be glad to know to what conditions the relatively favourable issue of the present case is due; for we cannot willingly attribute the whole responsibility for the outcome to anything so casual as the 'improvement due to change in domicile',¹ which set in after the patient's removal from Flechsig's clinic. But our insufficient acquaintance with the intimate circumstances of the history of the case makes it impossible to give an answer to this interesting question. It may be suspected, however, that what enabled Schreber to reconcile himself to his homosexual phantasy, and so made it possible for his illness to terminate in something approximating to a recovery, may have been the fact that his father-complex was in the main positively toned and that in real life the later years of his relationship with an excellent father had probably been unclouded.

¹ Cf. Riklin (1905).

Since I neither fear the criticism of others nor shrink from criticizing myself, I have no motive for avoiding the mention of a similarity which may possibly damage our libido theory in the estimation of many of my readers. Schreber's 'rays of God', which are made up of a condensation of the sun's rays, of nerve fibres, and of spermatozoa, are in reality nothing else than a concrete representation and projection outwards of libidinal cathexes; and they thus lend his delusions a striking conformity with our theory. His belief that the world must come to an end because his ego was attracting all the rays to itself, his anxious concern at a later period, during the process of reconstruction, lest God should sever His ray-connection with him, - these and many other details of Schreber's delusional structure sound almost like endopsychic perceptions of the processes whose existence I have assumed in these pages as the basis of our explanation of paranoia. I can nevertheless call a friend and fellow-specialist to witness that I had developed my theory of paranoia before I became acquainted with the contents of Schreber's book. It remains for the future to decide whether there is more delusion in my theory than I should like to admit, or whether there is more truth in Schreber's delusion than other people are as yet prepared to believe.

Lastly, I cannot conclude the present work, which is once again only a fragment of a larger whole, without foreshadowing the two chief theses towards the establishment of which the libido theory of the neuroses and psychoses is advancing: namely, that the neuroses arise in the main from a conflict between the ego and the sexual instinct, and that the forms which the neuroses assume retain the imprint of the course of development followed by the libido - and by the ego.

POSTSCRIPT (1912)

In dealing with the case history of Senatspräsident Schreber I purposely restricted myself to a minimum of interpretation and I feel confident that every reader with a knowledge of psycho-analysis will have learned from the material which I presented more than was explicitly stated by me, and that he will have found no difficulty in drawing the threads closer and in reaching conclusions at which I no more than hinted. By a happy chance the same issue of this periodical as that in which my own paper appeared showed that the attention of some other contributors had been directed to Schreber's autobiography, and made it easy to guess how much more material remains to be gathered from the symbolic content of the phantasies and delusions of this gifted paranoic.¹

Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon *mythology*. I mentioned on p. 2425 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father-symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.²

It is to this delusional privilege of being able to gaze at the sun without being dazzled that the mythological interest attaches. We read in Reinach³ that the natural historians of antiquity attributed this power to the eagle alone, who, as a dweller in the highest regions of the air, was brought into especially intimate relation with the heavens, with the sun, and with lightning.⁴ We learn from the same sources, moreover, that the eagle puts his young to a test before recognizing them as his legitimate offspring. Unless they can succeed in looking into the sun without blinking they are thrown out of the eyrie.

¹ Cf. Jung (1911, 164 and 207); and Spielrein (1911, 350).

² See the footnote to page 139 of Schreber's book.

³ Reinach (1905-12, 3, 80), quoting Keller (1887).

⁴ Representations of eagles were set up at the highest points of temples, so as to serve as 'magical' lightning-conductors. (Cf. Reinach, loc. cit.)

There can be no doubt about the meaning of this animal myth. It is certain that this is merely ascribing to animals something that is a hallowed custom among men. The procedure gone through by the eagle with his young is an *ordeal*, a test of lineage, such as is reported of the most various races of antiquity. Thus the Celts living on the banks of the Rhine used to entrust their new-born babies to the waters of the river, in order to ascertain whether they were truly of their own blood. The clan of Psylli, who inhabited what is now Tripoli, boasted that they were descended from snakes, and used to expose their infants to contact with them; those who were true-born children of the clan were either not bitten or recovered rapidly from the effects of the bite.¹ The assumption underlying these trials leads us deep into the *totemic* habits of thought of primitive peoples. The totem - an animal, or a natural force animistically conceived, to which the tribe traces back its origin - spares the members of the tribe as being its own children, just as it itself is honoured by them as being their ancestor and is spared by them. We have here arrived at the consideration of matters which, as it seems to me, may make it possible to arrive at a psycho-analytic explanation of the origins of religion.

The eagle, then, who makes his young look into the sun and requires of them that they shall not be dazzled by its light, is behaving as though he were himself a descendant of the sun and were submitting his children to a test of their ancestry. And when Schreber boasts that he can look into the sun unscathed and undazzled, he has rediscovered the mythological method of expressing his filial relation to the sun, and has confirmed us once again in our view that the sun is a symbol of the father. It will be remembered that during his illness Schreber gave free expression to his family pride,² and that we discovered in the fact of his childlessness a human motive for his having fallen ill with a feminine wishful phantasy. Thus the connection between his delusional privilege and the basis of his illness becomes evident.

¹ For lists of references see Reinach, loc. cit. and *ibid.*, 1, 74.

² The Schrebers are 'members of the highest nobility of Heaven' (24). - '*Adel*' is the attribute of an '*Adler*'. ['*Adel*' means 'nobility' or 'noble'. '*Adler*' means 'eagle' or 'noble (person)'.]

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoeic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago,¹ and add that the same holds good of the forces that construct religions. And I am of opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psycho-analysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the *child* and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the *savage* too,' we may now add, 'upon the *primitive* man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'

THE HANDLING OF DREAM-INTERPRETATION IN PSYCHO-ANALYSIS
(1911)

Intentionally left blank

THE HANDLING OF DREAM-INTERPRETATION IN PSYCHO-ANALYSIS

The *Zentralblatt für Psychoanalyse* was not designed solely to keep its readers informed of the advances made in psycho-analytic knowledge, and itself to publish comparatively short contributions to the subject; it aims also at accomplishing the further tasks of presenting to the student a clear outline of what is already known, and of economizing the time and effort of beginners in analytic practice by offering them suitable instructions. Henceforward, therefore, articles of a didactic nature and on technical subjects, not necessarily containing new matter, will appear as well in this journal.

The question with which I now intend to deal is not that of the technique of dream-interpretation: neither the methods by which dreams should be interpreted nor the use of such interpretations when made will be considered, but only the way in which the analyst should employ the art of interpretation in the psycho-analytic treatment of patients. There are undoubtedly different ways of going to work in the matter, but then the answer to questions of technique in analysis is never a matter of course. Although there may perhaps be more than one good road to follow, still there are very many bad ones, and a comparison of the various methods cannot fail to be illuminating, even if it should not lead to a decision in favour of any particular one.

Anyone coming from dream-interpretation to analytic practice will retain his interest in the content of dreams, and his inclination will be to interpret as fully as possible every dream related by the patient. But he will soon remark that he is now working under quite different conditions, and that if he attempts to carry out his intention he will come into collision with the most immediate tasks of the treatment. Even if a patient's first dream proves to be admirably suited for the introduction of the first explanations to be given, other dreams will promptly appear, so long and so obscure that the full meaning cannot be extracted from them in the limited session of one day's work. If the doctor continues the work of interpretation during the following days, fresh dreams will be produced in the meantime and these will have to be put aside until he can regard the first dream as finally resolved. The production of dreams is at times so copious, and the patient's progress towards comprehension of them so hesitant, that a suspicion will force itself on the analyst that the appearance of the material in this manner may be simply a manifestation of the patient's resistance taking advantage of the discovery that the method is unable to master what is so presented. Moreover, the treatment will meanwhile have fallen quite a distance behind the present and have lost touch with actuality. In opposition to such a technique stands the rule that it is of the greatest importance for the treatment that the analyst should always be aware of the surface of the patient's mind at any given moment, that he should know what complexes and resistances are active in him at the time and what conscious reaction to them will govern his behaviour. It is scarcely ever right to sacrifice this therapeutic aim to an interest in dream-interpretation.

What then, if we bear this rule in mind, is to be our attitude to interpreting dreams in analysis? More or less as follows: The amount of interpretation which can be achieved in one session should be taken as sufficient and it is not to be regarded as a loss if the content of the dream is not fully discovered. On the following day, the interpretation of the dream is not to be taken up again as a matter of course, until it has become evident that nothing else has meanwhile forced its way into the foreground of the patient's thoughts. Thus no exception in favour of an interrupted dream-interpretation is to be made to the rule that the first thing that comes into the patient's head is the first thing to be dealt with. If fresh dreams occur before the earlier ones have been disposed of, the more recent productions are to be attended to, and no uneasiness need be felt about neglecting the older ones. If the dreams become altogether too diffuse and voluminous, all hope of completely unravelling them should tacitly be given up from the start. One must in general guard against displaying very special interest in the interpretation of dreams, or arousing an idea in the patient that the work would come to a standstill if he were to bring up no dreams; otherwise there is a danger of the resistance being directed to the production of dreams, with a consequent cessation of them. The patient must be brought to believe, on the contrary, that the analysis invariably finds material for its continuation, regardless of whether or no he brings up dreams or what amount of attention is devoted to them.

It will now be asked whether we shall not be giving up too much valuable material which might throw light on the unconscious if dream-interpretation is only to be carried out subject to such restrictions of method. The answer to this is that the loss is by no means so great as might appear from a superficial view of the matter. To begin with, it must be recognized that in cases of severe neurosis any elaborate dream-productions must from the nature of things be regarded as incapable of complete solution. A dream of this kind is often based on the entire pathogenic material of the case, as yet unknown to both doctor and patient (so called 'programme-dreams' and biographical dreams), and is sometimes equivalent to a translation into dream-language of the whole content of the neurosis. In the attempt to interpret such a dream all the latent, as yet untouched, resistances will be roused to activity and soon set a limit to its understanding. The full interpretation of such a dream will coincide with the completion of the whole analysis; if a note is made of it at the beginning, it may be possible to understand it at the end, many months later. It is the same as with the elucidation of a single symptom (the main symptom, perhaps). The whole analysis is needed to explain it; in the course of the treatment one must endeavour to lay hold first of this, then of that, fragment of the symptom's meaning, one after another, until they can all be pieced together. Similarly, no more can be expected of a dream occurring in the early stages of the analysis; one must be content if the attempt at interpretation brings a single pathogenic wishful impulse to light.

Thus nothing attainable is renounced if one gives up the idea of a complete dream-interpretation; nor is anything lost as a rule if one breaks off the interpretation of a comparatively old dream and turns to a more recent one. We have found from fine examples of fully analysed dreams that several successive scenes of one dream may have the same content, which may find expression in them with increasing clarity; and we have learnt, too, that several dreams occurring in the same night need be nothing more than attempts, expressed in various forms, to represent one meaning. In general, we may rest assured that every wishful impulse which creates a dream to-day will re-appear in other dreams as long as it has not been understood and withdrawn from the domination of the unconscious. It often happens, therefore, that the best way to complete the interpretation of a dream is to leave it and to devote one's attention to a new dream, which may contain the same material in a possibly more accessible form. I know that it is asking a great deal, not only of the patient but also of the doctor, to expect them to give up their conscious purposive aims during the treatment, and to abandon themselves to a guidance which, in spite of everything, still seems to us 'accidental'. But I can answer for it that one is rewarded every time one resolves to have faith in one's own theoretical principles, and prevails upon oneself not to dispute the guidance of the unconscious in establishing connecting links.

I submit, therefore, that dream-interpretation should not be pursued in analytic treatment as an art for its own sake, but that its handling should be subject to those technical rules that govern the conduct of the treatment as a whole. Occasionally, of course, one can act otherwise and allow a little free play to one's theoretical interest; but one should always be aware of what one is doing. Another situation to be considered is one which has arisen since we have acquired more confidence in our understanding of dream-symbolism, and know ourselves to be more independent of the patient's associations. An unusually skilful dream-interpreter will sometimes find himself in the position of being able to see through every one of a patient's dreams without requiring him to go through the tedious and time-absorbing process of working over them. Such an analyst is thus exempt from any conflict between the demands of dream-interpretation and those of the treatment. Moreover he will be tempted to make full use of dream-interpretation on every occasion, by telling the patient everything he has detected in his dreams. In doing so, however, he will have adopted a method of treatment which departs considerably from the established one, as I shall point out in another connection. Beginners in psycho-analytic practice, at any rate, are advised not to take this exceptional case as a model.

Every analyst is in the position of the superior dream-interpreter, whom we have been imagining, in regard to the very first dreams that his patients bring, before they have learnt anything of the technique of translating dreams. These initial dreams may be described as unsophisticated: they betray a great deal to the listener, like the dreams of so-called healthy people. The question then arises whether the analyst is at once to translate to the patient all that he himself reads from them. This, however, is not the place for answering this question, for it evidently forms part of a wider one: at what stage in the treatment and how rapidly should the analyst introduce the patient to the knowledge of what lies veiled in his mind? The more the patient has learnt of the practice of dream-interpretation, the more obscure do his later dreams as a rule become. All the knowledge acquired about dreams serves also to put the dream-constructing process on its guard.

In the 'scientific' works about dreams, which in spite of their repudiation of dream-interpretation have received a new stimulus from psycho-analysis, one constantly finds that scrupulous care is most unnecessarily attached to the accurate preservation of the text of the dream. This is supposed to need protection from distortions and attritions in the hours immediately after waking. Some psycho-analysts, even, in giving the patient instructions to write down every dream immediately upon waking, seem not to rely consistently enough upon their knowledge of the conditions of dream-formation. In therapeutic work this rule is superfluous; and patients are glad to make use of it to disturb their sleep and to display great zeal where it can serve no useful purpose. For even if the text of a dream is in this way laboriously rescued from oblivion, it is easy enough to convince oneself that nothing has been achieved for the patient. Associations will not come to the text, and the result is the same as if the dream had not been preserved. No doubt the doctor has acquired some knowledge which he would not have done otherwise. But it is not the same thing whether the analyst knows something or the patient knows it; the importance of this distinction for the technique of psycho-analysis will be more fully considered elsewhere.

In conclusion, I will mention a particular type of dream which, in the nature of the case, occurs only in the course of psycho-analytic treatment, and may bewilder or mislead beginners. These are the corroborative dreams which, as it were 'tag along behind'; they are easily accessible to analysis, and their translation merely presents what the treatment has inferred during the last new days from the material of the daily associations. When this happens, it looks as though the patient has been amiable enough to bring us in dream-form exactly what we had been 'suggesting' to him immediately before. The more experienced analyst will no doubt have some difficulty in attributing any such amiability to the patient; he accepts such dreams as hoped-for confirmations, and recognizes that they are only observed under certain conditions brought about by the influence of the treatment. The great majority of dreams forge ahead of the analysis; so that, after subtraction of everything in them which is already known and understood, there still remains a more or less clear hint at something which has hitherto been hidden.

THE DYNAMICS OF TRANSFERENCE
(1912)

Intentionally left blank

THE DYNAMICS OF TRANSFERENCE

The almost inexhaustible topic of transference has recently been dealt with by Wilhelm Stekel in this journal on descriptive lines. I should like in the following pages to add a few remarks to explain how it is that transference is necessarily brought about during a psycho-analytic treatment, and how it comes to play its familiar part in it.

It must be understood that each individual, through the combined operation of his innate disposition and the influences brought to bear on him during his early years, has acquired a specific method of his own in his conduct of his erotic life - that is, in the preconditions to falling in love which he lays down, in the instincts he satisfies and the aims he sets himself in the course of it.¹ This produces what might be described as a stereotype plate (or several such), which is constantly repeated - constantly reprinted afresh - in the course of the person's life, so far as external circumstances and the nature of the love objects accessible to him permit, and which is certainly not entirely insusceptible to change in the face of recent experiences. Now, our observations have shown that only a portion of these impulses which determine the course of erotic life have passed through the full process of psychical development. That portion is directed towards reality, is at the disposal of the conscious personality, and forms a part of it. Another portion of the libidinal impulses has been held up in the course of development; it has been kept away from the conscious personality and from reality, and has either been prevented from further expansion except in phantasy or has remained wholly in the unconscious so that it is unknown to the personality's consciousness. If someone's need for love is not entirely satisfied by reality, he is bound to approach every new person whom he meets with libidinal anticipatory ideas; and it is highly probable that both portions of his libido, the portion that is capable of becoming conscious as well as the unconscious one, have a share in forming that attitude.

¹ I take this opportunity of defending myself against the mistaken charge of having denied the importance of innate (constitutional) factors because I have stressed that of infantile impressions. A charge such as this arises from the restricted nature of what men look for in the field of causation: in contrast to what ordinarily holds good in the real world, people prefer to be satisfied with a single causative factor. Psycho-analysis has talked a lot about the accidental factors in aetiology and little about the constitutional ones; but that is only because it was able to contribute something fresh to the former, while, to begin with, it knew no more than was commonly known about the latter. We refuse to posit any contrast in principle between the two sets of aetiological factors; on the contrary, we assume that the two sets regularly act jointly in bringing about the observed result. *Δαίμων καὶ Τύχη* [Endowment and Chance] determine a man's fate - rarely or never one of these powers alone. The amount of aetiological effectiveness to be attributed to each of them can only be arrived at in every individual case separately. These cases may be arranged in a series according to the varying proportion in which the two factors are present, and this series will no doubt have its extreme cases. We shall estimate the share taken by constitution or experience differently in individual cases according to the stage reached by our knowledge; and we shall retain the right to modify our judgement along with changes in our understanding. Incidentally, one might venture to regard constitution itself as a precipitate from the accidental effects produced on the endlessly long chain of our ancestors.

Thus it is a perfectly normal and intelligible thing that the libidinal cathexis of someone who is partly unsatisfied, a cathexis which is held ready in anticipation, should be directed as well to the figure of the doctor. It follows from our earlier hypothesis that this cathexis will have recourse to prototypes, will attach itself to one of the stereotype plates which are present in the subject; or, to put the position in another way, the cathexis will introduce the doctor into one of the psychical 'series' which the patient has already formed. If the 'father-imago', to use the apt term introduced by Jung (1911, 164) is the decisive factor in bringing this about, the outcome will tally with the real relations of the subject to his doctor. But the transference is not tied to this particular prototype: it may also come about on the lines of the mother-imago or brother-imago. The peculiarities of the transference to the doctor, thanks to which it exceeds, both in amount and nature, anything that could be justified on sensible or rational grounds, are made intelligible if we bear in mind that this transference has precisely been set up not only by the *conscious* anticipatory ideas but also by those that have been held back or are unconscious.

There would be nothing more to discuss or worry about in this behaviour of transference, if it were not that two points remain unexplained about it which are of particular interest to psycho-analysis. Firstly, we do not understand why transference is so much more intense with neurotic subjects in analysis than it is with other such people who are not being analysed; and secondly, it remains a puzzle why in analysis transference emerges as *the most powerful resistance* to the treatment, whereas outside analysis it must be regarded as the vehicle of cure and the condition of success. For our experience has shown us - and the fact can be confirmed as often as we please - that if a patient's free associations fail¹ the stoppage can invariably be removed by an assurance that he is being dominated at the moment by an association which is concerned with the doctor himself or with something connected with him. As soon as this explanation is given, the stoppage is removed, or the situation is changed from one in which the associations fail into one in which they are being kept back. At first sight it appears to be an immense disadvantage in psycho-analysis as a method that what is elsewhere the strongest factor towards success is changed in it into the most powerful medium of resistance. If, however, we examine the situation more closely, we can at least clear away the first of our two problems. It is not a fact that transference emerges with greater intensity and lack of restraint during psycho-analysis than outside it. In institutions in which nerve patients are treated non-analytically, we can observe transference occurring with the greatest intensity and in the most unworthy forms, extending to nothing less than mental bondage, and moreover showing the plainest erotic colouring. Gabriele Reuter, with her sharp powers of observation, described this at a time when there was no such thing as psycho-analysis, in a remarkable book which betrays in every respect the clearest insight into the nature and genesis of neuroses.² These characteristics of transference are therefore to be attributed not to psycho-analysis but to neurosis itself.

¹ I mean when they really cease, and not when, for instance, the patient keeps them back owing to ordinary feelings of unpleasure.

² *Aus guter Familie*, Berlin, 1895.

Our second problem - the problem of why transference appears in psycho-analysis as resistance - has been left for the moment untouched; and we must now approach it more closely. Let us picture the psychological situation during the treatment. An invariable and indispensable precondition of every onset of a psychoneurosis is the process to which Jung has given the appropriate name of 'introversion'.¹ That is to say: the portion of libido which is capable of becoming conscious and is directed towards reality is diminished, and the portion which is directed away from reality and is unconscious, and which, though it may still feed the subject's phantasies, nevertheless belongs to the unconscious, is proportionately increased. The libido (whether wholly or in part) has entered on a regressive course and has revived the subject's infantile imagos.² The analytic treatment now proceeds to follow it; it seeks to track down the libido, to make it accessible to consciousness and, in the end, serviceable for reality. Where the investigations of analysis come upon the libido withdrawn into its hiding-place, a struggle is bound to break out; all the forces which have caused the libido to regress will rise up as 'resistances' against the work of analysis, in order to conserve the new state of things. For if the libido's introversion or regression had not been justified by a particular relation between the subject and the external world - stated in the most general terms, by the frustration of satisfaction - and if it had not for the moment even become expedient, it could never have taken place at all. But the resistances from this source are not the only ones or indeed the most powerful. The libido at the disposal of the subject's personality had always been under the influence of the attraction of his unconscious complexes (or more correctly, of the portions of those complexes belonging to the unconscious), and it entered on a regressive course because the attraction of reality had diminished. In order to liberate it, this attraction of the unconscious has to be overcome; that is, the repression of the unconscious instincts and of their productions, which has meanwhile been set up in the subject, must be removed. This is responsible for by far the largest part of the resistance, which so often causes the illness to persist even after the turning away from reality has lost its temporary justification. The analysis has to struggle against the resistances from both these sources. The resistance accompanies the treatment step by step. Every single association, every act of the person under treatment must reckon with the resistance and represents a compromise between the forces that are striving towards recovery and the opposing ones which I have described.

¹ Even though some of Jung's remarks give the impression that he regards this introversion as something which is characteristic of dementia praecox and does not come into account in the same way in other neuroses.

² It would be convenient if we could say 'it has recathected his infantile complexes'. But this would be incorrect: the only justifiable way of putting it would be 'the unconscious portions of those complexes'. The topics dealt with in this paper are so extraordinarily involved that it is tempting to embark on a number of contiguous problems whose clarification would in point of fact be necessary before it would be possible to speak in unambiguous terms of the psychical processes that are to be described here. These problems include the drawing of a line of distinction between introversion and regression, the fitting of the theory of complexes into the libido theory, the relations of phantasying to the conscious and the unconscious as well as to reality - and others besides. I need not apologize for having resisted this temptation in the present paper.

If now we follow a pathogenic complex from its representation in the conscious (whether this is an obvious one in the form of a symptom or something quite inconspicuous) to its root in the unconscious, we shall soon enter a region in which the resistance makes itself felt so clearly that the next association must take account of it and appear as a compromise between its demands and those of the work of investigation. It is at this point, on the evidence of our experience, that transference enters on the scene. When anything in the complexive material (in the subject-matter of the complex) is suitable for being transferred on to the figure of the doctor, that transference is carried out; it produces the next association, and announces itself by indications of a resistance - by a stoppage, for instance. We infer from this experience that the transference-idea has penetrated into consciousness in front of any other possible associations *because* it satisfies the resistance. An event of this sort is repeated on countless occasions in the course of an analysis. Over and over again, when we come near to a pathogenic complex, the portion of that complex which is capable of transference is first pushed forward into consciousness and defended with the greatest obstinacy.¹

¹ This, however, should not lead us to conclude in general that the element selected for transference-resistance is of peculiar pathogenic importance. If in the course of a battle there is a particularly embittered struggle over the possession of some little church or some individual farm, there is no need to suppose that the church is a national shrine perhaps, or that the house shelters the army's pay-chest. The value to the object may be a purely tactical one and may perhaps emerge only in this one battle.

After it has been overcome, the overcoming of the other portions of the complex raises few further difficulties. The longer an analytic treatment lasts and the more clearly the patient realizes that distortions of the pathogenic material cannot by themselves offer any protection against its being uncovered, the more consistently does he make use of the one sort of distortion which obviously affords him the greatest advantages - distortion through transference. These circumstances tend towards a situation in which finally every conflict has to be fought out in the sphere of transference.

Thus transference in the analytic treatment invariably appears to us in the first instance as the strongest weapon of the resistance, and we may conclude that the intensity and persistence of the transference are an effect and an expression of the resistance. The *mechanism* of transference is, it is true, dealt with when we have traced it back to the state of readiness of the libido, which has remained in possession of infantile imagoes; but the part transference plays in the treatment can only be explained if we enter into its relations with resistance.

How does it come about that transference is so admirably suited to be a means of resistance? It might be thought that the answer can be given without difficulty. For it is evident that it becomes particularly hard to admit to any proscribed wishful impulse if it has to be revealed in front of the very person to whom the impulse relates. Such a necessity gives rise to situations which in the real world seem scarcely possible. But it is precisely this that the patient is aiming at when he makes the object of his emotional impulses coincide with the doctor. Further consideration, however, shows that this apparent gain cannot provide the solution of the problem. Indeed, a relation of affectionate and devoted dependence can, on the contrary help a person over all the difficulties of making an admission. In analogous real situations people will usually say: 'I feel no shame in front of you: I can say anything to you.' Thus the transference to the doctor might just as easily serve to *facilitate* admissions, and it is not clear why it should make things more difficult.

The answer to the question which has been repeated so often in these pages is not to be reached by further reflection but by what we discover when we examine individual transference resistances occurring during treatment. We find in the end that we cannot understand the employment of transference as resistance so long as we think simply of 'transference'. We must make up our minds to distinguish a 'positive' transference from a 'negative' one, the transference of affectionate feelings from that of hostile ones, and to treat the two sorts of transference to the doctor separately. Positive transference is then further divisible into transference of friendly or affectionate feelings which are admissible to consciousness and transference of prolongations of those feelings into the unconscious. As regards the latter, analysis shows that they invariably go back to erotic sources. And we are thus led to the discovery that all the emotional relations of sympathy, friendship, trust, and the like, which can be turned to good account in our lives, are genetically linked with sexuality and have developed from purely sexual desires through a softening of their sexual aim, however pure and unsensual they may appear to our conscious self-perception. Originally we knew only sexual objects; and psycho-analysis shows us that people who in our real life are merely admired or respected may still be sexual objects for our unconscious.

Thus the solution of the puzzle is that transference to the doctor is suitable for resistance to the treatment only in so far as it is a negative transference or a positive transference of repressed erotic impulses. If we 'remove' the transference by making it conscious, we are detaching only these two components of the emotional act from the person of the doctor; the other component, which is admissible to consciousness and unobjectionable, persists and is the vehicle of success in psycho-analysis exactly as it is in other methods of treatment. To this extent we readily admit that the results of psycho-analysis rest upon suggestion; by suggestion, however, we must understand, as Ferenczi (1909) does, the influencing of a person by means of the transference phenomena which are possible in his case. We take care of the patient's final independence by employing suggestion in order to get him to accomplish a piece of psychical work which has as its necessary result a permanent improvement in his psychical situation.

The further question may be raised of why it is that the resistance phenomena of transference only appear in psycho-analysis and not in indifferent forms of treatment (e.g. in institutions) as well. The reply is that they do show themselves in these other situations too, but they have to be recognized as such. The breaking out of a negative transference is actually quite a common event in institutions. As soon as a patient comes under the dominance of the negative transference he leaves the institution in an unchanged or relapsed condition. The erotic transference does not have such an inhibiting effect in institutions, since in them, just as in ordinary life, it is glossed over instead of being uncovered. But it is manifested quite clearly as a resistance to recovery, not, it is true, by driving the patient out of the institution - on the contrary, it holds him back in it - but by keeping him at a distance from life. For, from the point of view of recovery, it is a matter of complete indifference whether the patient overcomes this or that anxiety or inhibition in the institution; what matters is that he shall be free of it in his real life as well.

The negative transference deserves a detailed examination, which it cannot be given within the limits of the present paper. In the curable forms of psychoneurosis it is found side by side with the affectionate transference, often directed simultaneously towards the same person. Bleuler has coined the excellent term 'ambivalence' to describe this phenomenon.¹ Up to a point, ambivalence of feeling of this sort seems to be normal; but a high degree of it is certainly a special peculiarity of neurotic people. In obsessional neurotics an early separation of the 'pairs of opposites' seems to be characteristic of their instinctual life and to be one of their constitutional preconditions. Ambivalence in the emotional trends of neurotics is the best explanation of their ability to enlist their transferences in the service of resistance. Where the capacity for transference has become essentially limited to a negative one, as is the case with paranoics, there ceases to be any possibility of influence or cure.

¹ Bleuler, 1911, 43-4 and 305-6. - Cf. a lecture on ambivalence delivered by him in Berne in 1910, reported in the *Zentralblatt für Psychoanalyse*, 1, 266. - Stekel has proposed the term 'bipolarity' for the same phenomenon.

In all these reflections, however, we have hitherto dealt only with one side of the phenomenon of transference; we must turn our attention to another aspect of the same subject. Anyone who forms a correct appreciation of the way in which a person in analysis, as soon as he comes under the dominance of any considerable transference-resistance, is flung out of his real relation to the doctor, how he feels at liberty then to disregard the fundamental rule of psycho-analysis which lays it down that whatever comes into one's head must be reported without criticizing it, how he forgets the intentions with which he started the treatment, and how he regards with indifference logical arguments and conclusions which only a short time before had made a great impression on him - anyone who has observed all this will feel it necessary to look for an explanation of his impression in other factors besides those that have already been adduced. Nor are such factors far to seek: they arise once again from the psychological situation in which the treatment places the patient.

In the process of seeking out the libido which has escaped from the patient's conscious, we have penetrated into the realm of the unconscious. The reactions which we bring about reveal at the same time some of the characteristics which we have come to know from the study of dreams. The unconscious impulses do not want to be remembered in the way the treatment desires them to be, but endeavour to reproduce themselves in accordance with the timelessness of the unconscious and its capacity for hallucination. Just as happens in dreams, the patient regards the products of the awakening of his unconscious impulses as contemporaneous and real; he seeks to put his passions into action without taking any account of the real situation. The doctor tries to compel him to fit these emotional impulses into the nexus of the treatment and of his life-history, to submit them to intellectual consideration and to understand them in the light of their psychical value. This struggle between the doctor and the patient, between intellect and instinctual life, between understanding and seeking to act, is played out almost exclusively in the phenomena of transference. It is on that field that the victory must be won - the victory whose expression is the permanent cure of the neurosis. It cannot be disputed that controlling the phenomena of transference presents the psycho-analyst with the greatest difficulties. But it should not be forgotten that it is precisely they that do us the inestimable service of making the patient's hidden and forgotten erotic impulses immediate and manifest. For when all is said and done, it is impossible to destroy anyone *in absentia* or *in effigie*.

RECOMMENDATIONS TO PHYSICIANS PRACTISING PSYCHO-ANALYSIS

RECOMMENDATIONS TO PHYSICIANS PRACTISING PSYCHO-ANALYSIS

The technical rules which I am putting forward here have been arrived at from my own experience in the course of many years after unfortunate results had led me to abandon other methods. It will easily be seen that they (or at least many of them) may be summed up in a single precept. My hope is that observance of them will spare physicians practising analysis much unnecessary effort and guard them against some oversights. I must however make it clear that what I am asserting is that this technique is the only one suited to my individuality; I do not venture to deny that a physician quite differently constituted might find himself driven to adopt a different attitude to his patients and to the task before him.
